Though it is somewhat late in the day to come forward with courses for the Vanderbilt Cup race and obtain the consent of the donor of the cup to the holding of the event in the far West, the latest proposals are from Nevada and Colorado. Of course, there is nothing to prevent the automobilists of those States from conducting road races of their own, but they seem to think that the Vanderbilt event is far more desirable.

#### What the Gold Diggers Can Offer.

The *Examiner* prints the following:

CHICAGO, Aug. 17.—If "Tex" Rickard and Capitalist Coburn have their way about it, the Vanderbilt Cup race of 1907 will go to Nevada. Rickard, Coburn and a party of automobilists met at the Annex last night. The upshot of the pow-wow was a decision on the part of Rickard and Coburn to start for Goldfield to-day and rush the plans through. They propose to raise \$50,000 for the purpose, and are positive they can do this.

The Nevada course will be twenty-eight miles in length, and wide enough to permit ten or more cars to race abreast. The course circles a dry lake, and is perfectly level, the turns being about three miles long. Rickard proposes to build a great amphitheater in the center, and spectators with field glasses will be able to watch the race from beginning to end.

Messrs. Rickard and Coburn will have photographs made at once of the course and will forward them to A. R. Pardington, acting chairman of the Racing Board of the A. A. A., together with a definite offer to hold the race. They point out that population considered the mining camp of Goldfield has more automobiles than Chicago and that faster time is made there daily than on most of the race tracks in the country.

The motorists present at the meeting last night thought that the high altitude would have an effect on the drivers and this is one of the points that will have to be considered. While Rickard and Coburn will push the matter, the absence of W. K. Vanderbilt, Jr., and Racing Chairman Thompson in Europe is apt to have a bad effect on the outcome.

#### What Colorado Can Supply.

DENVER, COLO., Aug. 17.—G. A. Wahlgreen, editor of *Motor Field*, has "wired" the Commission on the Vanderbilt Cup race, which New Jersey has repudiated, that he can give them a course at Denver, either from Denver to Colorado Springs and return, a distance of two hundred miles, or a course ten miles east of the city, guaranteeing the best of patrolling by State or Federal troops. Mayor R. W. Speer, who has championed the cause of good roads for the benefit of automobilists, not only in Denver, but in all points out of Denver, is co-operating with Mr. Wahlgreen in his efforts to furnish the contestants with a safe course. Governor Buchtell of Colorado also favors the proposal. The Twenty-second Infantry, now at Fort Logan, may be used.

Western people are interested in constructing a boulevard on the route from Kansas City to Colorado Springs, like the old Roman roads, for eastern and western automobilists. The road is intended to connect with the national highway.

### THOMAS B. JEFFERY STARTS A SIGN CAMPAIGN.

KENOSHA, WIS., Aug. 17.—Next to improvement, Wisconsin roads need signboards more than anything else, and as little or no progress has been made thus far in properly marking them, Thomas B. Jeffery, of T. B. Jeffery & Company, makers of the Rambler automobiles, has undertaken a progressive campaign for this purpose, having set aside a fund of \$25,000 to carry it out. He will not confine attention to Wisconsin, but will also mark Illinois roads, and the Rambler agents in both States will undertake the work of erecting the guide posts immediately. The signs will be placed at every intersection, as well as at every danger point, and such signs will state the nature of the danger, while many of the Illinois signs will also give the legal speed limits.

### THE STORY OF AN UNPAID 24-HOUR PRIZE.

Before the finish of the 24-hour race at Brighton Beach, N. Y., August 9-10, W. H. Pickens, manager of the United States Motor Racing Association, endeavored to disgorge \$1,000 in bills of various denominations, but several officers of the Long Island Automobile Club, whom he asked to receive the big prize of the "twice around the clock race," declined becoming a depository for the twenty-four hours which would have to elapse after the conclusion of the race before the prize money could be paid to the winner. Therefore, Mr. Pickens redeposited the money with President Joseph M. Gaites, of the United States Motor Racing Association.

It happens that Messrs. Gaites and Pickens are also engaged in the theatrical business, and recently arranged to present a version of "Raffles," the famous cracksman. In the production of the play containing this famous personage, it seems that a copyright misunderstanding has arisen, and resulting from it a suit which has made necessary a temporary deposit of a round sum of money. Thereupon, the funds of the United States Motor Racing Association were drawn upon, and as late as Wednesday morning Montagu Roberts, the winner of the 24-hour event, was still looking for his prize money, though it was stated that the matter would be attended to in the next day or so.

As soon as Acting Chairman Pardington heard, Tuesday noon, of the failure of the promoters to straighten out the prize money, a formal complaint having been filed by the Harry S. Houpt Co. in behalf of Roberts, he immediately endeavored to get into communication with Messrs. Gaites and Pickens, but failed to do so owing to their absence from the city.

Prompt punishment will be meted out to the promoters unless the unpaid prize money and cups are attended to at once. In any event, Roberts will not lose his prize money, for Mr. Bowles, of the Houpt Company, says he will pay the plucky driver out of his own pocket if the United States Motor Racing Association fails to meet its obligations. It is the general belief that since the matter has been brought to the official attention of the A. A. A. Racing Board, the U. S. M. R. A. will quickly comply with the demand made for a prompt settlement of all prizes.

### MAXWELL'S SEALED-BONNET PERFORMANCE.

The performance of the 16-20-horsepower Maxwell car, driven by Charles W. Price, has rolled up such a tremendous mileage that it now stands above all the other sealed bonnet performances, the distance covered being close to 5,000 miles. The seals were originally affixed June 28, and since then Price has successfully competed in various sealed bonnet contests, running the car from city to city to do so, competing under the ominous "No. 13." It was run in the Chicago reliability contest, the Peoria 6-hour race, the Chicago 24-hour race, and was then driven in the A. A. A. tour, again returning from New York to Chicago. The seals were affixed by Charles P. Root, chairman of the Contest Committee of the Chicago Motor Club, and David Beecroft, chairman of the Technical Committee of the same organization. They were also frequently examined by the same committeemen, who have gone on record as certifying to the genuineness of the performance throughout. The car's total mileage is given as 4,788.6. After a rest it is Price's intention to continue through the West and South, probably going clear to the Coast.

### P. R. R. TO INSTALL MOTOR CAB SERVICE.

ALTOONA, PA., Aug. 19.—Though it has not been officially announced as yet, the Pennsylvania Railroad has made all preparations for substituting motor cabs for the horse-drawn hansoms and coupés so long used in its service at the principal stations. What is even more significant is the fact that it is going to build its own motor cabs, arrangements being about completed to construct them at the Juniata shops at Altoona. One department of the shops will be devoted entirely to their construction.

### TORONTO HOLDS A SUCCESSFUL ORPHANS' DAY.

TORONTO, ONT., Aug. 17.—Instead of being a fixed celebration, Orphans' Day has come to be regarded as a sort of movable feast, the Ontario Motor League making the date of its annual event on Wednesday last, when an unusually successful observance of the new institution was held. Some 500 children from the Protestant Orphan Home, the Girls' Home, the Sacred Heart Orphanage and the Children's Aid Society were treated to a day's outing that they will long cherish the memory of in times to come. It was a bright spot such as seldom enters into the lives of these waifs. Sixty cars gathered at the quarters of the Ontario Motor League, from which they were dispatched to the various homes to receive their burdens of happy children. This accomplished, the procession lined up at 11:30 A.M. and, after passing through a number of the principal streets of the city, wound up at Scarboro Beach Park at 1 o'clock.

The weather man had done his best and conditions could not have been better. The cars were gaily decorated and each urchin was presented with a small flag with which to help celebrate, so that the passing of the procession was a sight that attracted large crowds along the entire route. The arrangements all went smoothly until the arrival at the park, where it was found that the "grub wagon" had defaulted in some way or other, and what is an outing without something to eat, particularly when one is gifted with the appetite that goes with but ten or twelve summers of life? The lunch had been loaded on a motor truck, which was to have preceded the parade to the park, but there was no sign of it on arrival there. It had gone astray, but was soon located and the delay only served to increase the edge on the waiting appetites. Once the important ceremony of disposing of the edibles had been completed, the children were given *carte blanche* to enjoy themselves in their own way, every show on the grounds being open to them, the park management concluding the entertainment with a representation of the San Francisco earthquake. Toronto's business interests contributed liberally to the celebration, the refreshments all being donated by various local houses, even in-

cluding a supply of souvenirs, consisting of a doll for each girl and a rubber ball for each boy. The affair was excellently managed by the Motor League, the special committee consisting of the following members: Noel Marshall, William Dobie, R. J. Christie, T. A. Russell, G. H. Gooderham, M. C. Ellis, H. C. Osborne and Harton Walker.

### A. M. C. M. A. SHOW SPACES TO BE DRAWN AUG. 30.

All applications for space at the eighth annual show of the Automobile Club of America, to be held at the Grand Central Palace October 24-31, and in which members of the American Motor Car Manufacturers' Association are the chief exhibitors, must be received at the office of the latter association by Wednesday, August 28, as the drawing for spaces is scheduled for two days later and will take place at the association's headquarters, 29 West Forty-second street. At the show itself a new system of admission for exhibitors and their assistants will be inaugurated, and as it is to be used at all automobile shows this season its first trial at the Palace will be watched with interest. It is known as the double check system and consists of the use of a badge and ticket, which will be supplied exhibitors as applied for. The badge is not good for admission alone, but must be shown and the ticket delivered at the door. On passing out, showing the badge entitles the holder to a return ticket, which must again be given up on re-entering.

### PREPARATIONS FOR THE IMPORTERS' SALON.

An entirely new scheme of decoration is to be supplied for the Importers' Automobile Salon, to be held in Madison Square Garden, December 28-January 4. The S. R. Ball Company has been given the contract and promises something so novel that the well-known interior of Madison Square Garden will not be recognized by its oldest frequenters.

Tuesday, December 31, and Friday, January 3, have been decided upon as the days when the \$1 admission will be charged. On the other days the regular 50-cent fee will be in effect.

LINING UP THE ORPHANS' DAY PARADE IN QUEENS PARK, TORONTO, PRIOR TO THE START.

### GASTON PLANTIFF'S NEW YORK RECORD.

Ford runabouts and "sixes" to the value of \$190,059.43 constitute the enviable July record of Manager Gaston Plantiff, of the New York branch of the Ford Motor Car Company, Detroit, Mich. And that is only one month, so that Manager Plantiff holds other records as well. During the ten months dating from October 1, 1906, the beginning of the Ford fiscal year, he has disposed of some \$920,000 worth of Ford cars. This means 1,400 runabouts and 130 six-cylinder touring cars, nearly 1-7 of the entire Ford output for the year. Six weeks still remain of the latter, and in them Mr. Plantiff is confident that he can pass the million-dollar mark, thus establishing another record.

In speaking of his achievements in this line, Mr. Plantiff says: "I believe this record has never been equaled in the automobile business, for it must be remembered that with us July deliveries mean July sales. Nothing is carried over, and only those sales are included in the month's report which have been made and delivered in that month. This is not the case in a great many instances, many concerns concentrating their deliveries in one or two of the spring months.

### THE MORRIS PARK MOTORDROME.

The Morris Park Motordrome Club, of New York City, is to revive automobile racing on the once-famous Westchester running course. The Morris Park property is owned by the Fidelity Development Company, of which J. G. Robbins is the president, and he will also occupy the same position at the head of the new racing club, with Walter C. Allen as its secretary.

Alfred Reeves, well known as a promoter of many successful meets in the metropolitan district, has consented to serve as chairman of the race committee, assisted by A. B. Tucker as racing secretary, while A. F. Camacho will be the track superintendent, thus insuring a most competent trio for the competitive branch of the enterprise.

The first meet is to be a 24-hour race, September 6-7, preceded by several shorter races and a series of gymkhana games. A number of the most prominent trade and racing men have been asked to officiate at the 24-hour track race, and there will be special lighting of the track for the night hours and special treatment of the track by extra banking and thorough oiling for the races. The new organization promises to leave no stone unturned to make the races to be held at Morris Park the most notable, both in entries and officials, and the most carefully conducted of any ever held in or near the city.

### A CHADWICK AGENCY FOR CHICAGO.

PHILADELPHIA, Aug. 19.—H. B. Larzelere, of the Fairmount Engineering Works, has just returned from Chicago, where he located the Chadwick agency with the Hamilton Automobile Co.

MORRIS PARK TRACK IS NOW HAVING ITS NEEDED SHAVE.

LOADING THE STEVENS-DURYEA BIG SIX ON THE FLAT CAR.

### VISITING ATLANTIC CITY EN ROUTE TO CAPE MAY.

OCEAN CITY, N. J.—Aug. 19.—Almost every tourist going from New York City to Cape May has found it impossible to take in Atlantic City on the way without making a very long detour to avoid the bad roads between Atlantic City and Ocean City. The distance, as the bird flies, from Somers Point, just below Atlantic City to Ocean City, directly across the mouth of the inlet is 2 1-10 miles, but the distance by the road is 27 sandy miles.

The Shore Fast Line Trolley Company, July 2, started running a trestle and dike route from Somers Point to Ocean City. August 3 was opened up a flat car service to carry automobiles across the two miles of trestle. The first car to cross was a Stevens-Duryea "Big Six," driven by S. H. Hancock. In the party were C. J. Neff, general superintendent of the electrified lines of the Pennsylvania Railroad; Frank A. Broadhead, secretary and treasurer of the Atlantic Automobile Company; A. E. Corbin, of the Stevens-Duryea Company; James C. Ash, and D. J. Jameson.

### FIRE AT THE PREST-O-LITE PLANT.

INDIANAPOLIS, Aug. 19.—One of the five factories of the Prest-o-Lite Company, in this city, was damaged to the extent of \$25,000 by fire Saturday, August 19. President Carl G. Fisher, of the company, who was at the New York City plant at the time of the fire, makes the announcement that the company's customers will not suffer any inconvenience, as thousands of charged tanks are kept in readiness for immediate delivery from any of the other main pumping stations of the company, at New York, Boston, Toronto and San Francisco. The fire was very spectacular. The heat, of course, melted the little safety caps at the end of each tank that was charged, and released the gas, which burned furiously. Fortunately, no one was killed or even seriously injured. The Indianapolis plant will be reconstructed immediately.

### STOCKBRIDGE TO BECOME A WHITE STEAMERITE.

PHILADELPHIA, Aug. 19.—Frank W. Stockbridge, formerly connected with the Reo agency in New York and this city, and later in charge of the Cadillac business of the Foss-Hughes Motor Car Company here, has been secured by the local branch of the White Company and will act as factory representative in this section, looking after the agencies and sub-agencies in the eastern part of this State. Mr. Stockbridge will take up his new duties next week, going to the Cleveland factory first to familiarize himself with the latest improvements in the White system.

### SPALDING TO SELL STEVENS-DURYEA IN PHILA.

PHILADELPHIA, Aug. 19.—A. G. Spalding & Bros. have secured the local agency for the sale of the Stevens-Duryea.

APPLE DYNAMO APPLIED TO A SIX-CYLINDER FRANKLIN.

### APPLYING A DYNAMO TO A SIX-CYLINDER CAR.

What constitutes a rather unique illustration of the adaptability of the Apple dynamo and its flexible driving connection is shown by the accompanying photograph depicting one of these small direct-current generators installed on a Franklin six-cylinder car. It will be noticed that the large flexible shaft permits of locating the dynamo some distance from the engine flywheel from which it is driven. The automatic governor is at the shaft end at this drive and makes contact with the flywheel. Provision is made so that the necessary adjustments may be made for charging the batteries at the proper rate while the motor is running. The dynamo itself is placed well forward on the right side of the engine, while the driving shaft extends rearward toward the flywheel, as shown, both being thoroughly protected by a dust and waterproof casing, the brush end of the generator being readily accessible through a hinged end cover. The entire output of the machine is used for storing a set of accumulators, the current from which is employed both for ignition and lighting the side lamps shown on the car.

### SECRETARY OF WAR TAFT LIKES THE WHITE.

One of the fixtures of the "summer capital" at Oyster Bay, ever since President Roosevelt's return to his home on June 12 last, has been two 30-horsepower White steamers, fitted with seven-passenger Pullman bodies. They are "on the job" every day in the week from 7 A. M. to 1 o'clock the next morning, and the reception they meet with at the hands of the various government officials who are conveyed in them is often amusing. "A regular government star route conveyance" is the way Secretary of War Taft characterized them to Postmaster-General Meyer, as they entered one of the cars at the Oyster Bay station last

SECRETARY OF WAR TAFT IN WHITE STEAMER AT OYSTER BAY.

week. There is a sign at the gate to the presidential estate which reads "No Automobiles Allowed," but it does not apply to the two government White steamers, and in a few minutes the two cabinet officials had reached the house.

"I wish Sagamore Hill was further away from the station," remarked the Secretary of War. "Well," replied the President, "it is quite a distance from the station at Long Island City, and when you go back there is no reason why you should not go all the way in the machine." And go back all the way he did, not alone to Long Island City, but over the ferries until the Pennsylvania Railroad depot was reached. The White machines are considered absolutely indispensable to the expeditious handling of government work at Oyster Bay, and one or both of them meet every arriving train all day long, beside performing numerous other forms of service.

### SPECIAL TOPS FOR HIGH-POWERED RUNABOUTS.

It is only natural that with the very general demand for the high-powered, four-cylinder runabouts there should also be a call for a special type of top adapted to this style of car. To meet this demand the Rands Manufacturing Company, Detroit, Mich., has just brought out a top of this kind, which is shown on a car in the accompanying photograph. There is no bow extending from the side of the seat to the front part of the top, thus avoiding any obstructions that would prevent free ingress and

HOW THE RANDS SPECIAL TOP LOOKS WHEN IN POSITION.

egress from the car. The top of the hood is also made long enough to extend over the dashboard of the car, so that when used with a windshield or storm front it will give the same result as a coop top for stormy weather, and is an ideal equipment for physician's use. The operation of raising or lowering the top only involves the use of two thumb screws, which are loosened from their position at the upper part of the center socket, and placed at the bottom of the same socket, or vice versa. When folded it is more compact than any style of top yet produced. For cold weather use the top is so constructed that two side curtains can be attached to the edge of the front seat with suitable fasteners which may be permanently put in place.

### COUZENS RETURNS FROM EUROPE.

James Couzens, secretary and treasurer of the Ford Motor Company, and also manager of its sales department, yesterday arrived home from the other side. Two months ago he began a tour of Continental Europe and Great Britain for the purpose of studying conditions there and laying plans for a big export business in Ford cars. During the time he was away Mr. Couzens visited every country and every city of importance in the old world. The Ford company is already a large exporter of motor cars, shipping regularly twenty-four runabouts per week to London, sixteen to Berlin and eight each to Paris, Milan and Brussels. Mr. Couzens' trip will result in multiplying these numbers as well as opening up much territory never before reached by American automobile manufacturers.

### ACTIVITIES OF THE NEW YORK TRADE ASS'N.

Three additions have been made to the membership of the New York Automobile Trade Association; Cimiotti Bros., agents for the Mora car; Corbin Motor Vehicle Corporation agency, and the Waltham Manufacturing Company agency.

The present officers of the association are: President, Percy Owen, of Percy Owen, Inc.; first vice-president, Frank Eveland, of A. G. Spalding & Bro.; second vice-president, E. C. Partridge, of Wyckoff, Church & Partridge; treasurer, W. P. Kennedy; secretary, and general manager, E. V. Stratton. The headquarters are in the Motor Mart, Broadway and Sixty-second street, and the telephone number is 3743 Columbus.

The association has just established a collection department for the benefit of its members, and has under consideration the organization of an employment bureau through which members may secure reliable salesmen, mechanics and chauffeurs.

### EARL ROADSTERS BEING BUILT IN KENOSHA.

Kenosha, Wis., is now the home of another popular-priced car, known as the Earl Roadster, which formerly claimed Milwaukee as its home. The object of the manufacturers in producing this car has been solely to turn out a vehicle that should be light, powerful, durable and speedy, at a moderate selling price, as well as one capable of being maintained at a minimum cost. That they have succeeded in this will be quite evident from a review

EARL LIGHT ROADSTER FOR 1908 WITH FOLDING SEAT.

of the following specifications: The motor is of the horizontal, double-opposed type, located under the hood forward, and is rated at 15 horsepower. The ignition is of the high-tension type, current being supplied by two sets of dry cells, carried in a battery box on the running board.

The transmission is of the friction type, providing four forward speeds and reverse, all of which are controlled by a single side lever in much the same manner as a sliding gear. The friction wheel is carried on a countershaft, on the ends of which are two sprockets for the final drive, which is by means of special silent chains. Two sets of brakes are provided, the running brakes being in the rear hubs. A channel section, pressed steel frame forms the foundation of the chassis, which is carried on four full-elliptic springs of liberal dimensions and which in turn are supported on 30 by 3-inch artillery wheels and clincher tires of this size, front and rear. The wheelbase is 100 inches and the weight of the car all on is 1,200 pounds. The control is by the usual small levers on a stationary sector over the steering wheel, and the car is capable of a speed of 40 miles an hour. Complete with the usual full equipment of lamps, it lists at \$950.

### SWINEHART TIRES TO BE MADE IN EUROPE.

During his recent European business trip, B. C. Swinehart, vice-president of the Swinehart Clincher Tire and Rubber Company, of Akron, O., made arrangements with a European concern to manufacture Swinehart tires abroad. During his three months' stay Mr. Swinehart also negotiated the sale of German patents to Metzeler & Company, Munchen, Bavaria.

FIRST 1908 LOCOMOBILE GOING TO FINAL FINISH TEST.

A. L. Riker, designer, is seated in the tonneau. J. A. Kingman, advertising manager, holds down the running board, and "Bill" Hall is the driver.

### ENGLISH CONCERN TO ESTABLISH PLANT HERE.

KANKAKEE, ILL., Aug. 19.—It is reported here that the plant of the defunct St. Anne Kerosene Motor Company has been acquired by an English firm, which will take possession on September 1. The firm is now said to operate a plant in Wales and that its specialty is an automobile wheel, besides which it builds high-priced cars, the intention being to carry on both branches here. Color is lent to the report by the fact that a representative of the Stepney Spare Motor Wheel, Ltd., of Llanelly, South Wales, has been in this country for the past two or three months gathering statistics as to the extent of the American industry, and visited the offices of THE AUTOMOBILE before sailing.

### NEW MODEL BLOMSTROM RUNABOUT FOR 1908.

Having studied out the design of the Blomstrom "Thirty" well in advance, covering every possible point of practise as exemplified by current usage on a large number of cars, the only change to be made in the Blomstrom cars for 1908 will consist of a slight increase in the size of the cylinders, which are now being made 4 5-8 inch bore by 4 1-2 inch stroke, with a consequent increase in the power of the motor. A few other detailed refinements have been found possible here and there, though with the exception of the increase in the size and power of the motor the car remains essentially the same as described in these columns several months ago. The appearance of the new Blomstrom runabout for 1908, which will be a strong feature of the line, may be judged of from the accompanying photograph.

1908 BLOMSTROM "30," FITTED WITH CAPE TOP.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Health and Street Cleaning Departments of New York City have just purchased three Lozier 40-horsepower cars.

The Gearless "Big 6" has arrived in Chicago, and its huge length of bonnet and snow white color was the sensation in automobile circles there last week.

The partnership known as the O. G. Roberts Automobile Company, with quarters at Ninth street, Columbus, O., has just been dissolved by O. G. Roberts buying out the interest of his partner, Richard Hammond. Mr. Roberts will continue the business at the same place without change.

By reclaiming a fifty-acre tract of sand flats lying southeast of its present plant, the Locomobile Company of America will be enabled to double its land holdings on the water front at Bridgeport, Conn. The new land will permit extensive factory additions from time to time and also make possible a 140-foot pier into the harbor.

It has been objected that 24-hour races really prove nothing and therefore are not helpful either to the sport or to the industry. To this A. R. Pardington, speaking unofficially, makes the rejoinder: "But why should there not be some purely entertaining or spectacular feature to the sport. If the public finds such events interesting, I can see no objection to professional promoters catering to this portion of the public."

The Milwaukee Motor Company, at present located at 615 Clybourn street, Milwaukee, Wis., will commence to move to their large new factory at Thirty-second and Burleigh streets shortly. It is the intention to install new machinery in the new plant and have it running before the old factory is dismantled preparatory to moving, so that there shall be no cessation of work that is usually incident to moving a large plant.

Judging from present conditions at the factory of the Electric Vehicle Company, Hartford, Conn., there would seem to be little, if any foundation, for the alleged rumor that the limousine body was becoming passé. Instead of being a winter equipment alone, there are a great many users who now specify limousine bodies for both summer and winter use, the lowering of the liberal-sized windows readily converting the car into practically an open type with little trouble.

The great possibilities attending the use of automobiles as conveyors of mail over rural free delivery routes were clearly shown by a recent test made at South Bend, Ind. The route selected was 25 miles long, numbered 115 families and is said to be the hardest in St. Joseph county, Ind. With a horse and wagon eight hours are required for the carrier to get over this route, but in the recent test the mail carrier drove a Studebaker electric and covered it easily in three hours.

Owing to the need for expansion, the H. H. Franklin Manufacturing Company, Syracuse, N. Y., has just leased the old Syracuse bicycle plant in that city for a term of two years. There are two buildings, one 132 by 40, five stories high, and another 80 by 32, four stories high, giving a combined floor space of 35,000 square feet. The new quarters are to be devoted

to the sundry stock department and the painting and finishing department, and more men will be added to the working force, together with the increased facilities.

The recently organized Winston Automobile Company has just opened for business in Charlotte, N. C., and forms a notable addition to the State's automobile establishments. The large building on the corner of Fourth and Elm streets has been renovated, and is now fully stocked with cars and accessories, Joseph Hamlin, the manager of the company, was with the Forsyth Sporting Goods Company for some time, beside being known as one of the best mechanics and auto experts in the State.

The Empire State Tire Company is the title of a new concern just organized in Buffalo, N. Y., for the purpose of manufacturing a puncture-proof tire. It is capitalized at \$20,000, and a factory site is now being looked for in Buffalo. The construction of the new tire involves the use of jointed, copper-plated, steel discs arranged in the tread or layer of rubber, without interfering with the flexibility of the latter, and placed so as to practically form a continuous band, thus effectively preventing punctures.

Muncie, Ind., has an acquisition which most of the citizens knew little or nothing about until it had actually happened. This is the location of the Rider-Lewis Motor Car Company, which has rented the plant of the old Anchor Silver Plate Company, and is already converting it into an automobile factory. The plant is expected to be ready by about the middle of September and the first cars are promised for early in October. They will be six-cylinder cars from the designs of Ralph C. Lewis. The company was recently incorporated with a capital of \$150,000, the incorporators being William A. Rider, Indianapolis; Ralph C. Lewis, Muncie; George D. Rider, Kentland, Ind.; R. E. Stevenson, Muncie, and Hiram D. Lingle, Denver, Col. The incorporators are also the directors.

It is interesting to note that the longest endurance run ever undertaken, the race from Pekin to Paris—a distance of more than 6,000 miles over a trackless wilderness—was made in a car provided at every point with ball bearings. These were of the D. W. F. German make and their performance is noteworthy, as owing to the necessity of carrying everything in the shape of supplies, the car was extremely heavy. The Hess-Bright Manufacturing Company, Philadelphia, is just in receipt of a cable from the home office in Berlin as follows: "Prince Borghese made automobile trip, Pekin-Paris, on our bearings, which stood up excellently without replacement." The Italian victor of the longest race ever run was also enthusiastic over the good qualities of Vacuum Mobiloil, which he used throughout the entire trip with great satisfaction.

### NEW AGENCIES ESTABLISHED.

Buckwalter & Burnell are the new agents for the Stearns line in Chicago, and have opened quarters in the salesrooms formerly occupied by the Buick agency at 1412 Michigan avenue.

The Tokheim Manufacturing Company, Cedar Rapids, Iowa, have opened

a Chicago branch on "Automobile Row," and intend to make a strong campaign for business in Chicago and that city's adjacent territory.

It has been reported that the H. H. Franklin Company, of Syracuse, N. Y., in opening new branch headquarters in New York City, would occupy the premises recently vacated by the Aerocar Company, but instead they will be situated in the Severn Building, located at the southeastern corner of Broadway and Seventy-third street, extending to Amsterdam avenue and facing on Sherman square, so that while not in the same building, the new salesrooms are in the immediate locality indicated.

September 1 the Winton Motor Carriage Company, of Cleveland, O., will open a branch house of its own in San Francisco, Cal. A new building occupying the territory on Van Ness avenue, between Birch and Grive streets, has been in course of construction after plans drawn for the Winton company, and is now nearing completion. The site is within a block of the city hall, thus opening up a new automobile center, while the structure itself will be both ornate and spacious, furnishing one of the finest automobile homes on the coast. Charles M. Brown, who scored so highly as manager of the Winton company's Chicago branch, is to have charge of the new establishment, and will have under him a staff largely recruited from the Winton factory. Harry L. Owsney, late of Cook & Owsney, and since district supervisor for the Winton company, will be Mr. Brown's chief lieutenant. Mr. Brown's successor in Chicago will be B. C. Day, who has been associated with that department for several seasons. The new San Francisco branch is the tenth establishment maintained by the Winton company, others being situated in London, New York, Boston, Philadelphia, Pittsburg, Cleveland, Detroit and Seattle.

### PERSONAL TRADE MENTION.

W. H. Dougherty, for some time connected with the head office of the G & J Tire Company, Indianapolis, Ind., has recently severed his connection with concern.

R. A. Wadsworth, formerly of the Excelsior Supply Company of Chicago, has been engaged by the Buick Motor Company, Chicago branch, as manager of the accessory department, and will install a full line of accessories and supplies at once.

F. J. Pardee announces his resignation as sales manager of the St. Louis Car Company, to take effect September 1, and though it is understood he has already been placed in a similar rôle with another well known concern, no details are forthcoming at the moment.

Ernest Waterman has just been appointed sales manager for the Hartford Suspension Company, manufacturers of the Hartford-Truffault shock absorbers, and as the number of manufacturers who are now employing the latter as a part of the regular equipment of their cars, as well as the jobbers and dealers, who are handling the Hartford, is rapidly increasing, Mr. Waterman will doubtless find plenty to do.

INFORMATION FOR AUTO USERS.

**Hotchkin Anti-Jolt Device.**—For the season of 1908 the Hotchkin Manufacturing Company, 1256 Michigan avenue, Chicago, will market two models of the well-known Hotchkin Anti-Jolt Device, to be designated as Model 100, the type which the automobiling public has already become familiar, and Model 101, which

MODEL 100, HOTCHKIN ANTI-JOLT.

though given a separate number really only differs from the standard type in the manner of its attachment to the car, and the makers call attention to the fact that it is somewhat of a novelty nowadays to find a mechanical appliance so perfect when first put on the market that it is found profitable to put it out year after year without a single change in its vital essentials. The anti-jolt absorbers, for use on the rear axle, incorporate the attachment referred to, enabling them to be bolted to the chassis frame by simply drilling holes in the latter, the connection with the axle being made by a link together with a collar or other suitable part, as shown in the illustration. The old method of installation was found to present difficulties on some cars that could not be overcome by the mechanic entrusted with the job, hence this reversal of the method of attachment for the rear absorbers was determined upon, though both models will be made and supplied, according to the car to which they are to be fitted. The principle of the Hotch-

MODEL 101, HOTCHKIN ANTI-JOLT.

kin is that of forcing glycerine alternately through a large valve and a needle valve, through a small opening which may be diminished or increased to suit the weight of the car. It exerts no retarding motion while the springs are being depressed, but merely retards the throw of the springs after compression, the enclosed piston working radially like the spokes of a wheel.

**Springfield Motometer's New Models.**—The R. H. Smith Manufacturing Company, Springfield, Mass., makers of the Springfield motometer, are showing their progressiveness by the addition of several new and valuable features to this ster-

ling auto accessory. The most important of these is the new "maximum hand," which, as its name indicates, is a supplementary pointer traversing the vertical scale with the regular indicator but which remains at the maximum or highest speed attained, from which it may be instantly released by pressing a button. On dropping, it again returns to the point at which the regular indicator happens to be at the time. It can also be made inoperative by equally simple means, so that it travels up and down the scale together with the regular indicating hand, not even being visible to confuse the observer. The vertical scale of the motometer is well adapted to the application of a device of this nature and full advantage has been taken of that fact. In conjunction with this new indicator, the motometer will also be supplied with

THE NEWEST SPRINGFIELD MOTOMETER.

what extensive study and experiment has shown to be the very best form of dial, the new scale being calibrated with figures fired on in jet black enamel against a pure white background. Improvements have also been made in the transmission by the addition of a new tempered steel reinforcement at each end of the shafting, forming a protection against the short bend or kink at these points that is so fatal to any flexible shaft. The use of oil-tempered steel spring stock in the shaft also gives more room for the latter and produces better action under flexion. An innovation of unusual merit is to be found in the adoption of a self-clearing or rather non-clogging pinion in connection with the hub transmission, and which after exhaustive tests has been found not to clog under the most severe road conditions. So far as the appearance of the motometer or its essential features are concerned, these have undergone no changes whatever, and it will be noted that those described are rather in the nature of detailed refinements suggested by experience than radical changes necessitated by difficulties encountered, as all of them may readily be added to any of the models of the motometer now in current use.

**Springfield Ratchet Screw Jack.**—The latest product brought out by the Shawver Company, Springfield, O., is a powerful ratchet screw jack for cars weighing from 1,000 to 4,000 pounds. The base is of malleable iron, heavily ribbed and is made dust proof, while the screw is of the regulation type, being of steel with a four-

SPRINGFIELD RATCHET SCREW JACK.

pitch, square thread. The height of the jack over all is 12 inches, and its extreme rise 7 inches. The ratchet works in a grease-tight, malleable casing, from which both screw and ratchet are lubricated, one filling being sufficient for a season's use. The ratchet is made of steel and hardened. As shown by the accompanying illustration, when not in use, the jack is most compact, requiring very little room in the tool box, and as all its parts are securely locked together, it is absolutely rattle-proof.

**Robert Spark Plugs.**—The Robert Instrument Company, 56 Shelby street, Detroit, Mich., has just added a new specialty to its line of auto specialties in the shape of a spark plug for which many advantages are claimed. The insulation is composed of the best East Indian white transparent mica, and from the

NEW ROBERTS SPARK PLUG.

extended study the makers have given the problem of spark plug construction, they claim that the vertical mica wrapping around the shank of the plug, over which the body of the insulation is compressed under great pressure, makes it leak, crack and soot-proof, regardless of

compression or temperature conditions. The plug terminals are of non-corrosive platinnite, a composition which is said not to be affected by very high temperatures. The material for this purpose is imported from Sweden, the latter country already having attained a reputation as the producer of the finest materials for this purpose. The new Robert plug is made only in 1-2-inch iron pipe size.

**Buffalo Carbureter.**—That simplicity and fewness of small parts constitute the prime essentials of success is probably true to a greater extent of the carbureter than of any other part of the motor, and this has been fully recognized by the makers of the Buffalo carbureter. the Buffalo Carbureter Company, 889 Main street, Buffalo, N. Y. As will be seen from the accompanying sectional illustration of the Buffalo, it not only is composed of a minimum of parts, but also differs in other respects from cur-

cred. To enable the autoist to avoid this the Clysmic Spring Company, 251 Fifth avenue, New York, has prepared what is termed a "special automobile package," the convenient size and contents of which are illustrated by the accompany-

SPECIAL AUTO PACKAGE OF CLYSMIC.

ing cut. The latter consists of two quarts, two pints and five "splits" of sparkling Clysmic water, and one quart and two pints of natural Clysmic, thus providing a generous supply in a small compass. Doubtless the innovation will meet with general favor at the hands of those tourists who have not always found it possible to obtain a convenient supply of good water for drinking purposes along the road.

**Perfection Spring Winders.**—This is a new tool that has just been introduced to the automobile trade, and its value as an adjunct to the shop outfit of every repairer as well as to the tool kit of every autoist will be apparent at a glance, as it can be used with a lathe, drill or vise, and will wind compression or extension springs

PERFECTION WINDER.

of any length from any gauge of wire. To use, a spacing washer of the thickness desired is selected on the web and

moved opposite the handle. The end of the spring wire is then passed through a hole in the lug cast on the handle, as shown by the accompanying illustration of the complete tool. From here it is passed through the brass friction washers, at the same time passing through the hole in the stud on which the washers rotate. Then the end of the spring wire thus drawn through is fastened on the arbor, the spacing washer is rested against the arbor and the nut on the stud tightened to give the required tension, care being necessary to give the proper amount of tension as the wire passes through the friction washers, the makers stating that the wire should be dragged through the washers rather than pass through loosely. In winding, a slight pressure to the left produces a uniform spacing of the coils of the spring. A lefthand spring may be wound by reversing the operation described, starting from the opposite end of the arbor. The Remington Tool & Machine Company, Boston, Mass., is the manufacturer.

**Gleason Cushioned Bow Rest.**—The almost universal use of the cape top has brought with it a demand for some simple and effective device for the protection of the bows when the top is down, as the jolting of the car causes them to

GLEASON BOW REST IN SERVICE.

rattle and, if not restrained, to break and also damage the top itself. To prevent this the India Rubber Tire Company, 477 Wabash avenue, Chicago, Ill., have just placed on the market a device known as the Gleason Cushioned Bow Rest, which, in design, is extremely simple. It is made of a number of sections of pure rubber with a leather strap running through them, while a metal holder screws on to the bracket and holds it in place. It is adjustable and will fit any machine, the illustration showing one with four openings, but they are made with three and five openings also.

**Aluminum Solder.**—One of the greatest disadvantages inherent in aluminum has been the impossibility of soldering it by ordinary means, which accordingly greatly restricted its uses. Now, however, an aluminum solder is being placed on the market by the Aluminum Solder and Refining Company, of Oswego, N. Y. The invention dates back to about a year ago, and it is the claim of the makers that it will not only join aluminum to itself by soldering, but will also permit of its being joined to other metals, and as aluminum is an electrical conductor, this invention will open a broad field of usefulness to aluminum in the latter industry. They give an absolute guarantee with every bar of solder.

rent forms of construction. The float chamber with its cork float is placed at one side of the tubular mixing chamber, which is of unusual length, and the fuel enters at one side of the bottom, a drain cock being placed in the center. In fact, its construction may be taken in at a glance and scarcely calls for any extended description. That it has stood the test of time in no uncertain manner is evident from the number and standing of the manufacturers, who employ it as a part of the equipment of their cars. Some of these are the De Luxe Motor Car Company, Detroit, Mich., on their Queen cars; the Ford Motor Company, Detroit, Mich.; Jackson Motor Car Company; Knox Automobile Company; Wayne Automobile Company, Wayne Works, Richmond cars; Welch Motor Car Company; the H. E. Wilcox Motor Car Company, and others. Some of its notable performances are the winning of the 24-hour race at Detroit by the Ford Six and the showing of the Haynes stock car in last year's Vanderbilt race.

**Clysmic Water for Autoists.**—One of the great drawbacks of touring through sparsely settled country, or in fact any great distance from home in whatever direction, has been found in the indifferent and, at times, unpleasant character of the drinking water encount-

# THE AUTOMOBILE

LONDON, Aug. 20.—John Bull's land being a tight little island, it is easy for the police, municipal councils, county councils, village councils and every other body with judicial or assumed authority to take a maternal interest in the welfare of automobilists. On our pleasant, high-hedged dusty country lanes—from flowery Devonshire to grimy Lancashire—automobiles are generally a nuisance to everybody but the automobilist, and the special aversion of the conservative village squire and the one-man village police force. When speeders grew inconsiderate speed traps came into existence. Neighboring villages learned how Slocum - cum - Slocum was filling its coffers at the expense of the "beastly motor cars" and forthwith decided that it would have some recompense for the crops and gardens disfigured by the dust from our once deserted country lanes.

To-day police traps exist from John o' Groat's to Land's End, thickly scattered round every big city and thinning out in the rural districts where villages are four miles apart. Wherever you are touring there is the ever-present joy of knowing that hidden away retiringly in some thick hedge bottom or peeping out between the chinks of some north country graystone wall is a blue-coated constable with a Waterbury watch which has never been known to tell a willful lie.

But British motorists have got tired of paying five shillings and costs into town and village treasuries and have organized protective associations as complete in their working as the best organized constabularies. The Automobile Association first took up the matter by an active campaign for considerate driving on the part of its members and automobilists in general, and a lively fight against the principal police persecutors. In every district in which the association was represented voluntary and paid teams of scouts have been formed to denounce to fellow members the existence of traps. Technical journals naturally aid to their utmost in this work, publishing weekly a list of places in which the police are showing activity. One weekly magazine publishes a map of England showing about one hundred and fifty traps in operation from the South coast to the Scotch border. Week by week it is brought to date, indications being given

on the manner of operation and the time of greatest activity. Newly formed traps being the most dangerous, parties of scouts are kept on the roads to discover and report to passing automobilists where special caution must be observed. In addition to protecting inoffensive travelers likely to be the victim of over-zealous police officers, scouts are enjoined to keep an eye on unreasonable automobilists and either prevent or report all cases of abuse. In order that he may be known of automobilists and his advice accepted with confidence, the scout is provided with an association badge. Where this was not used individual autophobes have taken up the gratuitous work of sending automobilists full speed into known traps.

Scouts and police rarely show much brotherly love. Recently the latter have begun to play the game very low by copying the association badge and appearing in plain clothes. It is, however, a dangerous proceeding, for when discovered by the association, as it inevitably is, the arm of the law is severely dealt with.

Last week the Motor Union of Great Britain and Ireland went into the scout business, designed a badge and put a number of men on the roads most frequently used by automobilists. The scouts, who have been largely

recruited from the ranks of retired police sergeants and constables, are instructed to act with the police in warning drivers of dangerous places and advise automobilists where special caution is needed in driving through towns and villages. In addition they are to act as directing guides to the district in which they work, supplying all desired information on hotels, garages, etc. These model automobile policemen keep a close watch on their confrères of the regular force and do their best to frustrate any attempts to trap automobilists for speeding on short sections of open road. Information of this nature gathered by them is at once forwarded to headquarters and distributed through the usual channels.

Unfortunately, there is some jealousy between the two bodies, the A. A. accusing the M. U. of stealing its badge, and neither body showing any desire to be helpful to the members of the rival association. The unattached automobilist with neither of

A WORD OF CAUTION FROM THE MOTOR UNION SCOUT.

the club badges on his car receives the cold shoulder when he approaches the roadside scout with a winsome "My dear man, can . . ." and the member of the M. U. is sometimes told that there may be a hidden trap for A. A. members. To be perfectly protected when touring through England it is necessary to carry the two badges in some conspicuous position.

### HASTINGS WINS IN BRITISH AUTOCYCLE RUN.

In the open reliability trial organized by the Auto-Cycle Club of Great Britain, Theodore K. Hastings, the only American entrant, has obtained a clean score with an Indian motorcycle. A series of cablegrams received from the American competitor announces his progress in the British competition as follows: "August 12, arrived in London after pleasant voyage. August 19,

Hatfield; cordial reception by English motorcyclists; carbureter and machine adjusted to varying conditions of this country, runs like a charm. August 19, Coventry; rain, bad going, road greasy; qualified first day; arrested for speeding. August 20, Dangolten; qualified second day; rain, road greasy, tire trouble. August 21, Aberystwyth; qualified third day. August 22, Cardiff; qualified fourth day; tire trouble, roads excellent, fine running. August 23, Gloucester; qualified fifth day; more tire trouble. August 26, London; finished perfect score.

The Auto-Cycle Club's five-day reliability run was laid through rather difficult mountain country in Wales, the test being rendered more arduous by the heavy rain, which made going difficult at all times. Motorcycling has taken a stronger hold in England than in any other country, the competitions organized by the national club always being keenly contested.

## BROOKLANDS TRACK NOT AN ASSURED SUCCESS

LONDON, Aug. 17.—The Brooklands track has certainly not been altogether a success. The opening race meets were characterized by a lack of attention to details which caused great annoyance to competitors and spectators alike. In later events these mistakes have in great measure been remedied, but the improvement comes almost too late. The novelty of the idea has worn off and no longer will the public flock out to Weybridge merely to see a few runaway wins, with interminable intervals between events.

With the object of stirring up public interest once again, the club has decided to have but four classes in all open events in future. These divisions will be limited by the d'n over 2.5 formula, the powers in each case being as maximum 25 horsepower, 40 horsepower, 80 horsepower and 160 horsepower. Class III will include all engines built in accordance with the specification agreed to at the recent Automobile Congress at Ostend, while Class IV will hold any car that could manage to stay on the track at the corners. It has also been found advisable to shorten the races considerably and five miles will be the maximum distance for ordinary events.

Even with its defects, Brooklands has already served a useful purpose by showing up some weak points yet remaining in the modern automobile. The extraordinary number of breakdowns has been a feature of almost every race, and cars which might normally be considered beyond reproach developed all kinds of

ailments when forced along all out for a dozen miles. Water circulation troubles have been most prominent, closely followed by carbureter derangements. Rather an unforeseen source of trouble has been the fine cement dust from the track, which has played havoc with insufficiently cased-in joints and bearings, particular sufferers in this respect being cars on which the under screen had been discarded. All these points will, without doubt, be carefully noted and trouble obviated in future productions—showing the advantages and influence of the racing game in the evolution of the perfect automobile.

### Good Sport and Improved Management at Bank Holiday Meet.

Public interest revived considerably in the Bank Holiday meet. There being a shilling gate, society folk kept away, their absence, however, hardly being noticed in the 15,000 crowd from Greater London.

The race for the White steam car plate, in which only 30-horsepower White steamers, 1907 model, were eligible, provided excellent sport. There were eight entries, but Earl Russel's and Lord Blythwood's cars failing at the last moment, the starters were reduced to six. For the six miles F. Coleman's and Colonel J. Roper Wright's steamers raced bonnet and bonnet, the former finally making a sprint and winning by half a length. F. Payne's steamer got third position, nearly a mile behind, and the three others finished well bunched far in the rear.

WHITE STEAMERS, ENTERED BY PRIVATE USERS, HAD THEIR OWN RACE ON THE ENGLISH AUTODROME.

MOORE-BRABAZON LEADING WITH A BELGIAN MINERVA IN THE RACE FOR THE WALTON STAKES.

America was also represented in the Oatlands Selling Plate, which could hardly be called a race, for it united such diversified models as two 10-horsepower Cadillacs and 40-horsepower Napiers, very imperfectly equalized by a weight limit. Edge's 38-horsepower Napier came first, Charles Jarrott's Sizaire & Naudin second, a 10-horsepower Darracq third and the two Cadillac cars fourth and fifth, followed by a Napier and a Queen. The winning owner received \$750 and his car was sold at auction for \$1,075.

The race of the day was the running of the Prix de la France of 800 sovereigns for the entrant of the winner, and 200 sovereigns for the entrant of the second. Only machines which complied with the regulations of the French Grand Prix were eligible, their gasoline allowance for the 15¾ miles being proportionately the amount allotted for the race in France. D. Resta, driving a Mercedes, proved the winner, against a field consisting of three each of Mercedes, Napier and Dietrich, and one each of Motobloc and Darracq. When the gate went up J. E. Hutton's Mercedes took the lead, with Resta's Mercedes second, the others in order being Newton's Napier, Motobloc, Mercedes, Edge's Napier, and Dietrich. On the fifth round, after an exciting tussle, Hutton's Mercedes passed Resta's machine on the banking. Immediately afterward a series of mishaps occurred to Hutton, the car bonnet flew off, the accelerator pedal broke and a water pipe burst. This allowed Resta to get ahead again and finish first, but did not prevent Hutton securing second place on a deflated rear tire. Gabriel and Duray drove Dietrichs and Demogeot handled a Darracq.

J. C. Moore Brabazon, driving the Minerva with which he was victorious on the Ardennes circuit, captured the Walton stakes of 200 sovereigns, Huntley Walker's Darracq being second and two Minervas third and fourth.

In the contest for the Belgian plate, competitors for which had to comply with the regulations of the Ardennes circuit race, Napiers took first and second positions, Minerva third, Napier fourth, Moore-Brabazon's Minerva fifth, Huntley Walker's Darracq sixth and a Napier last.

A keen race was run for the International plate, for cars to be driven by subjects of the country of origin of the machine. S. F. Edge's Napier proved the winner, closely followed by Gabriel on a Dietrich. Tom Thornycroft's Thornycroft car was third.

#### Official Results of the Scottish Trials.

The recently published results of the Scottish Trials are of great interest on this side, in that out of nine cars qualifying for first awards all but two are British, the exceptions being two Mass cars from France. To the American reader, in whose mind "all-

British" does not arouse feelings of noble pride, the points of interest in this Scottish Trial are the general absence of tire trouble and the big fuel economy of the competing cars. The tire makers must indeed be given big credit for the advances they have made.

When a hundred cars can cover a 750-mile course over every class of road, and in no single case have tire stoppages totalling to one hour, one trouble of motoring is clearly on the wane. This satisfactory demonstration is the more conclusive by the backing it has had in other European automobile competitions.

Hardly less remarkable is the low fuel consumption, which was throughout carefully checked by the observers. First place in this line is given to the 24-30-horsepower Arrol Johnston, credited with 41.4 ton miles per gallon of gasoline and 24 car miles per gallon. Next in merit comes the 16-horsepower Albion, with 37.6 ton miles and 23.6 car miles for each gallon. To take a few other notable examples, the 50-horsepower Rolls-Royce did well with 32 ton miles and 17 car miles per gallon, while with the same quantity of fuel the 40-horsepower Berliet and the 35-horsepower Iris could each cover 22 miles of road. The biggest distance per gallon, irrespective of weight, was made by the 10-horsepower Chambers in Class I, which touched 37. miles.

#### Over 14,000 Miles for the Rolls-Royce Non-Stopper.

The longest officially observed reliability trial has just ended with the conclusion of the 15,000th mile of the 50-horsepower six-cylinder Rolls-Royce, and only then because the R. A. C. decided that the official observers had had quite enough fresh air for the present season. This big run was commenced at the Scottish Trial, but hardly had the car started on the second day's journey when the gasoline tap closed itself and the car came to a standstill—though nobody but an official observer would mark down the twenty seconds taken to get going again as a stoppage for mechanical trouble. From this time onward the car behaved in an exemplary manner, and for six weeks four sets of drivers and observers ran the car from London to Glasgow and back, 400 miles being traversed every twenty-four hours, with stop for Sundays only. To the end of the 15,000 miles no further stoppage occurred, so that the world's observed non-stop record stands at 14,371 miles to the credit of the Rolls-Royce. Such a performance speaks for itself and hardly needs any further comment. Certain it is that this record is not likely to be in danger of being increased for some time to come. Examination of all the running parts of the car is being made at present by the club's technical committee and when any necessary renewals have been effected the entire running costs of the run will be published.

## TO TRAVEL 62 MILES AN HOUR ON WATER.

PARIS, Aug. 20.—Surrounded by half a dozen mechanics in his private workshop, at Neuilly, Santos-Dumont is actively at work, while all good Parisians are idling at the sea shore or in the mountains. A \$10,000 bet depends on the activity of the next few months, and the young Brazilian aeronaut is not the man to be beaten easily. At a recent dinner, held to celebrate a bet between M. Archdeacon and M. Charron relative to a hydroplane performance, Santos-Dumont formed one of the party, and was led to take up a wager with the head of the C. G. V. automobile firm that he would travel over the water within eight months at a speed of 100 kilometers (62 miles) an hour.

"Up to the present those who have given attention to hydroplanes," declared Santos-Dumont, "have made the mistake of constructing machines far too heavy. To obtain high speed on water, as well as on land, weight is of primary importance. The apparatus I am now building consists of this aluminum and wood carcass, 32 feet long, cigar-shaped, to be covered by a rubber envelope and filled with compressed air. At the forward end it will rest on the water by means of a transverse float 13 feet in length, and by a smaller float at the rear—about 5 feet in length.

"My motor will be a 16-cylinder Antoinette, developing 120 horsepower. It will be placed at the forward end of the hydroplane just above the larger float, and will weigh, all accessories included, not more than 330 pounds. The total weight of the hydroplane will be 550 pounds. No, it is impossible to say when the hydroplane will be ready for its first test, but I am sure of traveling 100 kilometers in the hour before January 1."

## PIERCE CO. OPENS TOURIST OFFICE IN PARIS.

PARIS, Aug. 19.—A remarkable increase in the number of American automobiles touring in France has been noticeable during the past two seasons. In 1905 an American family touring Europe in an American machine was a distinct novelty. In 1906 scores of the best known makes of cars from across the Atlantic could be found in the principal Parisian garages and in the large provincial touring centers. This year the number has further increased. As a convenience to their numerous clients who now tour Europe in Pierce machines, the George N. Pierce Company has found it necessary to open offices in Paris, where spare parts can be obtained and where tourists may find all information on European travel. N. Smith Goodsill, for many years an American resident in Paris, has charge of the establishment. During the present season no fewer than forty Pierce machines have reported at the French headquarters. Other American automobiles frequently seen touring in France are Packard, Lozier, Rainier, Stearns, White, Winton and Oldsmobile.

## 3,071 EUROPEAN MILES WITH ONE SET OF TIRES.

H. M. Sternbergh, president of the Acme Motor Car Company, is now touring Europe, and in a letter he writes:

"The other day in our Acme we ran to Bern, on to Morat, near Neufchatel, and returned, making seventy-one miles in less than four hours, over fine roads and through charming country, without a hitch or drawback of any kind. This is pretty good, considering that we had to slow down frequently for sharp curves in the road and in passing all sorts of vehicles, such as two and four-horse wagons, two-cow wagons, one-horse and one-cow wagons, dog and man carts, baby carriages, and men, women, children and dogs afoot. We came all the way in the car through Holland from Rotterdam, along the Rhine, over the Taunus Mountains, where we encountered snow banks in the road, and up and down steep hills. We then came through Wiesbaden, Darmstadt, Stuttgart, and Heidelberg, through the Black Forest to Freiburg, Schaufhausen, Zurich and Lucerne to the delightfully quaint and interesting little Swiss town of Thun, making all told 3,071 miles, with but one set of tires."

R. G. KELSEY IN HIS NEW 50-HORSEPOWER HAYNES.

## SOME NEWS FROM GERMANY.

BERLIN, Aug. 17.—The German Motor Volunteer Corps is sending a great number of cars to the Imperial maneuvers early in September, and although the most important work will be put into the corps' hands, the military authorities have had to hire several other cars outside the corps in order to meet all requests for automobiles made by the various departments and staffs. The importance of the automobile in modern warfare is thoroughly recognized in the Fatherland.

The South-German tour for this season has met with the same fate as the West-German event—postponed until next season—and the promoters of both contests have only to thank the fierce opposition of the South-German press for these lamentable endings to labor extending over a period of several months. The South-German tour, although national, would well have vied with the last Herkomer as far as importance for Germany event, as it had a large number of entries, close on 150, and magnificent prizes had been donated. After Wurtemberg and Baden had refused permission for the tour to traverse their territories, the committee came to the conclusion that it would be unwise to work out a new and wider route for Prussia. Hesse and Bavaria, as the Prussian Government, while giving the last West-German tour full permission, at the same time nullified this by a most handicapping set of regulations, turning the event into a procession with no passing of any kind, and a like result was also feared for here.

An interesting English-German suit will be heard after the law vacations in England, as the German Daimler Motor Company has taken steps in the London High Court of Justice to prevent the newly founded British and Colonial Daimler-Mercedes syndicate from using the words Daimler-Mercedes.

THE NEW WATER-COOLED CORBIN APPEARS IN PUBLIC.

## PEKIN TO PARIS BY AUTOMOBILE IN 62 DAYS

PARIS, Aug. 16.—Drizzling rain damped the boulevards, but was incapable of lowering the enthusiasm of Parisians on the arrival of Prince Borghese and his Itala car home from the 8,000-mile run from Pekin. Boulevard Poissonnière again brought out its fourteenth of July flags and decorations; *Le Matin* establishment reveled in tricolor flags outside and within had transformed its business offices into a banqueting hall, where champagne flowed and where eatables were distributed in gratuitous profusion.

On the heights of Champigny crowds of automobilists, cyclists and foot passengers had congregated to escort the procession of Itala cars, with the prince at its head, into the city.

Borghese, however, evidently decided at the outset to push ahead of his companions, for he arranged for his own supplies in China through his brother, a chargé d'affaires at Pekin, and had his own gasoline stations established in Russia and Siberia through influential friends in those countries. It was an easy task to outstrip his companions, for the Itala car has a 40-horsepower engine and a runabout body, whereas the other machines are not over 20-horsepower and carry a fully equipped tonneau. The Contal tricar had but a modest 10-horsepower engine to propel it over untraveled regions.

When Prince Borghese decided to undertake the journey his request for a machine was at first refused by the Itala Com-

HOME FROM CHINA—TRIUMPHAL PROCESSION OF ITALA ON JOINVILLE BRIDGE, EIGHT MILES FROM FINISH.]

Over the Marne at Joinville, the last river to be crossed, through the Bois de Vincennes, the populous district of the Throne and down to the Grands Boulevards, where a detachment of Republican Guards gave official dignity to the travelers, the procession increased in volume and importance. Cyclists held on to the sides of the victorious car, glorying in the opportunity to risk life and limb—for the Parisian cyclist considers himself the half brother of the automobilist; occupants of cars worked themselves into a frenzy, and the idle boulevardier cheered as he felt in honor bound at anything pertaining to the automobile industry which the patrie created.

Sixty-two days ago—on June 10—Prince Borghese's Itala, together with two De Dions, a Spyker car and a Contal tricar, left Pekin for Paris in response to a challenge issued by the Parisian journal *Le Matin*. It was agreed that the five contestants should keep together until Lake Baikal was passed and be helpful to one another, the contest being undertaken to prove the ability of an automobile to cross two continents under its own power, irrespective of speed. A route was planned out by the *Matin* and a number of gasoline stations fixed at intervals. Prince

Finally they acceded to his request by furnishing a 1907 model 40-horsepower car, set on specially high wheels and with its under body cleared as much as possible to provide against damage from the rough country to be traversed. Two bucket seats were fitted in front and a single seat placed in the center of the rear platform, flanked on each side by a large gasoline tanks capable of containing sixty gallons, calculated to be sufficient for 625 miles. Across the rear of the platform was a box in which tools and spare parts were carried, and the remaining space was used for two tanks, one to hold twenty gallons of lubricating oil, the other for water, which it was expected might be needed in the desert. Pirelli & Co., of Milan, supplied the tires to special order, sending large quantities to various stations along the route. It was found, however, that very few tires were needed, the total consumption being sixteen shoes and the same number of inner tubes. In place of mud-guards four stout wooden planks, one inch thick and five feet in length, were used, two being fixed obliquely at each side of the car to a footstep near the middle of the frame. When an obstacle was met with these were taken off and used as a

bridge. The entire car was of Italian construction, with the exception of the low-tension magneto, supplied by the Simms-Bosch firm of Paris.

**Chinese Country Proved Most Difficult of the Tour.**

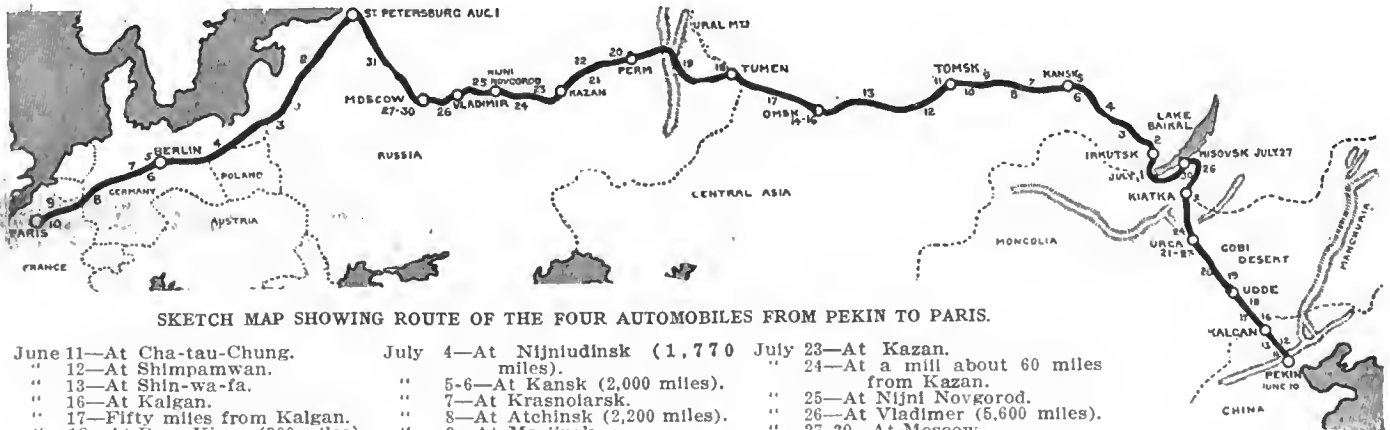

On the third day out from Pekin the Itala was imbedded over the axles in a morass held up by immense roots of trees which had to be cut away with axes before the car could be liberated. Two days later another morass detained them for an hour, and when this was overcome the car had to be dragged through eighteen miles of deep sand by coolies and mules. The first part of the journey from Pekin to Kalgan was practically the only one where outside aid had to be obtained. Animals were used at first, but it was soon found that natives were better, owing to their greater quickness in obeying commands. Over this stretch of country the special mud-guards were found invaluable when used under the wheels.

At Pong-Kiong the newspaper correspondent accompanying the prince sent the first message, the only one which had been dispatched within a radius of 100 miles within six years. At this point Pons, driving a Contal tricar, abandoned the contest: The Itala had, got a big lead, the De Dions and the Spyker

had been thrown away to reduce weight on entering the desert; consequently little aid could be given by the engine when the bog was struck. Mongols, armed with long beams which they used as levers, and a big team of oxen finally extricated the car. The automobile was in an even worse position the next day, when, in order to get it out of the morass, the body had to be removed and four hours hard tugging indulged in. After the mud-guards had been cast off the water tank was abandoned, nothing being carried on the car but the crew's personal effects, tools and four spare tires. When rivers had to be forded the magneto was always removed, for it could never be ascertained accurately beforehand to what height the water would rise. On three occasions every article was removed from the machine and oxen dragged it through the water, which once completely covered the car, but without causing any damage. The task occupied three hours.

**Daily Attention to Engine Was Well Rewarded.**

Much of the credit for the safe arrival of the Itala, says Prince Borghese, is due to the painstaking work of the mechanic. During the day he occupied a little nest on the rear platform with a gasoline tank on each side and a tool box behind him.

**DAILY PROGRESS OF THE CONTESTANTS.**

Figures on map mark daily progress of the Itala on its 8,000-mile journey from Pekin to Paris. Map is reproduced from English "Motor."

were traveling together with the Contal slightly in the rear. Owing to some repair the little tricar was left behind by its larger companions, but pluckily held on its way until the emptying of its gasoline tank brought it to a final stop. According to the French driver, no attempt was made to help him, although the worst stage of the journey had been covered and he was in a position to continue, and he was consequently obliged to work back to Pekin on foot, disappointed and disgusted, then proceed to Paris by train.

The most fearful part of the journey was across the Gobi desert, a distance of about 1,000 miles, as nearly as could be ascertained. Frequently the heat in the desert reached 122 degrees F., parching the throats of the travelers and making breathing most oppressive. No road existed, not even a track was visible, the telegraph posts alone indicating the direction of travel. No help could be had from a compass, for the Itala did not carry one.

The 60-gallon gasoline tanks proved specially valuable on this stage of the journey, allowing the Italian car to continue uninterrupted, while the Spyker was held up awaiting supplies and the Contal was abandoned. But Prince Borghese had his own troubles. At Ourga the Itala stuck in a morass and fell over on its side. To the deep regret of the team the mud-guards

When the night stage was reached he made a thorough inspection of the engine, often working long after the others were asleep, laboring so conscientiously that the car was never delayed by mechanical troubles.

On June 30 a bridge broke down, precipitating the car and its occupants into a torrent from which they escaped with difficulty. The car suffered much damage and was only salvaged after three hours work. For a large portion of the journey the railroad tracks ran parallel with the road. An attempt was made to run the car on the track, one wheel being between the rails, the other on the outside. It was never known when a train would be met, for drivers would run ten or twelve hours late without any compunction. After a very close escape from a collision, owing to the outside wheels sticking in the sand, it was decided that this was not a very safe method of travel and the boggy track was again followed.

Before reaching Omsk, in Central Asia, the seizing of the brake bands caused overheating and set the car on fire. Axes had to be used before the flames could be extinguished. Just when the Ural mountains had been crossed and European ground was entered upon, the left back wheel spokes became loose. They were soaked in water all night, but this was not sufficient to prevent the wheel collapsing the next day. A local workman,

who had never before seen an artillery wheel, rigged up a makeshift, which gave indifferent service until a substitute could be sent out. The second rear wheel was changed as a precaution. At Moscow both rear springs broke, and one front one having become weak was changed to prevent future delay.

From Moscow an unending series of fetes awaited the leader of the Pekin-Paris tour. The Automobile Club of Russia organized a procession of automobiles, among which was an American Buick, a large English omnibus and a number of French cars to go out to meet the Itala, a Cossack guard escorting the party in triumph into St. Petersburg.

#### Belgium Provided the Skeptical Police Officer.

After forty-one days' traveling through the land of the Czars, the German frontier was crossed at Wierzbolor and Berlin was reached on August 5. An enthusiastic reception was given by the Imperial Club, but the travelers were too anxious to reach their destination to stay longer than two days, and on the 6th made their departure accompanied by half a dozen Italas. Except for a stoppage in Belgium by a gendarme, who refused to believe that the prince was other than a smuggler or at best a law-breaking automobilist, no incidents marked the remainder of the journey until the Parisian wave of enthusiasm broke out.

When the car had been stripped of its mud it was found that it had lost about 250 pounds in its 8,000-mile journey, all unnecessary articles having been shed en route. For a few days the Itala occupied a position of honor in the windows of the *Matin* offices; it has now taken to the road again with Milan as its destination, where illuminations and banquets will be the lot of the modest travelers once more.

The exact mileage from Pekin to Paris is not yet known, the Itala car not carrying a distance recorder, owing to the owner's desire to save weight; it is calculated, however, to be between seven and eight thousand miles. Sixty-two days were occupied in making the journey, 12 of which were spent in different towns making adjustments, waiting for stores or being entertained by the enthusiastic populations. Prince Borghese believes that the trip could have been accomplished in 55 days and that 45 days might be sufficient to make the journey from Pekin to Paris at the right time of the year.

A cable from Cormier, the head of the De Dion team, announces that he is at Moscow together with the Spyker. Enthusiastic crowds gather round the three cars, examining them in detail and admiring them without stint. They are eighteen days behind the Itala and in order to gain time have decided to refuse invitations, avoid St. Petersburg, and make for Berlin.

## 1908 GRAND PRIX DATE AND CONDITIONS ANNOUNCED

PARIS, Aug. 20.—Hardly have the echoes of the 1907 Grand Prix died away than announcement is made of the great French race for next year. According to an official notice, just issued by Secretary Sautin, the 1908 Grand Prix will be run between June 20 and July 5, the exact date to be decided later. Regulations adopted are those decided upon at the Ostend conference, and are officially condensed into three brief paragraphs:

"All cars taking part in the 1908 Grand Prix must have a four-cylinder motor with a bore of 155 millimeters (6.1 inches), or this equivalent when any other number of cylinders are used.

The cars in running order, but without water, gasoline, tools, spare parts or extra tires, must weigh a minimum of 1,100 kilos (2,425 pounds).

"In this weight of 2,425 pounds, oil in the motor and gear-case will be included."

No official announcement has been made regarding the circuit, but, as most of the members of the Sporting Commission are in favor of the Dieppe circuit again and Dieppe naturally has no objections to make, it is exceedingly probable that the 1908 Grand Prix will be held over the same ground as the race of this year.

The proposal is afloat to retain the Dieppe circuit as a permanent course, on which not only the Grand Prix, but all other events of the A. C. F. would be contested. Such a move has become necessary owing to the expense of organizing a military-guarded race on a fresh course each year. Excepting the last event, every international race in France has entailed a heavy loss on the French club. With a fixed circuit this loss would be changed to a substantial profit. If the Dieppe circuit is decided upon as a permanent course, it will probably be reduced in length by cutting out Eu and running the road direct from Londinières to Criel.

A lively technical discussion has been raised on what shall be the equivalent dimensions for engines having other than four cylinders. Certainly four-cylinder four-cycle motors will predominate in the race, but it is felt that an early decision should be arrived at on regulations governing the possible entry of six and eight-cylinder machines and two-cycle motors. Constructors intending to depart from the beaten track must wait until the next meeting of the conference, in December, for a final decision, while those who will adhere to the regulation type of racer can commence building at once.

## MILITARY FOR ALL FRENCH TOURING TESTS

PARIS, Aug. 19.—No further contests in which any fixed speed has to be maintained will be allowed over unguarded roads in France, according to a declaration made by M. Hennequin, general secretary of road traffic at the Ministry of the Interior. As the result of the deplorable accident in the Criterium of France touring competition, stopped by order of the Government, an order has been issued that the Rochet Schneider Cup, intended to be held under similar conditions, will not be authorized. This competition has been held for three years without accident, but the Minister declares that it is impossible to allow it to be held again after what has happened in the A. C. F. competition.

Interviewed on the probable attitude of the Government regarding future competitions, M. Hennequin, who is a strong supporter of automobiling, declares that no definite decision has yet been taken, but it is probable, owing to abuses which have developed in recent competitions, that no more events will be allowed on a time schedule. In the Criterium of France, organ-

ized with the consent of the Government on a schedule calling for twenty-four miles an hour—the legal speed is only eighteen—many competitors ran at an average of fifty miles an hour over the most thickly populated stages. Their speed during the tour was only slightly inferior to that of the race on a guarded and tarred circuit.

"In future," said the Minister, "we shall only authorize contests on closed circuits, well guarded by troops, and perfectly tarred or oiled. Events such as the Criterium of France will, I hope, never again be seen in this country."

As the result of this decision the question of a permanent autodrome has been brought forward more prominently than ever. French constructors are not adverse to such a scheme provided the circuit is not less than twenty-five miles round and follows the natural outline of the country, without any special banking. A speed course in the nature of that at Brooklands in England is strongly opposed.

AIR-COOLED FRANKLIN, CHICAGO-NEW YORK RECORD BREAKER.

### FRANKLIN LOWERS CHICAGO-NEW YORK MARK.

From 56 hours 58 minutes the Chicago-New York time established last year by a six-cylinder Franklin, the 1,240-mile journey has been reduced to 39 hours 53 minutes by a Model D 28-horsepower 1908 Franklin car driven by a team of four men. The start was made from Chicago at 3 A.M., August 21; South Bend was touched at 6:40 A.M., and at 9:20 P.M. the Franklin was in Erie. Between Buffalo and Syracuse the exhaustion of the gasoline supply caused some delay, but when Weehawken, across from New York, was reached, at 7:53 in the evening, seventeen hours had been cut from all previous records. James Daly, Melvin Bates, Charles Talbot and Clayton Carris alternated at the wheel of the Franklin. Only one puncture occurred on the journey, but as Diamond quick detachable tires were used this caused but a momentary delay.

The average mileage for the run is about 30. The exact number of miles traveled is not known, the speedometer breaking off owing to the rapid going over exceedingly rough roads.

### RENAULT POSTPONES CHICAGO-NEW YORK RUN.

Owing to the breaking loose of the gasoline tank, the Renault attempt to lower the Chicago-New York record has been postponed until next week. At 3 A. M. last Saturday Paul Lacroix and Bernin started from Chicago on a 35-45-horsepower Renault, with runabout body, reaching Toledo, Ohio, at 1 P.M. Owing to the rough going the gasoline tank broke loose. It was repaired, but breaking loose again and some little trouble developing with the oiler, the run was temporarily abandoned at Cleveland. M. Bernin, who had handled the car on the outward trip, took it back to Chicago at a more moderate pace and arranged for a stronger tank.

It is claimed by the Renault people that at Toledo they were three hours ahead of the Franklin record, the car then running excellently and capable of continuing but for the tank mishap.

RENAULT TRIO HAVING DESIGNS ON CHICAGO-NEW YORK RECORD.

### GEORGIA FARMERS OBJECT TO RESTRICTION.

ROME, GA., August 19.—A recent story sent from here to the *Atlanta Constitution* was as follows:

The Farmers' Union of Floyd county has gone on record as opposed to any drastic legislation prohibiting automobiles from traveling on the public highways of the State. As a reason for opposing any severely restrictive measure, the Floyd county union holds that no factor has been or will be so important in the development of good roads as automobiles. The Union realizes that any bill that will prevent automobiles from running on the public highways of the State—and they hold that measures now pending in the Georgia legislature will have that effect practically—will seriously retard the good-roads movement in the State. It is understood that this is the general sentiment of the union all over the State, and the action of the Floyd county union will probably be followed by a similar stand by all of the county organizations.

### SIX PERFECT SCORES IN OHIO ENDURANCE RUN

COLUMBUS, O., Aug. 26.—Six automobiles finished with perfect scores in the two-day endurance run for the Ohio Sun trophy. They were Pope-Hartford, Buick (2), Thomas, Premier and Oldsmobile. Twenty-three cars started from Columbus, the number of persons in the tour being about ninety. One of the two Logans which entered in the runabout class came short of a clean score by the narrow margin of four points.

HARLAN W. WHIPPLE, EX-PRES. A. A. A., IN HIS 60-H.P. MATHESON.

### INDEPENDENTS NOW NUMBER 46 MAKERS.

A grand total of forty-six is now the membership of the American Motor Car Manufacturers' Association, which makes it numerically the largest trade organization of its kind in the world. The forty-sixth member is the Pennsylvania Auto-Motor Company, of Bryn Mawr, Pa., makers of the Pennsylvania car, recently elected. The American Association members this year will have about 26,000 square feet of space in the Grand Central Palace Automobile Show, to be held in New York, October 24-31. This is an increase of 50 per cent. over the space which was last year assigned to the association. The drawing for spaces and the allotments will be made at the New York headquarters, 29-31 West Forty-second street, Saturday, August 31.

### DRAWINGS FOR POSITION IN PALACE SHOW.

Drawing for space in the Grand Central Palace show, to be held from October 24 to 31, will take place at the A. C. A. clubhouse, West Fifty-fourth street, New York City, on Wednesday, September 4, at 10:30 A. M. This drawing is independent of the one on August 31, for members of the A. M. C. M. A. only.

# CONSTRUCTION OF MOTOR VEHICLE SPRINGS

By J. G. RUMNEY.

THE laws which govern the construction of springs, to obtain the best results, not only in durability, but in other respects also, have been long known, but are very seldom made use of in the proper way, even by persons who are familiar with the formulas commonly used.

Many manufacturers furnish and guarantee the life of springs which are constructed not upon well-prepared specifications, based upon the properties of the steel and upon a full knowledge of the service in which the springs are to be used, but upon the crudest data imaginable, and without the least inquiry as to the service; and many specifications are received by manufacturers defining conditions which cannot be complied with. The results are increase in cost of production and failure in service.

When springs of this kind break the makers are held responsible and a replacement is requested, and unless they succeed in proving rough usage it is generally complied with; whereas, if conditions or actual requirements were thoroughly understood, the cause of the trouble would be removed and the manufacturers would not be blamed.

The cause of all trouble with springs, aside from poor material and workmanship, is found in an excessive deflection; *i. e.*, a deflection which produces stresses in the material beyond its endurance.

The deflection of a given size of steel is limited to an amount corresponding to the strain the material is able to endure without rupture, and consequently if this is exceeded failures will result. When, therefore, the deflection is forgotten or not considered in the calculations, springs are generally produced which prove anything but serviceable and must be frequently renewed, at great cost and inconvenience.

The deflection is therefore the paramount issue in the construction of springs. There are, however, three kinds of deflection, which may be termed: desirable deflection, permissible deflection, and possible deflection.

The desirable deflection is the amount a spring should be able to deflect in order to avoid shocks and produce good riding over a rough road, and must be provided for in the construction of motor cars so that a sufficient amount of material of proper dimensions may be used.

The permissible deflection is the amount a spring may be deflected repeatedly without breaking or without changes in its original shape.

The ability of a spring to deflect within safe limits depends entirely upon the proportions of the plates, which will be explained further on.

The possible deflection is the total distance a spring may have the opportunity to deflect if allowed to do so, and which is generally not provided for in the construction of springs.

In full elliptical springs the possible deflection is the distance between the centers when free. The distance can be so proportioned to the dimensions of plates that when the centers meet the material has not been overstrained.

In half or semi-elliptical springs the distance may be much greater than the permissible deflection, and if the springs are permitted to deflect the entire distance they are apt to break or take a permanent set, either of which is equally objectionable.

Constructions should, therefore, be made so that the possible deflection does not exceed the permissible deflection, and if this is impracticable in the ordinary construction of frames, etc., some means should be introduced to accomplish same results.

The object of this paper is, therefore, to call attention to the methods which should be followed in the calculations of elliptical and semi-elliptical springs so as to guard against an excessive

deflection, which is the principal cause of broken springs, and thus bring about a better understanding between the makers and users of such springs.

To make the subject clear to those who may not be perfectly familiar with the laws governing strains in materials, some elementary explanations will be used, which it is hoped will be excused by those to whom they may be unnecessary.

It is well known that if a piece of steel or other material in the shape of a bar is supported upon its two ends and a load is applied in the middle of the bar, the material will be subjected to strains, and if the load is great enough the strains will go beyond the endurance of the material and the piece will break or its original shape will be changed.

It is also well known that all material will deflect more or less when supporting a load in this or similar ways; and, further, that the amount a given piece will deflect depends entirely upon the magnitude of the load or its momentum, and that, therefore, the greater the load the greater is the deflection. It is equally as well known, but generally lost sight of, especially in spring construction, that the strain in the material increases directly as the load, and, consequently, as the deflection. Therefore, the strain in the material is twice as great if deflected two inches as it is if deflected one inch only, and three times as great if deflected three inches; from which may be seen that if there is no limit to the deflection the material will be overstrained, from which it naturally follows that, while springs are made use of for the purpose of obtaining deflection and to gradually check and bring to rest a suddenly applied force, it is evident that the deflection must be limited within certain boundaries.

The extent to which a given spring may be deflected (the permissible deflection) depends upon several things, among which may be mentioned:

First.—The nature of the material.

Second.—The length and proportionate arch.

Third.—The width and thickness of the plates.

Of these the first mentioned is perhaps the most important, for without proper material the most careful calculations will not produce the desired results. The importance of the other two items is found by calculations based on formula and experience.

These formulas show that the deflection is governed entirely by the length and thickness of the plates, and that the relative proportions between these two dimensions cannot be changed without a change in the deflection.

A plate of a fixed length and thickness, or a spring of fixed length and thickness, no matter how wide the plate may be or how many plates the spring may be composed of, has a well-defined (permissible) deflection, which cannot be exceeded without straining the material.

The relations between the deflection, thickness and length of plates must, therefore, be maintained within figures corresponding to the strength of the material, in order that the best results may be obtained. These relations are often overlooked in the construction of springs.

Springs are used on account of their ability to absorb through sudden deflection increases of loads and to regain their original shape when the excess load has been removed, thus avoiding violent shocks. The greater the distance through which a spring can deflect the longer is the time in which the load is fully applied, and consequently the less severe is the shock. The more sensitive they are to any variation in the load the easier the vehicle will ride. The nearer the spring is loaded to the elastic limit of the material, the slower, longer, easier and more uniform are the vibrations.

This statement may not be understood, but may be verified in a simple manner by placing a piece of wood or other material on

\*Paper read before the Society of Automobile Engineers at Buffalo, July 30-31, 1907.

two supports and load it in the middle with a suitable weight. If the relation of the weight to the material and section of the piece is such that the stress in the material will be comparatively low, the action of the piece, if set in motion, will be in the nature of a number of small, very quick vibrations, as shown in Fig. 1.

FIG. 1.—Showing quick vibratory action under light load.

The full line is intended to represent the position at rest, and the dotted lines the number and magnitude of the vibrations. If the load is increased so as to approach nearer to the elastic limit the vibrations will be as shown in Fig. 2—a few long, slow movements.

FIG. 2.—Showing slow vibratory movement under increased load.

There can hardly be any question as to which one of the two methods should be followed in order to produce smooth riding.

When deciding, however, as to how near the stress under the static load may approach the elastic limit, it must be borne in mind that if it is too near the limit very little additional deflection can be obtained before the elastic limit is reached and the usefulness of the spring is destroyed.

Practical tests have demonstrated, however, that a strain under a static load of 60 per cent. of the ultimate resistance of the material is permissible and will leave sufficient margin, in the majority of the cases, for the absorption of ordinary shocks.

We have tried to discover the reason why springs did break, and, looking into the matter in various ways, we came to the conclusion that there were, as it may be called, no safety-valves placed upon the springs—that is, at least upon the semi-elliptical springs. The full-elliptical springs have a safety-valve, and if properly designed the springs cannot be overstrained for when the centers meet the strain is at its limit; but with the semi-elliptical springs the situation is different—there is nothing to prevent the springs being deflected beyond their elastic limit.

The method of calculating springs has been laid down by Reulcaux in his formulæ, and if they are properly understood there is no reason at all why manufacturers should not make proper springs. But the formulæ are not understood, and as a last resort manufacturers generally specify the weights that the springs are to carry and leave the rest to the manufacturers, and allow them to design any spring that is suitable to carry the static load and which they think they can guarantee. Many manufacturers do not look into the conditions under which the springs have to work; they look on the load and the material, not on the deflection at all, and springs are placed in service in positions where they are not suitable.

It is quite easy to take all these things into consideration, and this paper was written for that purpose—to point out what should be considered in calculations of springs, and the main point, aside from proper material, is to pay due regard to the deflection. The breakage of a spring is due to an excess of deflection; that is to say, if the road is rough, and with fast speeds, the result is that either springs take a permanent set or the plates will break. The deflection is determined entirely by the length of the springs and the thickness of the material. Any spring that is properly designed should last until the material has become fatigued through constant use.

The question as to what should be a proper deflection for springs has been argued in many ways, but I think it will be agreed that the greater the deflection can be made the better the vehicle will ride, and after it has been determined what the deflection should be, the remaining requirements may be readily calculated.

The riding of the vehicle depends largely upon how high the strain in the material is allowed to be under the static load. The nearer the strain comes to the elastic limit the easier the springs will act; the farther away from the elastic limit, the rougher will be the riding.

The best spring-makers, using the very best steel, cannot make a satisfactory spring unless the deflection is limited within the bounds of the elastic limit of the material. Next to the steel, or perhaps more than the steel, the construction of the spring is, in most cases, of the most importance. Also of prime importance are a properly standardized uniform heat treatment, special composition, high tensile strength steel, and intelligent design, associated with modern refined heat treatment. These are necessary to produce springs such as are required by automobile manufacturers, who desire to maintain a good reputation.

I fear, gentlemen, that I have imposed upon you too long. I have endeavored to be brief, and have confined myself to one phase of spring manufacture, and I trust a phase which will be of some interest to you. Also, I would disclaim full credit for this paper, because, owing to illness and absence from home, I have been unable to give the matter proper attention, so have been compelled to use some extracts from papers of others, my chief authority being C. A. Lindstrum, M.E.

## FAILING DUSTLESS ROADS, MAKE DUSTLESS CARS

Automobilists—and with them we are to a certain extent in agreement—urge that the roads should be constructed to suit the modern traffic conditions, says *The Engineer*. But we go further, and add that if manufacturers can produce cars which raise very little dust, then every encouragement should be offered for them to do so. From information which we have gleaned from a reliable source, we gather that the amount of dust raised was proportional to the speed up to forty miles per hour, at which the cars ran—and yet motorists urge the abolition of the speed limit! It cannot be said that the speed limit has been of any real use at all, but unless cars can be made to raise less dust—for it is obviously impracticable to reconstruct all the roads in the course of the next two or three years, even if the money were forthcoming to do it—there can be no hope of an abolition of this limit. For the good of the general public, those designs which are known to be prolific dust-raisers should not be allowed on the roads. We do not in any way wish to handicap so new and important an industry, but it must not be forgotten that it is in the best interests of motoring itself that the dust nuisance should be abated.

## METHOD OF LIQUEFYING RUBBER.

To dissolve india-rubber, says *Work*, take one part of the raw or unvulcanized material, and cut it into thin shreds with a sharp knife wetted with water; dry the rubber, place it in a wide-mouth bottle, and cover with benzene; shake the bottle occasionally, and add more benzene from time to time, as the rubber swells, until a thick fluid product is obtained. The rubber used must be of the raw kind, not that which has been made up for sale; the latter has been vulcanized by heating with sulphur, and is quite insoluble in benzene. Moreover, there is very little rubber in ink and pencil erasers, as they are composed very largely of mineral matter. It is also important that the right solvent is obtained; benzene is the coal-tar naphtha or benzol. Petroleum ether or spirit, also known as benzine and benzoline, will not dissolve india-rubber. On evaporation of the solution of india-rubber in benzol, the latter passes off in the state of vapor, leaving the india-rubber quite unaltered.

# DOES ALCOHOL ATTACK METALLIC SURFACES?\*

By G. LESSARD.

NOW that it seems certain that alcohol is destined to ultimately form the world's motor fuel, it is apropos to consider whether this carburent is afflicted with an inherent vice that would render its use prohibitive for this purpose. It has been asserted that the most grave objection to the employment of alcohol as a fuel is its oxidizing action on metals, and it is said that tanks, cylinders, valves, piston-rings and mufflers are all damaged by the use of alcohol. We will examine these accusations at length, with a view to determining if they be justified, as well as the remedies to be adopted to counteract this noxious action attributed to the use of alcohol.

Chemical researches have long since demonstrated beyond the shadow of a doubt, that *pure* ethyl alcohol has no deleterious effects on any of the metals used in the automobile industry, with the exception of one, that of aluminum, to which alcohol gives up its oxygen, to form alumina, consisting of two parts of aluminum and three of oxygen, and which is the oxide of the metal. Consequently, it will suffice to avoid the use of aluminum for carbureters or elsewhere in contact with the fuel to eliminate all possibility of oxidation by alcohol, provided the exposed surfaces of the motor never come in contact with anything but pure ethyl alcohol. But, unfortunately, these surfaces are in contact with the air; with water; with the denaturants called for by the excise regulations; with those carburents that are frequently added to the alcohol, and with the products of combustion.

While gasoline is to a certain extent a lubricant that insures the metal against the oxidizing action of the air or water, alcohol is a solvent, and in lieu of preserving the metal against oxidation, it renders it subject to the action of whatever oxidizing influences it may happen to come in contact with. Experience shows, however, that metals suffer little from the action of the oxygen in the air or water, and it is easy to preserve surfaces that have been cleansed by alcohol from a prolonged contact with either, simply by the use of small amounts of lubricating oil from time to time.

But these do not constitute all the difficulties by any means, and the greatest of these is the fact that the alcohol is never employed pure, but denatured. In addition to ethyl alcohol, the fuel mixture called for by the government regulations contains a composition to the extent of 10 per cent. of the whole, consisting of the following:

Methyl alcohol, hydrated .....	.725
Acetone .....	.25
Pyrogenic impurities .....	.025
Benzene (government specification) .....	0.5001

At ordinary temperatures methyl alcohol and acetone have no effect on the series of copper alloys, such as copper, lead, etc., nor on those of iron, such as iron, nickel, zinc, chromium. But the pyrogenic impurities will certainly have some action due to the presence of pyroligneous acid. Fortunately, this acid only exists in extremely small quantities and it is rendered inoffensive by its combination with alcohol, in the form of ether. As it is impossible to be certain that the etherification is complete, the few thousandths of pyroligneous acid not absorbed are always to be feared, and should lead to a demand for a diminution of the proportion of the denaturant.

The carburents which are generally mixed with the alcohol, may also have a deleterious effect on the metals proportionate to the amount of impurities they contain. Of all these carbureting substances, up to the present, the greatest success has been attained with benzene. It does not attack metals, but it may contain sulphur or sulphuric products due to its origin (*i. e.*, from coal

tar), and it is well known that this sulphur is a powerful solvent, which contributes to prepare the metallic surfaces to enter into combinations with other attacking substances. Under the influence of heat it will sulphuret zinc, copper, and also iron, but, fortunately, it is easily possible for the refiners to supply benzine that shall not be contaminated by more than infinitesimal quantities of this deleterious substance.

It frequently happens that in the extraction of the light oils contained in coal tar from which benzene is produced the sulphuric action combines with the carburets of the aromatic series, giving sulphurous products, and in particular, sulphurous benzene acid. This acid attacks metals even when cold. But generally the presence of these sulphurous products need not be considered as an obstacle to the use of alcohol, though it may be well to indicate the influence that these impurities may have in order to direct the attention of the distillers to this point.

We may now take up the effect which the products of combustion of the alcohol may have on the metal surfaces of the motor. Theoretically, alcohol in burning produces carbonic acid and vapor of water as follows:

Ethyl alcohol      Oxygen      Carbonic acid      Water vapor

It may be well to remark that this combination does not become complete unless the conditions of the reaction are fulfilled; that is, unless the alcohol vapor is intimately mixed with seven times its own weight of air and the temperature is in the neighborhood of 1,500 Centigrade. Practically, these conditions are never exactly fulfilled, and in adding to that consideration the fact that alcohol denatured according to the government specifications contains large quantities of impurities, as we have already indicated, it is not to be marveled at that the secondary reactions, which in addition to the principal reaction, give birth to a number of products, of which we only enumerate those which may prove a menace to the cylinders and valves, such as acetic acid, formaldehyde, trioxymethylene, and, with certain carbureted alcohols, sulphuric acid. This last acid is derived from the combustion of the sulphur contained in the sulphurous benzene acid, found in the benzines extracted from northern oils. With a certain amount of care in the distillation of the coal-tar, it is possible to achieve the almost total elimination of sulphurous products. The formaldehyde, due to the denaturant, does not appear below 450 degrees C., and at about 300 degrees the proportion is minute.

The presence of *trioxymethylene* has been observed in the exhaust gases at a dull red heat—600 to 700 degrees C., and in very small quantities; this substance is formed by contact with the hot walls of the exhaust ports. But the most dangerous product is the acetic acid, which attains to a proportion of 14 to 15 per cent. of the alcohol while combustion is incomplete; that is, a temperature around 400 degrees C. At 600 degrees C. not more than a trace of acetic acid is found. On the whole, the dangerous products are not formed except at a relatively low temperature, so that it is only while getting the motor under way that they are to be feared, that is, during a very short time. And it may well be asked, if the rapid contact of these extremely diluted vapors of acetic acid and other ethers and aldehydes really constitute a serious danger to the alcohol motor. Up to the present experience has demonstrated that the danger is hardly of sufficient moment to be seriously considered.

As a result of the extended and minute laboratory investigations of MM. Sorel, G. Chaveaux and Boulanger, it may certainly be said that the accusations against carburetted alcohol are not well founded. We may also call attention to the results of the test published by Cormier, in which a motor was dismantled after having been run 1,200 kilometers on carburetted alcohol without the slightest traces of deterioration being revealed.

\*Translation from "La Vie Automobile," Paris, by Charles B. Hayward.

# A CHAPTER ON MAGNETO IGNITION\*

By ELMER G. WILLYOUNG.

THERE are two fundamental methods of electric ignition, viz., the "make and break" or low-tension, and the "jump spark," or high-tension, system, and each of these systems may be actuated by either dry cells, accumulators, or mechanical gen-

FIG. 24.—Typical magneto form.

FIG. 25.—Armature.

erators. As used in the text, "mechanical generator" means a miniature dynamo driven in any convenient manner from the motor and delivering direct current; it supplies its own exciting current for the field magnets, has its own commutator, and is in every way a reduced copy of an orthodox dynamo.

In a self-excited dynamo, part or all of the current generated is passed around the soft iron field, and hence this current must be constant in direction and uniform in value in order that it may give to the field the constant magnetic properties necessary to the continuous generation of current in the armature. Its disadvantages are: (1) That it requires high speed (1,800 to 2,500 r. p. m.) to develop sufficient actuating current, thus making it necessary to start the motor on a battery; (2) uniform speed, especially with the jump spark system, because here the vibrator is exceedingly sensitive to changes in current, and, in fact, only works satisfactorily and without excessive burning of the contact points when the current is maintained within certain and quite narrow limiting values; burning of the dynamo commutator is also a result of varying speeds. A governor must therefore be provided and so set that a certain normal speed (obtained with a normal rate of motor speed) will never be exceeded, and this is, necessarily, a delicate added complication. So that mechanical generators have not been satisfactory.

This brings us, logically, to the magneto system, which is essentially nothing more than a substitute for the dynamo just described; a special form whose field, instead of being soft iron temporarily excited by the operation of the machine itself, is of steel magnetized permanently. In Fig. 24 we have a typical form of magneto and in Fig. 25 the corresponding armature; Fig. 26 shows (dotted lines) the direction and distribution of the magnetic force before the armature is in place; while in Figs. 27, 28, 29, and 30 the armature is inserted and we see the changes in magnetic distribution corresponding to its angular advance. The magnet is of steel specially treated and very hard, and the armature of very soft iron of "dumb-bell" section; about the neck of the bell is wound a suitable number of turns of insulated copper wire.

The conventional method of representing magnetic forces is by lines, the direction of these lines showing the direction of the force, and the number or density of the lines to a given area, the intensity of the force. Each line will always make up a

closed curve such that if a short magnetic needle be freely suspended so as to touch the curve at any point, it will always be tangent to it. These lines of force will always pass more easily through a magnetic material than through a non-magnetic material (or air), even though this involves an actually longer path. Thus in Fig. 26 we see the lines passing almost uniformly from pole to pole, but as soon as the armature is in place, as in Fig. 27, the lines immediately "bunch up" and pass across through the dumb-bell, although having to go further to accomplish it. In Fig. 28 the armature has advanced about one-eighth turn, and we see the lines still within it, though badly twisted; another one-eighth turn and the lines have divided and no longer interlace the armature wires, but pass straight through the heads of the bell; last, Fig. 30, we have the lines again passing through the neck, but in the reverse direction to before.

Now it is a fundamental electrical fact that whenever a magnetic line and an electrical conductor "cut across" one another, from whatever cause, and "electro motive force" (E. M. F.) is generated in the conductor and the intensity of this E. M. F. will be directly proportional to the number of lines cut across in a unit of time, and if the conductor ends be joined by a connecting circuit of any kind, there will be, in such circuit, a correspondingly greater or less current. Starting with Fig. 27 we get no cutting and no E. M. F. for nearly 90 degrees, when, suddenly, all the lines are "snapped" out and, note particularly, "snapped" in again in the reverse direction; i.e., between Fig. 28 and Fig. 30 we have cut the same lines twice, which is equivalent to cutting twice the number of lines once. As this action takes place there is a very sudden rise of voltage in the armature conductor and an equally sudden falling away of the same (actually in the best magnetos the entire effect begins and ends within about 10 degrees of rotation angle). As the armature continues to revolve, we once more have quiescence until "A" is nearly at the bottom, when again we have the same strong impulse of E. M. F., but in the reverse direction with reference to the conductor (and therefore the terminals), which is now turned end for end. There are thus two "peaks" of voltage (and current)

FIG. 26.—Direction and distribution of magnetic force before armature is inserted.

FIG. 27.

FIG. 28.

Showing changes in magnetic distribution corresponding to angular advance of armature. Lines "snapped" out and "snapped" in again in reverse direction

\*Extract from Copyrighted Lecture No. 4, Correspondence School of Motor Car Practice, organized by the Maxwell-Briscoe Motor Company, Tarrytown, N. Y.

FIG. 29. Showing further changes in magnetic distribution owing to continued angular advance of the armature. FIG. 30.

to each revolution of the armature; this is shown in Fig. 31, the curve above the zero line being +, and that below the line —.

In practice, since we can only produce powerful currents at these two definite positions of the armature, it is necessary to gear the magneto positively (not belt it) to some part of the power plant, generally to the half-time shaft, so that the same angular position of the armature will always correspond to the same definite position of the piston in its cylinders; the ratio of the gear will, of course, depend upon the number of cylinders to be fired—thus, for a two-cylinder car, the armature would revolve at half the motor speed; for a four-cylinder car at the motor speed; for a six-cylinder car at one and one-half times the motor speed, etc.

In the low tension magneto there is but one coil of wire wound on the armature; the contact points within the cylinder are sharply separated at the proper time, exactly as in the battery "make and break" system, and the armature, which is at its critical angle, sends its surge of current across the gap. With the high tension magneto several distinct types are in use; each type has its friends, each does good work, and, as among the types, when judged by their best exponents, there seems but little choice. One type is represented by the Eisemann, in which the single-wound armature supplies current to the primary of a non-trembler outside induction coil, thus being essentially, after all, a low tension magneto operating a "jump spark" coil, but securing the discharge spark by a positive mechanism attached to the magneto, instead of by a vibrator. The matter of getting the maximum current impulse in this particular magneto is unique in that the discharge is the result of a "make" instead of a "break," as usual; the armature winding is normally short-circuited, thus giving it a very low resistance, so that the E. M. F. develops a very large current. Just as the spark is needed in the cylinder the mechanism suddenly opens the short-circuit, thus sending a rush into the primary of the coil and inducing a current in the secondary with consequent production of the desired spark.

Another, and this is the most widely used type, is that in which there are two windings on the armature, one of few turns of rather heavy wire and the other of many turns of fine wire; these windings correspond to the primary and secondary in the ordinary induction coil. When the armature rotates, the primary generates current which, broken at the right time, induces a high E. M. F. discharge in the secondary. The Lacoste and Gianoli magnetos are both of this type, as is also the Bosch; in the last named, however, the armature remains fixed and a rotating sleeve of soft iron having oppositely disposed 90-degree segments cut away, and lying between armature and pole pieces, is used to carry around the lines of force and cause them to cut the conductors.

The usual method of making the discharge spark is, essentially, to have a fixed point attached to the armature shaft strike another point located externally; thus a cam lifting a contact lever is a common device. To time the spark, therefore, it need merely be arranged so that the outside point or arm may be rotated one way or the other according as it is desired to advance or retard the spark; as, however, but little angular rotation would be required to get outside the limit maximum current it is more usual to accompany this movement of the outside contact by an adjustment which will correspondingly alter the angle of the maximum current. This is done, in the Eisemann, Lacoste, and Splitdorf by having the driving shaft and the armature shaft separate, but joined by a pin attached to one shaft moving in a spiral groove attached to the other; the armature can thus be bodily rotated with reference to the driving shaft, while running at full speed. In the Gianoli and Remy magneto the maximum is shifted by having a movable soft iron sheathing cylinder (opposite 90-degree segments cut away) between armature and pole pieces; shifting this sheath angularly amounts to rotating the poles.

The magneto is a positive mechanical device, simple in its essentials, and hence capable of being strongly and durably built; it cannot depreciate any more rapidly than other well-made mechanism. It furnishes current only when it is wanted (when the motor is running), and derives its energy from the motor itself, though taking an insignificant amount of power.

Since the E. M. F. increases directly with the speed it may be asked whether, at high speeds, there may not be risk of "burn out" of the armature? The reply is that the current, being alternating, cannot rise as fast as the E. M. F. on account of the impedance of the circuit, and further, that in any case, the higher the speed the more E. M. F. and current is needed, since the more highly compressed gas requires greater E. M. F. to penetrate it. Impedance is the quality of a circuit by means of which it offers resistance to varying currents; it includes the usual conductive resistance together with other factors, such as rate of variation of the current, amount of magnetic material associated with circuits, etc., etc. In practice "burn outs" are very rare.

A great defect in the magneto is its low E. M. F. on low speeds, thus making it difficult to start up. It is quite common, therefore, to employ a coil vibrator outfit for starting, and then to throw over a switch so as to "cut in" the magneto. Some magnetos are much better than others in this respect, but

FIG. 31—Showing peaks of voltage (and current) at each revolution of the armature.

the objection obtains to a greater or less extent with all of them. All in all, however, there is no question but that, in the present state of the art, the magneto is the coming standard mode of ignition. It is simple, it is positive, it wastes nothing, it is always ready, and last, but not least, it is efficient. The suddenness and intensity of explosion in the cylinder, and therefore the power, seem to be dependent upon the "hotness" of the spark; with a trembler coil and battery we cannot possibly, except with a much larger coil than is now commonly used, get a spark even approaching that of the magneto in size and temperature. We cannot use a large current because the vibrating mechanism of the coil will only give even reasonable satisfaction when it is run very lightly and delicately.

## LETTERS INTERESTING AND INSTRUCTIVE

### IN DEFENSE OF MR. FAY ON ALUMINUM.

Editor THE AUTOMOBILE:

[870.]—The title of Mr. Edgecombe's communication, No. 859, is a misnomer, if anything, on the ground that the promised "More light on the subject of aluminum" did not illuminate.

I submit that a one candle-power wax taper lost in infinite darkness would cast a far less sallow flicker than all Mr. Edgecombe has had to say. To begin with, he is wide off the mark when he quotes Mr. Fay, because he failed utterly to grasp the situation as set down by Mr. Fay about aluminum.

I read Mr. Fay's communication about aluminum and fail to find anything therein in any way unfair to the aluminum situation. Mr. Fay gave tests of various mixtures of aluminum as found in castings furnished by various foundries at diverse times, and the results given are worth far more to engineers and automobile builders than any amount of soft talk.

The weakest link in any chain is as the strongest, and it makes no difference at all, if on occasions some castings prove to be of quite high value, for the very reason that all castings cannot be relied upon to hold the higher strength, possible under certain conditions. Moreover, the automobile builder who has had no trouble with aluminum has not as yet completed his first model.

What Mr. Fay advices is along good engineering lines, i. e., take into account the inherent weakness of aluminum and by so doing realize all its advantages without having to suffer the consequences of considering the maximum possible strength; in other words, design on a basis of the aluminum probable strength, just as all engineers do when steel, cast iron, or wood, for illustration, are the materials of construction.

Mr. Edgecombe did not quote Mr. Elwood Haines correctly, because he failed to observe that Mr. Haines pointed out the brittleness of aluminum-zinc alloys. Moreover, Mr. Edgecombe's strictures on Mr. Birdsall's observations lack edge, since he says "it is dangerous to give chemical composition" on the ground that they would not be mixed right. Does Mr. Edgecombe wish to infer that he has a monopoly of brains? Anyway, when the danger of mixing is so great, why not tell not only the composition, but the mode of mixing also?

Mr. Edgecombe says in substance, "put blind faith in the Pittsburgh Reduction Co." What principle of business does he call into play that demands a blind investment? This is the method usual to the purchasers of "gold bricks." Does Mr. Edgecombe wish to infer that aluminum is a gold brick proposition?

Mr. Edgecombe says, "I enjoyed Mr. Blough's article . . . ." Why? Was it a joke? Certainly Mr. Blough, out of his infinite fund of knowledge, allowed none of it to percolate.

Mr. Fay, unlike others who "essayed" to divulge information, "delivers the goods," and of all whom I have observed was the only true defender of aluminum, because he clearly pointed out its characteristics as well as its advantages, and by so doing rendered it possible to proceed to use aluminum along safe lines. True, Mr. Fay deplored the lack of strength in aluminum castings, but what of it? Who does not? Moreover, who would be so scant in keenness as to accept a mere puff by an engineer in the employ of makers of aluminum as against common knowledge, to say nothing of the definite unbiased information from a well known engineer whose painstaking work in the metallurgical field, especially as regards materials for automobiles, has been a conspicuous feature for several years?

Let us have light by all means, but it may be just as well to say the glimmer from a tallow tip can scarcely serve to drown the electric arc, although a "dip" might be the source of all the illumination that a great number of aluminum castings could stand and not go awry.

JOSEPH SCHAEFFERS.

New York City.

The title which you find misleading was the work of the editor, and not that of Mr. Edgecombe, though, of course, it did not influence nor alter what followed.

### FASTEST SPEED ATTAINED ON WATER.

Editor THE AUTOMOBILE:

[871.]—To settle a dispute, should be glad if you would state the fastest speed attained by any motor boat, American or foreign, over a long-distance course.

J. A. THOMPSON.

Providence, R. I.

*Panhard-Tellier*, a French boat, established the world's record at the Monaco meet this year, when in the Championship of the Sea she covered 200 kilometers at an average speed of 35.01 miles an hour. *Dixie* holds the American record.

### TWO AND FOUR-CYCLE DIFFERENCES AGAIN.

Editor THE AUTOMOBILE:

[872.]—Will you please explain through Letters Interesting and Instructive what is meant by "two-cycle" and "four-cycle" in connection with gasoline engines, as I frequently see these terms in print, and would like to have the difference between them explained.

E. B. D.

Walcott, Ind.

Two-cycle, or, technically speaking, two-part cycle, which has been abbreviated by popular usage to the familiar term you mention, refers to an engine in which the two parts of the cycle known as the explosion and the exhaust take place on the down stroke, and the other two of suction and compression occur on the up stroke, so that the motor delivers a power impulse for every revolution of the crankshaft. Four-cycle, or four-part cycle, means that the four parts of the cycle take place independently, each necessitating a stroke of the piston for its completion. Thus down stroke, suction; up stroke, compression; down stroke, explosion; up stroke, exhaust and repeat; these constituting the four parts of the cycle. This matter has been explained at length very frequently in these columns, and you will find these, as well as detailed articles on the subject, in the back numbers of THE AUTOMOBILE.

### SPRINGS AND CENTIMETER VALUE.

Editor THE AUTOMOBILE:

[873.]—Will you kindly inform me what is the generally accepted definition of a 100-pound spring; also, can you give me the value of one centimeter into inches in more decimal places than that given in hand-books, namely, 1 centimeter equals 0.3937 inches?

Toledo, Ohio.

CHAS. H. WARING.

In general acceptance a 100-pound spring is one whose safe limit of stress is 100 pounds. All engineering hand-books give tables of the carrying capacity and deflection of various types of springs. To take one example at hazard, a  $\frac{3}{8}$ -inch round steel helical spring of 3 inches outside diameter will carry with safety a load of 473 pounds, assuming that it is for intermittent working, as in a steam engine governor or safety valve. Every handbook gives one centimeter as equal to .3937 inches, and for ordinary calculations this is sufficiently exact. Worked out to its full number of decimal places, however, the value of one centimeter is .393707904 inch; this value is used in compiling all comparative tables.

### MR. EDGECOMBE "SHEDS" MORE LIGHT.

Editor THE AUTOMOBILE:

[874.]—While I deplore the circumstances that impel me to crave further space to again take up the cudgel in defense of aluminum, I do so, offering but one excuse, i. e., "the enemy persees." If Mr. Edgecombe had succeeded in shedding light all would have been well, but my fear is the "cable tow" he used lacked strength, parted, and the light escaped, perhaps, to the place from whence it came. At all events, I am grieved to think Mr. Edgecombe should so translate my English as to make it a strange tongue to me, and I am bound to say he is cranking a grindstone to the tune of somebody else's axe.

The sense of my aluminum articles may be stated in few words, i. e., the uncertainties of the foundry are such that aluminum castings must be regarded from the point of view of the minimum strength of castings procurable and likely to be realized in the regular course of business. I have repeatedly stated that the desired qualities of aluminum, such as lightness, ability to assume intricate shapes, etc., is a large recompense, but it is a great mistake to make designs on a basis of the high figures of "Lake" or the loud talk of "boomers."

In honestly setting down the facts, I consider I am the defender of aluminum, whereas its greatest enemies are those who talk maximum possible values only, thus leaving it to purchasers of

automobiles to discover at their expense and inconvenience that the real use of aluminum dominates the situation.

Mr. Edgecombe says (of one of my tests) "they are quite correct for an alloy such as be cites, but the chemical analysis tells the story, it is an art alloy, a brittle, crystalline, gray-white metal, which would run very liquid and be fine for casting tin soldiers." Of this statement it may be looked upon in two ways, viz.:

(a) Mr. Edgecombe fell off of his high chair after inspecting one test only, thus missing all others.

(b) The foundry that made the motorcase castings, from which I took the casting specimen, considered it an advantage to use an alloy that would run liquid and be fine for castings.

This phase of the situation does not interest either myself or automobile builders, since the tests were made from castings that "failed in service" and were aluminum castings from representative sources.

Mr. Edgecombe says: "Don't let the foundryman get scared because he thinks this metal—ingots from the Pittsburgh Reduction Company—is too cold to run." The only scare I know of that can be pumped into a foundryman is the reduction company's price scare; it is quite as stable as the aluminum.

I desire to join Mr. Edgecombe in his enjoyment of Mr. Blough's article—it was a good joke—but this does not debar me from observing that Mr. Birdsall had an apt way of "serving out his 'petulance,'" and I doubt that some folks would care for the other six courses.

I cannot take time to mention the fallacies in all of Mr. Edgecombe's three-legged arguments, but I do hope he will come to the defense of aluminum and not try to get poor automobile devils into trouble by inducing them to accept values for the strength of aluminum "not obtainable in practice."

THOS. J. FAY.

New York City.

VIEWES OF A SENSIBLE AUTOIST ON SPEEDING.

Editor THE AUTOMOBILE:

[875.]—As a rule I never like to appear in print, but I see and hear so many things that might be of some interest to the automobile world. For many years I have been coming up here to pass my vacation, as the country is so beautiful and the air refreshing. Also the roads are fine and level, which is what the man with an

DRAWING SHOWING DANGEROUS SPOT IN ROAD NEAR SCHOOL.

auto is looking for. Now my purpose in writing these few lines is to try and caution my friends against driving too fast. I am staying at a house that is surrounded by roads, and I believe that from 75 to 100 autos pass during the day, and if some of them could realize the speed they were going, and the risk, they would be surprised. I have been expecting for the past two weeks to see an accident hourly, and it finally happened on Sunday evening at 5:30 p. m., resulting, perhaps, in the death of two people.

Now, what is the reason for fast driving? I have seen them going at 45 miles per hour most every day, and in this case there is a slight rise in the road about a quarter of a mile from the school-house, and when the autos strike it they seem to bound up in the air and then down. And what is the consequence? Broken springs, or axles, and many other troubles. We people that are of a prudent nature are almost afraid to venture on that one road. In the above accident I found rear left wheel broken, tire burst, front axle broken at knuckle and sagged in center (axle made of bronze). I also ascertained from a thorough examination of the automobile that after its terrible plunge at right angles to the road it was in good condition, and the engine kept running for several minutes.

As there were many sitting around at the house, we rushed to the automobile and righted same, as a minute lost would have meant

instant death. We telephoned for doctors immediately, who arrived in fifteen minutes, had special car provided, and they were taken to Albany to a hospital. I may add that those on the right-hand side of the car did not have a scratch.

As an automobilist and engineer, I take great pleasure in the sport, which is a grand pastime and health restorer. I am one of your old subscribers.

HENRY NICOLL HAMILTON.

Kinderhook, Columbia Co., N. Y.

AMERICAN CARS WITH WATER-COOLED BRAKES.

Editor THE AUTOMOBILE:

[876.]—In the August 8th issue, No. 848 writes for information as to the method of fitting water-cooled brakes, and in your reply to his communication you state that "so far as known, no American cars have been built with water-cooled brakes, although there are several localities in this country that would seem to require them."

We have tried to give as wide publicity as possible to the fact that there is one American-built car which is fitted with water-cooled brakes, and that is the Lozier. Every car which we have turned out this year is fitted with brakes of this kind. The water is carried in a three-gallon tank suspended from the chassis. The brake drums are hollowed to carry water, the water being automatically fed to the drums of the brakes by means of air pressure. When the brake pedal is operated, an air valve is automatically opened and the circulation of water started. When the pressure on the brake pedal is released, the flow of water ceases. In level country, where water-cooling is not necessary, the system can be disconnected by closing an air valve. With this system it is possible to keep the brakes on constantly on a very steep grade for thirty minutes without any danger of overheating or burning.

LOZIER MOTOR COMPANY,

New York City.

C. A. Elmise.

Editor THE AUTOMOBILE:

[877.]—In your issue of August 8th I read an inquiry regarding water-cooled brakes on American cars. You state that so far as you know, no American cars have ever been built with water-cooled brakes.

For your and the reader's information I would like to state that the Matheson cars built in 1904, 1905 and 1906 were all equipped with water-cooled brakes located at the sprocket shafts each side of the transmission case, and were of the hollow drum type, water being supplied from copper pipes from a separate tank located under the front seat. In some cases short pipes were used with a funnel, located under the footboard in the tonneau, into which water could be poured very readily, filling the big drums, which held about half a gallon of water each. This was found to be sufficient to descend the steepest hill without completely evaporating the water. Our experience has been that the ordinary automobile user will not take the time to fill this auxiliary water tank, nor fill the tank through the funnel, and we have therefore discarded this system in our 1907 car by compensating for this omission by making the brake surface more liberal. Our present cars are equipped with two transmission brakes 10 inches in diameter 2-inch face; two rear hub brakes 15 inches in diameter by 2-inch face, all brakes and shoes being metal, the brake drums being steel and the shoes of Manganese bronze. With this size of brakes we find it possible to travel all over the mountains of Pennsylvania, known for their extreme gradient, without having brake troubles. In fact, some cars will run a whole season without requiring even an adjustment on the brakes.

MATHESON MOTOR CAR COMPANY,

Wilkesbarre, Pa.

Chas. R. Greuter.

A FLORIDIAN'S WANTS ARE CONCISELY STATED.

Editor THE AUTOMOBILE:

[878.]—I want an automobile—medium priced—one that will have a small repair bill—one that will take our sandy Florida roads—one that will track with our wagon roads, 61 inches—a light touring car for four persons—something that is easily handled and will give satisfaction—not over a \$1,200 car. What would you advise me to buy and where to buy it?

Would you advise me to buy a second-hand car, if in good shape and could be bought at a big discount from regular price?

Arcade, Fla.

J. L. JONES.

MECHANICAL MAN WANTED—NEW FACTORY.

Editor THE AUTOMOBILE:

[879.]—Do you know of a good automobile man who can take charge of the mechanical department of a new automobile factory which is just being started? We have an inquiry for such a man, one who can make good. If you can put me in communication with a reliable and capable man it may result in benefit to him, and I will appreciate the favor.

W. H. MANSS (G.),

Chicago, Ill.

Industrial Commissioner, C. B. & Q. R. R.

PRESIDENT ALEXANDER WINTON AND SALES MANAGER CHARLES B. SHANKS TALKING OVER THE WINTON'S GOOD POINTS.

"SIX-TEEN-SIX" is the title of the latest Winton product, and its uncovering is, moreover, an announcement that its sponsors, the Winton Motor Carriage Company, Cleveland, O., mark one of the most recent accessions to the ranks of the builders of six-cylinder cars. As a foreword in favor of their new production for 1908, the makers preface their introduction to its mechanical features with the following:

"The division of a horsepower into six equal parts as against four equal parts provides evidence that the smaller cylinders do the better work. The six-cylinder motor has six power strokes on each two revolutions of the crankshaft, whereas the four-cylinder motor has but four power strokes. Power strokes in the six-cylinder motor overlap each other, whereas in the four it is impossible to have a fresh power stroke until the power of the previous stroke has been completely negated."

So much for the maker's introduction. As for the car itself it will be noticeable from its portrait, published herewith, that it is a fitting representative of the long line of Wintons that has preceded it into the past of discarded designs, and is well equipped in every respect to maintain the standard achieved by them. But while a car of this number of cylinders is a newcomer in the Winton household, its advent is hardly the result of its creator having just come round to the principle, as it will be recalled that Mr. Winton has long been an advocate of the multi-cylinder type of motor, having used an "eight" on his racing machine as far back as 1903.

In designing the new motor, the plan of casting the cylinders in pairs has been adhered to, thus bringing its total length down to a minimum and not entailing a bonnet much longer than is to be found on many a car of fewer cylinders. The cylinder dimensions are 4 1-2-inch bore by 5-inch stroke, the entire heated portion of the cylinders being liberally jacketed. At first

glance it will be seen that the new motor is distinguished by the adoption of a practice that has long been advocated by certain engineers, but which has, so far as known, been confined to one or two cars made on the other side up to the present. This is the provision of a protecting case, or pocket, for the valve rod, plungers and springs, which, while rendering them proof against the action of dirt and grit, does not make them any the less accessible than formerly owing to the liberal sized and easily detached sheet steel covers.

Both the cylinders and the camshaft are offset, this being a feature of the Winton Model M of last year, and the valves are all on one side of the motor. This method of placing the camshaft makes it readily removable as a single piece through the front end of the engine. The motor gears are all placed forward and are of hardened steel, alternating with brass or white fiber. The pinions, as well as all the other working parts, are thoroughly enclosed, this protection even being extended to the plugs over the valves. The aluminum crankcase is split into right and left-hand parts to facilitate access to and removal of the crankshaft or connecting rods and pistons without disturbing the cylinders or their connections, and all bearings are attached to the stationary side so as not to be disturbed by the making of other adjustments.

A refined and enlarged edition of the multiple-disc type of clutch, first adopted last year, constitutes the first step in the transmission of the power. It consists of sixty-five discs, providing 33 1-3 per cent. greater friction sur-

SIDE ELEVATION "SIX-TEEN-SIX" SHOWING CONSTRUCTIONAL DETAILS.

LEFT-HAND VIEW OF MOTOR, SHOWING VALVE SPRING COVERS, ETC.

face than that of its forerunner just mentioned. It is held together by six springs placed at equidistant points round the outer circumference of the clutch, thus distributing the tension to much better effect and also greatly reducing the possibilities of being stranded through the defection of this essential, as is the case where reliance is placed on a single spring.

The clutch is supported on ball bearings and runs in an oil bath, though it is readily accessible and any one of the springs may be easily removed or replaced. By the addition of simple and compact devices, the clutch can be locked in the disengaged position without interfering with the brakes.

That fashion dominates engineering practice is evident from the fact that the next step in the transmission consists of a three-speed gear set, which the makers are frank to state is fitted more to comply with the prevailing demand than because this number of speeds is required.

This gear-set is of the sliding type, works on the selective method of speed changing and gives the direct drive on the third speed. The shafts are mounted on ball bearings throughout, and the special interlocking mechanism is incorporated in the housing, thus protecting every operative part. Final drive is by means of a propeller shaft, and this has been so designed with relation to the remainder of the car as to lie in practically a horizontal plane under a wide range of varying conditions of load. To provide against relative movement, due to inequalities of the road, a flexible coupling is provided between the clutch and the gear-set, with two roller type universal couplings in the driving shaft.

The same attention to providing thorough protection for all working parts has also been extended to the drive. The torsion rods are equipped with ball joints and are of an improved type. The rear axle is of the floating type carrying no load, and the axle shafts, differential gears and pinion shaft are all removable without the use of a jack or pit, the car always being supported by the wheels. The rear axle unit is distinguished by the use of Timken roller bearings throughout.

To come back to the motor, there are also several new features of note to be found where its accessories are concerned. The new carbureter is provided with two nozzles and two throttles, both of which operate in conjunction

with one another and progressively, the smaller of each opening first and later picking up the larger as the requirements of the motor increase. Special attention has been paid to the ignition, and while this is in duplicate the systems have been made very compact and simple. An Eisemann high-tension magneto constitutes the chief standby, while current for the second system, which is supplied by accumulators, is led through the distributor on the magneto and the single vibratorless coil of the latter before passing to the plugs. For lubrication a gear-driven Hancock oiler is provided, an independent oil pump forcing the oil from the crankcase to a filter and thence to the oiler, from which it again emerges through twelve separate leads taken to the various important points, so that the same oil is used constantly as long as it is of any value. Cooling is taken care of by a fin tubular radiator supplied by a gear-driven centrifugal pump and supplemented by a fan, also gear-driven and provided with a friction clutch.

Where the remainder of the car is concerned, it may be said to embody practically all those features that have distinguished its predecessors of the Winton line. This is noticeable in the use of Winton twin springs, the Parsons manganese bronze front axle and other familiar essentials, though there are, of course, many detailed refinements, such as the use of aluminum for the bonnet, the sides of which open by means of spring plungers, the mahogany, steel-hooded dash carrying an auxiliary gasoline tank and the like, which go to show that no pains have been spared and not even the smallest detail has been passed unconsidered. Thirty-six-inch wheels have been adopted.

In discussing present-day tendencies in automobile manufacture and design, Mr. Winton says: "If I were not well convinced that the six-cylinder car is far superior to previous types, I certainly would not have begun the manufacture of six-cylinders exclusively, as our company is now doing. Six-cylinder advantages are so fully acknowledged by automobile engineers that it is impossible to raise an argument. Constant power, absence of vibration, great power in reserve, wonderful flexibility, less weight per horsepower—all that the motorist desires, he finds in the six. And in our own construction we show actual simplicity, all working parts housed and lubricated, combined with almost instantaneous access to all working parts. We have eliminated complication. We use a single coil in company with a magneto.

RIGHT-HAND VIEW, SHOWING MANIFOLD CARRIED ACROSS CYLINDERS.

the price of which alone is a guarantee of superior excellence. This new model of ours will serve to prove American supremacy. That has been my constant aim for years. I am ready now to let the public judge whether it be true or not, and instead of asking them to go to New York to see, I am having our new model brought to their home cities."

In regard to this latter feature of displaying the new models in the leading cities, two exhibition express cars will be used, one traveling east from Cleveland and one west. Each show car will carry two demonstrating models of the Winton, an enameled chassis, a fully equipped exhibition model, and a corps of demonstrators. Upon arrival at each city, the exhibit will be taken to the company's salesroom and there displayed from one to four days. The western itinerary is as follows: Toledo, Detroit, Cincinnati, Louisville, Indianapolis, St. Louis, Chicago, Milwaukee, St. Paul, Minneapolis, Omaha, Lincoln, Denver, Salt Lake City, Los Angeles, San Jose, San Francisco, Portland, Tacoma, Seattle, Vancouver and Winnipeg. The eastern itinerary includes: Pittsburg, Washington, Baltimore, Philadelphia, Newark, Newburg, N. Y., New York City, Brooklyn, Bridgeport, Boston, Taunton, Providence, Middletown, Conn., Hartford, Springfield, Troy, Albany, Syracuse, Rochester, Buffalo and Toronto.

#### Some Good Winton Money for Careful Drivers.

In connection with a plan formulated by the Winton Motor Carriage Company, which puts a premium on careful driving, there is a chauffeur somewhere in this country who will win \$1,000 in gold for his strong use of common sense, and nine others will divide \$1,500 in cash prizes, graded from \$500 down to \$100. In placing the Winton "Six-teen-Six" on the market, the output of which is limited to 500 cars for 1908, its makers are desirous of securing a complete and authentic record of the performances of each, and are offering \$2,500 in gold as an incentive to the drivers to keep accurate tabulation of mileage and upkeep expenses. The chauffeur who proves the best record will receive \$1,000, the second best record will win \$500, the third \$250, the

fourth will get \$150 and the next six will be given \$100 each. "We offer these prizes as a premium on intelligence and carefulness," says Mr. Winton. "No automobile manufacturer in the world has anything like an accurate record of the work performed by the cars of his make, but we propose to secure such a record. This plan ought to be effective, because it provides ample payment for the man who keeps tab. That the records may be absolutely accurate in detail, each contestant will be required to have his report acknowledged by his employer and sworn to before a notary public. When the contest closes a committee, composed of automobile editors of leading daily papers will be asked to make the awards."

Mr. Winton emphasizes the point that this contest operates to the distinct advantage of the car owner, as follows:

Each competing chauffeur must drive for the same owner throughout the contest, hence the man who stands to win \$1,000 is certain to give his employer the most faithful service and will hesitate before he jumps his job in midseason.

The report is based on average cost of repairs per mile, hence the chauffeur will endeavor to avoid repair bills and will do his best to give his employer maximum mileage at minimum expense.

In order to avoid repair bills the driver will exert himself to handle the car intelligently, to understand its care and repair so that he can keep it in constantly good running condition, and especially to avoid reckless driving, which, more than any other single item, helps to keep repair shops busy.

Under the Winton prize plan the chauffeur who runs up repair bills is virtually paying for them out of his own pocket, inasmuch as each such item of expense puts him farther away from the \$1,000 first prize.

#### WHY A MOTOR LOSES POWER.

Keeping a car tuned up to its highest point of efficiency should naturally be the effort of every driver, and the following suggestions from J. D. Maxwell are well worth reading:

"I am continually surprised that the majority of cars show up as much power as they do. You meet occasionally men who take a pride in keeping their power up to where it ought to be, but by far the greater class seem to be thoroughly satisfied if the cars run at all.

"There are three great causes for loss of power in a gasoline motor. Probably the most serious offender is the lack of compression. The valves should be carefully ground in and care should be taken that there are no leaks either around the spark plugs or the valve caps.

"The electrical ignition is also usually carelessly taken care of, and it is a fact that the intensity of the electric spark is a most important factor if the motor is to develop its full power. A third and last cause is improper mixture of the gasoline and air; or, in other words, the carbureter should be properly adjusted.

"There are, of course, several factors that enter into each of the above three general causes, but you can take it as an axiom that when the compression, the electric system and the carbureter are all in proper condition the motor will show up its full power."

#### CHICAGO TO HAVE A PARTS SHOW.

It is announced that Chicago is to have two shows this winter after all. The National Auto Parts Show promoted by A. M. Andrews, which was held for the first time last year early in the fall, was to have been repeated at about the same time this year, but in response to a demand on the part of those dealers who participated in last year's event it has been decided to hold it concurrently with the National Show, which is set for the week of November 29 to December 6. There were 85 exhibitors at last year's show, and it is expected that the number will be increased this year. The show is to be held in Casino Garden, on Wabash avenue.

ALL READY FOR A RIDE IN THE "SIX-TEEN-SIX."

# INCREASING EFFICIENCY BY USE OF SURPLUS HEAT

By A PACKARD FACTORY EXPERT.

THE gasoline motors of automobiles being heat engines, thermodynamical considerations, other than those of the general principle and method of power generation, are important in the development of such engines toward the goal of high efficiency. It is obvious, in theory, that any use which may be made of waste heat—after it has reached the point at which, in ordinary practice, it dissipates—will tend to increase, indirectly, the number of heat units that are developed by the engine. In practice this holds true so long as, in the utilization of waste heat, there is not added mechanical complication sufficient to overbalance by its own absorption of power the increased efficiency of the heat salvage device.

It might easily be possible to overload an engine with heat-recovering apparatus that would require more power for operation than it would repay in added efficiency. Also, it is possible to complicate to a point where frequent mechanical trouble would offset the advantage of increased efficiency. All these points were carefully studied by the Packard Company in the adoption of heat-saving elements in its motor. There were adopted two ways of utilizing surplus heat—without the addition of working mechanism that would complicate, require additional operating power or interfere with any of the other motor elements. Carburation and lubrication were the selected mediums of heat recovery.

There are several distinct advantages in the heating of a carbureter which independently tend toward greater efficiency of the engine itself in its ordinary method of power development. Probably the most important is that a heated mixture relieves the engine of part of the work of heating the incoming charge up to a temperature necessary to convert it, as a gas, to an ignitable and expansible power agent. This is a certain amount of work that must be done. If it can be done by an exterior and non-power-consuming agent, such as waste heat, the engine itself is saved just that same amount of work and gains just that much in efficiency.

That the apparent theoretical condition is true in practice is shown by comparative tests of cold and warm charges in an engine equipped with a carbureter that may be used either cold or warmed. It will be noticed that, when run cold, there is much more likelihood of and tendency to misfiring than when run warmed, demonstrating that the heated charge furnishes a more readily combustible fuel, and, hence, a more smoothly and efficiently running engine. The same point is proven also by the difficulty generally experienced in starting a motor with cold cylinders, as in winter.

The area of the opening in the aspirating nozzle may be larger in the heated than in the unheated carbureter. This is a factor in the previous advantage of providing a greater volume of fuel to be drawn into the cylinder upon each intake. Furthermore, heating the mixture allows the use of gasoline of grades that would not be available in engines equipped with unheated carbureters. Of course, gasoline of exactly the proper grade is the best fuel in any engine, but there are occasions in automobiling when this cannot be obtained. There is a distinct advantage in a motor which will run efficiently with any grade of gasoline.

So much for the value of heating the carbureter. There is also to be considered the limit to which the heating should be carried and this is an important point. The mixture must not be warmed to excess. If it becomes too hot, it becomes a gas outside of the cylinders, which would be a condition disastrous to both efficiency and smooth running. Taken into the cylinder as a gas, the volume of fuel charge would not be as great as when taken into it as a mist—that is, finely divided gasoline carried in suspension by air. Hence, the exact opposite effect of heating to the proper degree would occur. Compression would be reduced, there would be likelihood of misfiring and surety of decreased ef-

iciency. In adapting waste heat for warming the fuel mixture it is not desirable to apply the heat to that portion of the mixing chamber immediately around the aspirating nozzle. This would warm the raw gasoline before it had become intimately mixed with air. The gasoline would expand and the volume of fuel reaching the cylinder would be less than otherwise. Hence, in designing the Packard carbureter, the heat jacket was placed above the nozzle, so that heat would not be applied to the mixture until it was well on its way to the engine. The bottom of the jacket is about two inches above the tip of the aspirating nozzle and is about five inches high. The butterfly throttle valve is approximately midway of its length. The gasoline-laden air, in rushing past the butterfly valve, is crowded against the wall of the jacketed passage and thus placed in close contact with the heat.

## How the Utilization of Surplus Heat is Effected.

Water shunted from the motor-cooling water system is used as the source of heat. It is taken from the top of a cylinder, where it is warmer than at any other point in its cycle of circulation. Through a  $\frac{3}{8}$ -inch copper pipe it is led to the top of the carbureter jacket. From the bottom of the carbureter jacket there is a straight lead to the suction side of the water pump. This direction of flow is adopted to allow the convenient and positive draining of the carbureter jacket, by simply opening the pump drain.

In the pipe between the cylinder and the carbureter there is a valve, placed close to the cylinder, which allows the water to be entirely shut off from the carbureter, permitting the convenient removal of the carbureter for any desired purpose. It also allows the regulation of the volume of water flowing through the carbureter jacket, as for summer and winter. Such regulation in practice, however, has been found to be hardly desirable, the flow being left practically the same at all times and under all conditions. It is obvious that this heating system does not in any way require motor power for its own maintenance. It is strictly a power recovering system which does not add mechanical complication or new source of trouble to the engine.

The application of surplus heat to the lubricating system of a motor has the single object of rendering the flow of oil surer and always reliable, regardless of changes in temperature. It affects motor efficiency indirectly, by increasing effectiveness of lubrication, which is, of course, an important factor in the smooth running of a gasoline motor.

Cold oil is not easily forced through small pipes. The ordinary exhaust pressure systems of lubrication apply from one to two pounds' pressure per square inch. This will not move oil readily through the oil leads in cold weather. Even in some of the mechanical systems in which a greater pressure is applied, difficulty is experienced with oils in the winter.

Warming the oil can do no possible harm and insures a viscosity which makes it flow readily through small pipes, regardless of exterior temperature conditions. In the use of an oil warming system it has been found that the most severe weather changes have not made any appreciable difference in the operation of the oiling apparatus. The Packard company uses and recommends a certain brand of light oil. The heated lubrication system would, however, allow the use of the heaviest oils, even Albany grease, which would, under the application of heat, become a thin liquid. In fact, such greases have been used successfully in that system. The use of a light oil is for an entirely distinct consideration—that it does not tend to interior carbonization, as do heavy oils.

In Packard practice the benefit of waste heat is secured without cost in power or in consumption of otherwise useful heat or

energy. The oil reservoir is a vertical copper cylinder, which is placed above the motor crankcase close to and between the two pairs of cylinders. All of the other elements of the oiling system are ahead of the dash and under the bonnet, in the warm region surrounding the engine, with the exception of the glycerine-filled sight feeds. The oil is fed to the engine by a positive plunger pump. The direction of flow is from the tank to the pump; from the pump to the sight feeds, and from the sights to the motor crankcase, where it lubricates the various bearings and cylinders by splash.

The tank being directly on top of the crankcase, it is combined with the crankcase vent pipes, this combination and disposition being the subject of letters patent. The vent pipes extend upward through the oil tank, with caps above. They thus assist in the heating of the oil tank, by interiorly applying the heat

value of the crankcase gases that arise through them. The construction also tends toward cleanliness, as the high vent pipes allow the escape of the crankcase gases without that dirty overflow of oil and dirt that is common in the case of low vents. The gases, in rising, have a chance to condense and release oil carried by them, allowing it to flow back into the crankcase. The screw-capped oil tank opening being on top and between the two vent caps, the arrangement gives both accessibility and compactness.

The whole system is a simple unit that avoids complication, the only mechanically-operative part being the one plunger pump, which would be required in any kind of mechanical oil feed. The increased efficiency through heat recovery is obtained simply by disposition and the arrangement of parts. Whatever it adds to efficiency and reliability is a gift. It is not creation of energy. It is thrift in the use of energy.

## COUZENS TALKS ABOUT EXPORT TRADE CONDITIONS

IN spite of his 38 nights on sleeping cars and local steamers which he took in the course of his dash around the Continent, and from which he returned on the *Kaiser Wilhelm der Grosse* last week, James Couzens, former chairman of the American Motor Car Manufacturers' Association, and manager of the Ford Motor Company, looked hale and hearty when seen at the New York branch, during the extremely brief period that he allowed himself in which to tell of the results of his trip abroad.

"There is a fertile field on the other side for the American car," says Mr. Couzens, "but it needs tilling and tilling in the European way. Our methods may be better, but they are not European methods, and to get the business it must be done in their way. There have been comparatively few American cars sent abroad within the past three or four years, and the chief impression of what the American maker can do comes from the few now antiquated specimens that were exported several years ago. The feeling toward American cars is not unfriendly, but in order to obtain a proper foothold the European situation will have to be carefully studied."

As Mr. Couzens visited practically every important city in Europe and covered every Continental country, barring Turkey and Greece, he may be said to have covered the ground pretty thoroughly, so that his views should carry considerable weight.

"Relative to trade conditions I observed," Mr. Couzens said, in answer to an inquiry, "I might say that the very short time spent in each European country, and I visited them all, I had not an opportunity of investigating as closely as desirable the entire trade situation, as my time was devoted very largely to looking after conditions of the Ford in these various countries, and any remarks I make are apt to be based more or less on the experience of our company in these various places and the prospects for the future of our cars there.

"Speaking generally, the prospects for American manufacturers in Europe would appear to be good if they will meet the conditions and requirements of these various countries, but to attempt to do so on the lines on which business is done in America would make it a fruitless task. The American manufacturers, not only in the automobile industry, but in almost all lines of manufacture, have not catered to European requirements and have not given the European business the care and attention it should have, considering the possibilities. The European public are not unfriendly to American goods in general, but they are somewhat unfriendly to American automobiles, due to the many unsatisfactory and unprofitable experiences they have had in importing American small cars during the early days of the automobile industry. Cars of that time, of course, were not nearly as satisfactory as they are to-day, but nevertheless the bad impression was left and no attempt made to correct it. Consequently, the final and only decision that could be reached was that all American cars are practically at the same state of progress even to-day, and that

American makers have made no advances or improvements in construction. It is consequently a difficult task for American makers to correct this impression and convince European buyers that we have improved our product and that it is now equal to any in the world, besides being cheaper, due to our advanced manufacturing methods.

"As to what car will best meet the popular demand," continued Mr. Couzens, "I might say that, at present, there is no demand for automobiles in Europe, as the majority of the makers are overstocked with cars and are exerting strenuous efforts to create a demand for their product. There is no demand for American cars except as you may cultivate it, and it is up to the American manufacturers, if they want the European business, to create and cultivate a demand for whatever product they believe there is the greatest future for. There does not appear to be any particular section of Europe that offers the best inducements to agents, because, from my casual observation, the European industry is practically in the same condition in every country, with the possible exception that Austria-Hungary and the Scandinavian countries may not be as far advanced in the use of automobiles as such countries as Germany, France, Italy, Holland, Belgium, etc. Whatever business is to be had has to be developed. In other words, there is no fruit over there ready to pick, as it has to be cultivated, nursed, and one must wait until it ripens; and the manufacturer who can and will do this will surely pick the fruit, as it will eventually ripen and without undue delay.

"Not being particularly interested in commercial vehicles, I paid little or no attention to their progress, except to note that Germany was making the greatest strides in the manufacture of these cars and was devoting a great deal of time, effort and money toward their development. It is hard to say whether European manufacturers have reached standardization, although to a large degree it would appear as if they had. In fact, it would appear as if they had probably done as much in this direction as American manufacturers, and as to that there is more or less controversy."

While abroad Mr. Couzens visited London, Amsterdam, The Hague, Rotterdam, Antwerp, Brussels, Paris, Barcelona, Madrid, Nice, Monte Carlo, Genoa, Turin, Milan, Rome, Venice, Vienna, Warsaw, Moscow, St. Petersburg, Budapest, Helsingfors, Stockholm, Christiania, Gothenberg, Copenhagen, Hamburg, Berlin, Cologne, Frankfurt, Heidelberg, Karlsruhe, Strassburg, Zurich, Lucerne, Paris and Cherbourg.

He said in many places where there were about a million people there were only 50 automobiles. He secured a record of the number of automobiles in every town in Europe and the number of people able to buy new machines. Probably no man has gone more deeply into the subject. Mr. Couzens called attention to the fact that the exports of American machines now exceeded the importations.

## DOINGS OF ACTIVE AUTOMOBILE CLUBS

### A CALL TO THE BIG NEW JERSEY CLUB.

NEWARK, N. J., Aug. 26.—The *Sunday Call* prints the following: "If the New Jersey Automobile and Motor Club wishes to be of real service to motorists it can undertake no better work than the establishing of roads between Jersey City and Newark that would not be a disgrace to the State.

"New Jersey has been called 'foreign territory' by motorists of other States. This has been not so much because of legal conditions, nor yet of any refusal to allow her roads to be torn up by a Vanderbilt cup contest, but for the reason that no good thoroughfares lead from the metropolis of this State to New York, the center of automobile activity in America.

"No motorist who has attempted to drive his car at more than snail's pace across the prehistoric Plank road or the dusty and rutty Turnpike will deny that conditions are disgraceful.

"New Jersey's largest motor club has done much for automobilizing, yet it is doubtful if working on the law or running endurance contests, valuable as are these evidences of activity, ever brought such great benefit as would come through the repairing and oiling of the Turnpike or, better yet, the proper surfacing of the thoroughfare leading from the heart of the city—the Plank road.

"Much is said concerning the poor state of repair of some of our country roads, yet their condition is ideal compared to the trails across the Hackensack meadows. A great opportunity awaits the New Jersey organization."

### OUQUAGA CUP TOUR IN SEPTEMBER.

BINGHAMTON, N. Y., Aug. 26.—At the annual meeting of the Binghamton Automobile Club, held last week, the route for the Ouquaga cup tour was decided upon and the date fixed for the third week in September. From this city the tour will extend to Owego, Cortland, Syracuse, Auburn, Geneva, Rochester, Buffalo, Niagara Falls, Bath, Danville, Elmira and back to Binghamton. The distance is about 550 miles.

The annual election of officers resulted in the election of Benjamin F. Welden as president; William G. Faatz, vice-president, and S. M. Frechie, secretary-treasurer. The matter of a clubhouse was informally discussed at a banquet after the meeting, and the project will come up later for official consideration.

### MIDDLEBORO CLUB GIVES PUBLIC WARNING.

MIDDLEBORO, MASS., Aug. 26.—With a view of aiding in the enforcement of the local ordinance, recently put in force by the Selectmen and which limits the speed through the town to twelve miles an hour, the club adopted a novel scheme. A number of men were provided with red flags and a supply of cards setting forth the object of the club and giving all the required information. These were handed to the driver of every car entering the city on the main roads, the red flag playing an important part in the proceedings. The work was kept up all day long, and the officers of the club feel that it went a long way toward accomplishing the object desired.

### PEORIA, ILL., HAS ANOTHER AUTOMOBILE CLUB.

PEORIA, ILL., Aug. 26.—Twenty-seven owners of Glide automobiles have formed the Glide Automobile Club, with the following officers: President, M. E. Magruder; vice-president, A. C. Berkstresser; secretary, A. Y. Bartholemew; treasurer, E. P. Churchhill. A club run to Mossville, with a chicken supper as an inducement, is scheduled for Saturday next. A fortnight from the same day there will be a run to Lake Senschwine, spending the night at the Under Cliff Hotel and returning the following day, Sunday, September 14.

### QUAKERS FIND POSTPONEMENT ADVISABLE.

PHILADELPHIA, Aug. 26.—Members of the Contest Committee of the Quaker City Motor Club, which is promoting a race meet at Point Breeze Track, are up in arms at the promiscuous manner in which the A. A. A. grants conflicting sanctions. Having originally selected Saturday, August 31, that date was abandoned and a sanction secured for the following Saturday, September 7. When the Quakers learned later that Morris Park had been granted a sanction for the same date, and realizing that they could get few New York entries if they held on to the 7th, they reluctantly announced another postponement, this time to the 14th. "Surely," said one of the Quaker Motor Club officials, "those who control racing should see to it that the holder of a sanction should be free from competition, and two permits should not be issued for the same day in cities as close together as are Philadelphia and New York. We count on quite a number of entries from the metropolis, and of course we can't get them with a meeting running there on the same day. There is nothing left for us to do but postpone."

### GRAND RAPIDS TO ENTERTAIN CHICAGOANS.

GRAND RAPIDS, MICH., Aug. 26.—Correspondence between the local automobile club and the Chicago Automobile Club has resulted in the decision of the latter club to make Grand Rapids its objective point in its next endurance run, which will come off later this month or early in September. Dr. D. Emmet Welsh, secretary of the Grand Rapids Automobile Club, has sent Assistant Secretary W. W. Crawford, of the Chicago club, revised maps of the route, and the run will be made by way of South Bend, Elkhart, Three Rivers and Kalamazoo to this city. The city is expecting the largest gathering of strange automobiles that has ever been within its limits.

The club has been so successful this year in its new country home at Cascade, and has grown so rapidly, adding fully 200 new members this year, that negotiations are on foot now for the purchase of the Cascade Springs Hotel, to be fitted up for a new abode.

### COLORADO CLUB PLANS COUNTY ORGANIZATION.

CANON CITY, COLO., Aug. 23.—With a view to perfecting an organization comprised of all the autoists in the county, a special meeting of the Cañon City Automobile Club was called on Thursday of last week, and was held at Miller's Roof Garden. Unfortunately, threatening weather prevented as large an attendance as had been anticipated, as invitations had been issued to autoists in Florence and Portland, as well as the coal camps, Dr. J. W. Cline, of Florence, being the only one to represent his town. A committee consisting of Dr. Cline, Colonel J. Q. MacDonald and J. J. Armstrong was appointed to lay the matter of a county organization before the automobile owners of Florence, and there is little doubt but that they will unite with the local club in the proposed movement. The principal object sought is the improvement of the county roads.

### DETROIT'S CLUB UNUSUALLY PROSPEROUS.

DETROIT, MICH., Aug. 26.—President Harry Skillman and his assistants in the Detroit Automobile Club are indefatigable workers, and under their regime the club is prospering to a gratifying degree, its present membership reaching 300, of whom more than 50 have been added during the past half year. Not the least of the attractions offered by the club is its country home at Pine Lake, about thirty miles from the city. Many improvements have been made, new furnishings installed and facilities provided in other ways to take care of the rapidly increasing membership, so

it is doubtful if there is a better equipped club anywhere in the State or, for that matter, a more complete country home of the kind in the United States.

#### KANSAS AUTO CLUBS GROWING FAST.

SALINA, KAN., Aug. 23.—The number of Kansas automobile clubs was augmented by one with the organization of the Salina Automobile Club here a few days ago, with a charter membership of twenty-four autoists. It is hoped to increase the membership to fifty within a week or two, and an effort will be made to secure the State motor convention for this city in 1908. The officers of the new club are H. D. Lee, president, and Senator Fred A. Quincy, George Wergerbur, Leon Rash and H. L. Center were appointed an executive committee, the nomination and election of the remaining officers being deferred until a little later, when there is every prospect that the new organization will include on its roll all those interested in automobiling in this section.

#### VIRGINIA VALLEY TO BE SCENE OF TOUR.

NORFOLK, VA., Aug. 26.—One of the most ambitious tours ever undertaken by a Southern automobile club is now under consideration by the Tidewater Automobile Association of this city. It is proposed to leave here the early part of September and

MRS. S. W. M. HARRIS, VIRGINIA'S PIONEER WOMAN AUTOIST.

spend ten days or two weeks on a trip up the Valley of Virginia. A committee is now studying the nature of the country and the accommodations afforded in order to make up the itinerary. "We all propose to keep within hailing distance of each other," says a member of the committee, "and it may be stated there will be no scorching or anything of that sort, calculated to bring us into disfavor with folk along the route."

#### BUFFALO WILL CELEBRATE OLD HOME WEEK.

BUFFALO, Aug. 25.—Never in the history of automobile parades have so many prizes been offered as will be given for the decorated and illuminated parade under the auspices of the Automobile Club of Buffalo, to be held Tuesday evening, September 3, during Old Home Week, in this city. Secretary Dai H. Lewis has already purchased twenty-three silver cups for the best decorated cars. There is every prospect of making the affair one to be long remembered.

#### OREGON DEMANDS LEGAL TEST FOR DRIVERS.

PORTLAND, ORE., Aug. 22.—The Portland Automobile Club has put itself on record as favoring rigid examinations for professional chauffeurs before the latter are allowed to follow their vocation. In addition to favoring legislation on this important subject, the club also asks that children under 18 years of age be prohibited from operating automobiles in the streets.

## THE AUTOMOBILE CALENDAR.

### AMERICAN.

#### Shows and Meetings.

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.
- Nov. 2-9.....—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.
- Nov. 29-Dec. 6.—Chicago, Casino Garden, Second Annual Auto Parts Show. A. M. Andrews, Secretary, 184 La Salle Street.
- Nov. 30-Dec. 7.—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 14-21.....—St. Louis, Mo., New Coliseum, Second Annual Auto Show, St. Louis Automobile Manufacturers' and Dealers' Association.
- Dec. 28-Jan. 4.—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.
- April 6-11.....—Buffalo, Convention Hall, Motor Boat and Sportsman's Show. D. H. Lewis, manager.

#### Races, Hill-Climbs, Etc.

- Sept. 2.....—Wildwood, N. J., Straightaway Race Meet, Motor Club of Wildwood.
- Sept. 5.....—Chicago, Cedar Lake Economy Run, Chicago Motor Club and Chicago Automobile Trade Ass'n.
- Sept. 6-7.....—New York City, Morris Park Track, 24-Hour Race Meet. Morris Park Motordrome Club, office, Times Building.
- Sept. 7.....—Hartford, Conn., Hill Climb, under the auspices of the Automobile Club of Hartford.
- Sept. 7.....—Minneapolis, Minn., State Fair Race Meet of the Minnesota State Automobile Association.
- Sept. 9-10.....—Pittsburg, Pa., Brunot's Island Track, Race Meet, Automobile Club of Pittsburg.
- Sept. 14.....—Philadelphia, Point Breeze Track, Quaker City Motor Club.
- Sept. 14.....—Jamestown (Va.) Exposition, Aeroplane Contest for "Scientific American" Prize.
- Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.
- Sept. 20.....—Milwaukee, Wis., State Fair Grounds Track, Race Meet, Milwaukee Automobile Club and Milwaukee Dealers' Association.
- Sept. 21.....—Harrisburg, Pa., Middletown Track, Race Meet, Motor Club of Harrisburg.
- Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

### FOREIGN.

#### Shows.

- Aug. 1-Sept. 30.—Holland, Amsterdam, International Exhibition of Motors and Machines, Palace of Industry.
- Sept. 28-Oct. 7.—Denmark, Copenhagen International Automobile Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1.—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.
- Jan. 18-Feb. 2.—Turin, Italy, Fifth International Automobile Exposition, Palace of Fine Arts, Valentino Park, Automobile Club of Turin.

#### Races, Hill-Climbs, Etc.

- Aug. 23.....—Belgium, Ostend Motor Boat Meeting.
- Sept. 1-2.....—Italy, Brescia Circuit, Florio Cup. A. C. of Italy.
- Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.
- Sept. 15.....—France, Chateau-Tbierry Hill Climb.
- Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.
- Oct. 20.....—France, Gaillon Hill Climb.
- Nov. 1-15.....—France, Voiturette Contest near Paris.
- May 16, 1908....—Sicily, Targo Florio, Automobile Club of Italy.
- June 20-July 5, 1908.—Grand Prix, Dieppe Circuit, Automobile Club of France. (Exact date to be announced.)
- July 14, 1908....—Paris to London, Aerial Race.

## BAY STATERS OF A. A. A. ACTIVE AND PROGRESSIVE

BOSTON, Aug. 24.—In its sign-board campaign, the Legislative Committee of the Massachusetts State Automobile Association has just made an important step forward. This is the permission which has been secured from the New England Telephone and Telegraph Company for the erection of the cautionary road signs of the association upon the poles of the company throughout the State. The telephone company has heretofore been very conservative about allowing the use of its poles for any purposes except those of the company, but Chairman Lewis R. Speare, of the Legislative Committee, was able to bring to bear upon officers of the company arguments which brought about the desired concession. The committee, through the constituent clubs of the association, will soon begin the erection of these signs, and it is planned to post the principal roads of the commonwealth as rapidly as possible. The signs will be uniform in style and will bear the warning, "Drive Carefully," followed by a notice of the road conditions ahead. The signs will be posted at dangerous curves, cross-roads and the like, and it is thought that drivers will pay more attention to warnings posted by the State association than they do to those of local authorities.

The arrangements for the convention of the State association, to be held September 6 to 9, at Hotel Wentworth, Newcastle, N. H., are making good progress, and the gathering bids fair to be one of the largest of New England automobilists ever brought together. The programme includes club runs on Friday, with an entertainment in the evening; a baseball game between teams representing two of the leading clubs Saturday afternoon, and a general business meeting in the evening, at which the Hon. Samuel L. Powers, formerly a Massachusetts Congressman, will make an address. Sunday there will be a short run and a clam-bake, and for Monday the hotel management has provided a gymkhana tournament for owners of cars.

Besides the pleasure side of the convention, the committee in charge hopes to make the gathering important in a business way. There will be meetings of the officers and committees of the various

clubs, at which current problems in automobiling will be discussed. Proposed legislation will come up, and the policy of the automobilists for the next session of the General Court will undoubtedly be outlined. One subject that has been set for discussion is the so-called "light" bill, to compel all vehicles on the roads at night to carry lights of some sort. This bill has been side-tracked by several legislatures, but the automobilists probably will make a determined effort to have it put through next winter when the legislature reconvenes.

The committee in charge of the convention consists of Lewis R. Speare, of the Bay State Association; Elliot C. Lee, of the Massachusetts club; J. P. Coughlin, of the Worcester club; S. L. Haynes, of the Springfield club; W. H. Chase, of the Wachussetts club; H. R. Burbeck, of the Brockton club, and A. E. Bliss, of the Malden club.

### THE CONGRESS ON UNIFORM LAWS.

President William H. Hotchkiss, of the American Automobile Association, and Chairman Charles Thaddeus Terry, of the Legislative Board, were in attendance at the recent Congress on Uniform Laws, held at Portland, Me. The first three days of the session last week were devoted to a consideration of the reports of the various committees, and those accepted or modified were this week considered by the Congress at its joint session with the American Bar Association. The Congress is made up of commissioners appointed by the governors of the different States. Mr. Terry has been one of the three commissioners from New York State for some time past, and recently Mr. Hotchkiss was appointed by Governor Hughes to fill a vacancy.

While not much was done on the subject of automobile laws at the session, it is a certainty that much attention will be paid to uniforming these laws at the next session of the Congress.

## FOREIGN IMPRESSIONS OF AN AMERICAN TOURIST

SAN FRANCISCO, CAL., Aug. 20.—G. A. Hensley, a well-known San Francisco autoist, has just returned home from an extended tour in Europe, where he drove his White steamer several thousand miles. Mr. Hensley had some most interesting experiences. The tour started in February of this year at London, from where the tourist went to Havre and then to Paris. "I wish I had crossed the Channel in my auto," jokingly remarked the autoist; "if I had, I wouldn't have been seasick."

From France he traveled through Spain. Speaking of King Alphonso's realm, Mr. Hensley said it was, without excepting the Alps, the coldest, most desolate, God-forsaken and degenerate country he ever saw. "Certain of the peasantry are so ignorant regarding the general appearance of an automobile that, from their actions, it seems they think some fierce animal is upon them. In many cases they run and never look back, and in one instance two peasant women endeavored to climb the same tree. We met with such road experiences all through Spain, and especially along the highway between Burgos and Madrid, known as the Upper Castile road, was traveling very arduous, owing to the roads being congested with mules, oxen and peasantry, most of whom had never seen an auto before. On our appearance they were thrown into indescribable confusion." In Granada, Spain, over half of the population are beggars, according to Mr. Hensley, who is of the belief that some of them really cut off their arms and otherwise disfigure themselves to get money.

From Spain he toured to Marseilles, Nice, to Monte Carlo, and

then through Italy to Milan. From Milan he went to Venice. The local autoist crossed the Alps in the teeth of a blinding snowstorm to enter Austria. Driving under these conditions, with snow at times up to the hubs, was very difficult.

Mr. Hensley made two tours in Germany. Perhaps one of his most successful pournes while touring on the Continent was a trip up the Rhine and across Germany, covering a distance of 350 miles in a day's run.

"My one regret in connection with my tour abroad was that I did not take a chauffeur from this country, instead of being obliged to depend upon the European article. I was rather unfortunate in my selection of an English driver, and the one I engaged succeeded in having three accidents in one week with my car.

"With the exception of London, where there are a great many Whites in use, the steam auto attracts unusual attention. Many cannot realize how so large a machine is able to tour the country without restoring, the majority of opinions among those unfamiliar with steamers being that my car was an electric. This impression was created through the noiselessness in the running of the car.

"The general attitude abroad toward American cars (this does not apply to the steamer) is one of contempt. Yet I visited most of the largest automobile factories in Europe and noticed that about one-half of the machinery, like the gear-cutting and other appliances, are of Yankee production."

**Status of the Six-cylinder Car for 1908.**

Whatever may be the arguments pro and con where the six-cylinder car is concerned, whether from a strictly technical point of view, or from that of the user who seeks utility alone, there is one thing certain, and that is many of this country's most prominent makers will at least have a go at it for next season. This became evident some time ago, and, in the natural course of events, no other outcome was to be expected. There has been so much talk about the six-cylinder car and its obvious advantages that the automobile-buying public has become infected with the idea. Consequently, it seems reasonably certain that there will be a very greatly increased demand for this type of car during the coming season, and, with that foresight that usually characterizes him in such matters, the American manufacturer is preparing to reap the harvest.

The successful experience of the few pioneer makers in this country who have built cars of this class for the past two years has served to demonstrate that there is a large business to be done in this field. Hence, many manufacturers have made preparations accordingly, and the fact that they regard six cylinders as superior to four, from either a manufacturing or an engineering point of view, has little or no bearing on the matter. There is a demand for an increased number of cylinders, and there is every prospect that it will assume large proportions in the near future, and the average maker is willing to meet it.

**Why Special Types of Cars Are Difficult to Market.** That it is one thing to evolve a radically different type of automobile and quite another to sell it is something that the average inventor finds hard to realize. Regardless of the numerous meritorious features it may embody from an engineering point of view, it is generally a very difficult matter to find a sufficient number of purchasers for it to warrant its manufacture. But little observation is required to understand the reasons therefor. The autoist who becomes the owner of such a machine finds himself compelled to master it from beginning to end, either without assistance or with what the maker will extend. If he breaks down on the road it is usually useless for him to appeal to drivers of passing cars, for no matter how willing the latter may be to aid him they are frequently helpless.

He must, indeed, be firm to his purpose and unswervingly enthusiastic in his liking of the machine to continue as its advocate, for neither among autoists as a class, nor in the journals devoted to automobiling, does he find any reference to the problems that confront him. In short, he is in a class by himself, and even though converts of his own kind may be comparatively numerous, they are too widely scattered to be of any mutual help to one another. The autoist who will remain faithful under such circumstances is a rarity, usually with some well-set mechanical ideas of his own, so that it is not difficult to understand why revolutionary designs are not enduring.

**Why Should Cost of Selling Autos Be So High?**

Given machinery of any other nature, whether of a special class or not, and of the same value as the average modern automobile, and it is safe to say that it does not cost a fraction as much to place it in the hands of the purchaser. It is a matter of common knowledge that a certain, and not particularly small, section of the selling end of the automobile industry has been characterized by an amount of profligacy and extravagance that have brought opprobrium on the business as a whole. It goes without saying that the taint has not been general by any means, but, nevertheless, it costs far more to dispose of a \$5,000 automobile than it does to sell \$5,000 worth of machinery, whether for printing, laundry work, or manufacturing of any kind.

All of which merely goes to show that the business of selling automobiles is still on a very artificial basis, and it must be admitted that the immediate future offers no prospect of betterment, which, however, must come sooner or later. It is plain to be seen that things must inevitably tend that way as a natural result of increasing competition. The great cost of marketing automobiles is one of the things that contribute very largely to make the "poor man's automobile" a dream of the future, but the placing of the business on a sound economic basis will bring its realization far nearer.

**Awakening of the Agriculturist to Auto's Benefits.**

At last is the farmer coming to a realization of the fact that the automobile benefits rather than injures him. In fact, he may be said to have awakened, if the significant action of the Farmers' Union of Floyd County, Ga., may be taken as a criterion. More severely restrictive measures than have ever been seriously countenanced in other States have been pending before the Georgia Legislature, and this body of farmers has gone on record as opposed to any legislation prohibiting automobiles from running on Georgia highways, on the ground that *no factor has been or will be so important in the development of good roads as the automobile.* It has come at last, though a long while on the way. The excellent example thus afforded may well be patterned after by other farming communities.

It may be that there are several American makers who have the idea in mind, but it is known that one has conceived something which will cause the farmer to sit up and take notice when the farm utility car appears.

## A. A. A. AND ITS CONDUCT OF AUTO RACING

**A**UTOMOBILE racing unquestionably is one the most difficult forms of competition to govern in a manner satisfactory to all concerned—in fact, it can never be controlled in such way as to please all participants. It is commercial sport, wherein the winner profits by victory and the defeated sometimes suffers a loss of prestige. Whatever organization looks after automobile racing, it will receive a generous amount of criticism and a sparse quantity of commendation. This is inevitable, and the officers of the American Automobile Association are keenly aware of the fact. Nevertheless, it is the impression of the majority that this national organization is the proper body to look after the sport, in addition to its other important work, and the foisting of it to other control would be looked upon as a confession of weakness and inability to cope with the complicated situation.

No rules will ever be framed, according to a consensus of opinion of the experts, which will be entirely to the liking of all contestants, and it ever must be a case of agreeing upon something acceptable to the majority. In the drafting of these rules the A. A. A. Racing Board has always considered the advice of its technical advisors, who represent the three big bodies of automobile manufacturers in this country, with a fourth member from France. Relying upon these four experts is the policy of Chairman Jefferson de Mont Thompson, and the four selected were named because of their prominence and experience in automobile racing. There can be no objection whatever to a thorough discussion of the racing rules at any time, and there is no reason whatever why the A. A. A. Racing Board should hesitate to formulate regulations meeting the desires of the greatest number of manufacturers. Much has appeared in print of late, and below are given some of the most recent developments in the situation.

### RACING BOARD CONTAINS MEMBERS NATIONAL TRADE BODIES

By A. R. PARDINGTON, ACTING CHAIRMAN A. A. A. RACING BOARD.

**I**N organizing the Racing Board, the idea of representing all interests was carefully considered. The fact that the Vanderbilt Cup race has been conducted for three years past in a manner satisfactory to the international participants speaks for the general efficiency of the Board, which, of course, practically composes the Cup Commission. It is a source of keen disappointment that the commission found its promising efforts for the holding of a 1907 race interfered with by opposition from a most unexpected source. Those occupying official positions in any organization are at times subjected to outbursts of unjust and biased criticism, their acts being purposely distorted, often by interested persons who have axes to grind. But when the entire facts are generally understood in connection with the inability to conduct a 1907 Cup race, there will be a change of sentiment among the few misled by untruthful assertions and insinuations.

The Racing Board contains experienced amateur automobilists and also representatives of all the national automobile manufacturing associations: E. R. Thomas, N. A. A. M.; A. L. Riker, A. L. A. M., and Henry Ford, A. M. C. M. A. In addition France supplies a member, J. J. Mann, of the Automobile Club of France, which is composed for the most part and is controlled by the makers of that country.

The publicity which has been given recently to automobile race meets conducted in several cities under the auspices of the local automobile clubs affiliated with the American Automobile Association has contained much that was not authentic or reliable.

In a score of meets held, only two regular protests have been received by the Racing Board. One of these came from the Automobile Club of St. Paul, Minn., and the other was a complaint of a Brighton Beach entrant that he had not received a prize. The acting chairman has given prompt consideration to these and other minor complaints and has been conducting private investigations of the charges preferred, which, together

with other reports, will be presented at a meeting of the executive committee of the Racing Board, to be held in New York, Thursday, August 29.

The Racing Board received and granted a series of sanctions to the United States Motor Racing Association upon the recommendation of automobile clubs which had entered into agreements with this racing association to promote and conduct endurance contests in their respective localities, including sanctions at Chicago for a meet under the auspices of the Chicago Automobile Club and a meet at Brighton Beach under the direction of the Long Island Automobile Club of Brooklyn.

It is a well known fact that both the Chicago and Long Island Automobile Clubs were among the pioneers in the American Automobile Association, and have in the past conducted many successful contests both on track and road.

It has been the custom of the Racing Board to grant sanctions requested by any club affiliated with the American Automobile Association without the investigation which is always given to a sanction request not coming through the affiliated clubs of the association, the Racing Board believing that the association clubs should be fully able to supply capable officials. If the officers of meets fail to conduct such meets properly, it is a matter for the club to investigate and report to the Racing Board for consideration.

The acting chairman, pending a meeting of the Racing Board, has cancelled all requests for reservations made by the United States Motor Racing Association and other independent promoters. At its meeting to be held Thursday the Board will consider the question of the penalty to be imposed upon the United States Motor Racing Association and other independent promoters for failure to comply with the rules of the association, or for failure to make awards incident to successful competition. This suspension will apply to the individuals of these promoting associations as well as to the organizations themselves.

### A. L. A. M. UNABLE TO FORMULATE SATISFACTORY RULES

**I**N an interview Monday last, E. H. Cutler, general manager of the Association of Licensed Automobile Manufacturers, said he was of the opinion that the present rules for conducting the various events throughout the country were inadequate to get the best results, both for the industry and for the general public. When pressed for a solution, Mr. Cutler admitted that a manufacturers' committee had, after many trials and after working over them three or four months, been unable to form a set

of rules that would meet all the requirements necessary for a thorough and honest tour or race.

Mr. Cutler was of the opinion that the adoption of universal horsepower rating was the remedy for the existing evils, and he advocated that the engineers of the Association of Licensed Automobile Manufacturers, the Society of Automobile Engineers and the American Motor Car Manufacturers' Association unite in recommending the adoption of a universal horsepower rating,

such as was being used, perhaps, by the A. L. A. M. "The adoption of this formula," says an A. L. A. M. press sheet, "would be the first step toward reorganization of competitive rules and would be the basis for all classification of cars in any of the events that will take place. As the situation now stands, it did not seem fair either to the manufacturers or to the public that a 12-horsepower car costing \$1,500 should be required to do the same amount of work as a 60-horsepower sell-

ing for \$5,000. Under the present rules there is no provision made for classification and many instances can be cited where reclassification is absolutely necessary. It is hoped that Mr. Cutler's recommendation to the engineers will meet with ready response from the engineers of the other organizations, for, after all, it is the engineer who really knows the merits of the car and is in a position to arrange for classification in a manner which will give entire satisfaction to all."

## WHERE MUCH CRITICISM OF THE A. A. A. COMES FROM

By JOHN C. WETMORE, IN THE NEW YORK EVENING MAIL.

THE American Automobile Association, as the national organization, is, of course, in the nature of things, open to criticism as well as praise. This is a country of free speech and a free press. Individuals have a right to wag tongues just the same as writers are free to wield pens. An organization that represents any one class must stand for criticism as well as praise and take the bitter with the sweet.

There has been a lot of criticism of the A. A. A. of late. It were better, however, did it come from well meaning friends instead of from enemies, whose attacks have no sincere information of conditions in view. Most of the criticism, however, comes from two sources. The reasons behind their attacks are very well known. In one case the attacks have their foundation in disappointed personal ambition and personal prejudice against a trusted A. A. A. leader and adviser, and the other from the failure of the "man behind the gun" to induce the national organization to lend itself to a business advertising scheme.

It was only to be expected that a coterie of importers would readily lend itself to the purposes of the foremost journalistic exponent of foreign as against American cars, especially since that purpose was an attack on a national organization confessedly a backer of the home product. It was, however, a bit surprising that several prominent local exploiters of American cars should have allowed themselves to be quoted as joining any hue and cry having in view the destruction of a national organization which is making honest effort to build up the sport and industry.

As R. H. Johnston put it at the Moore dinner, the A. A. A. needs correction from the inside. Reform, however, should be striven for by men as friends and not as enemies of an organization at last pretty nearly national and trying to become altogether so by the establishment of an individual membership.

Now that we are on the eve of a popular vogue for track racing there is need for new and revised rules. The Importers' salon makes a timely suggestion that a standard formula for rating horsepower be adopted. The criticism that horsepower classification on the mere say-so of makers, dealers and entrants is ridiculous and unfair is just. Sufferers like Roberts should be protected by a rule making clubs responsible for the prizes at meets to which the clubs give the sanction of their names. A lot of other changes, amendments and reforms in the rules and conduct of automobile racing are needed, and can be secured without the disruption of so potent, useful and sincere a body as the present national organization.

The only suggestion for a substitute advanced by those advocating the pulling down of the A. A. A. is the raising of the A. C. A. to that position. The clubs and motorists of the country would never stand for a purely local club, no matter how strong its claims to pioneership, size and wealth, being put at the head of the automobile affairs of the whole country.

The Racing Board has a lot of work ahead of it. It should listen to the suggestions of the friends of the national organization. The criticisms of its enemies need not be considered.

## SITUATION HUMOROUSLY BUT SENSIBLY SIZED UP

By HENRY CALDWELL, IN THE NEW YORK EVENING TELEGRAM.

THERE is a lot of absurd talk about a new national association to govern racing. The talk is of combining the Licensed Association, the Independent Makers, the Importers' Association and the A. C. A., with the A. A. A. left out.

"Can you imagine," said a wealthy Flat-Tire to-day, "of a greater lot of pin-head rot than this? Picture the licensed makers and the independents (the Patrick Henrys, as they are called in polite motor circles) coming together in anything unless it was a dark room with drawn cleavers. Also try to figure out how either one of these two, particularly the Patrick Henry Association, which is purely a domestic car promoting body, could ever agree to racing rules which would suit the importing agents. Then just consider the Automobile Club of America harnessed up to three trade associations to promote racing, the very thing

it is trying, and very sensibly, too, to kill. Why, as much as we all criticize the Foolish Three A's, this new proposition looks like a scream to me. The idea of a race promoted by the men who make the cars, every car different and every man's car the best.

"I agree that the A. A. A. should be arrested for obtaining money under false pretenses, but it is far ahead of such a scheme as this new one.

"Let the makers refuse to support it and it will die. But never let the makers try to run races themselves. If there is one thing the wise maker keeps away from to-day it is all manner of racing. The expense is killing to him, and if he meddles in it he kills the sport of it for the amateur. No, the frail young zephyr who conceived this idea needs a vacation in the Frayer-Miller mountains.

### MORRIS PARK'S TWENTY-FOUR HOUR RACE.

Entry blanks are out for the opening meet of the Morris Park Motordrome Club, September 6 and 7. Five teams for the 24-hour relay race quickly signified their intention of competing. The 50-mile and other races will also be well filled, according to reports received at the office of the racing secretary, No. 31 West Forty-second street, New York City. Plans are now under way for lighting the track during the night hours with searchlights, as is done at the Brooklands track in England and at the famous two-mile track in Berlin.

The long race will be reported to the public by an enormous blackboard, similar to what has been used at Vanderbilt Cup races.

### PLANTIFF REPUDIATES "HERALD" INTERVIEW.

Gaston Plantiff, manager of the New York Ford branch, emphatically denies the interview accredited to him in the New York *Herald* of Sunday last, wherein he is quoted as saying: "As at present conducted, automobile racing and touring events are a disgrace to this country and harmful to the industry." With Henry Ford one of the technical advisers of the A. A. A. Racing Board, it can be easily understood that Mr. Plantiff objects to having the above opinion and other remarks of a similar sort foisted upon him to bolster up an attack on the A. A. A., led by the automobile editor of the *Herald*, who has an old personal grievance.

**APPERSONS DISCONTINUE BRANCH HOUSES.**

George H. Strout, sales manager of the Apperson Bros. Automobile Company, of Kokomo, Ind., was in New York last Saturday and placed the Apperson line for 1908 with the Sidney B. Bowman Automobile Company, 225 West Forty-ninth street. The New York branch of the Apperson Company will be closed on September 1. This is in accordance with the new policy adopted by the company, which contemplates the closing of all branch houses and the marketing of its product through regularly appointed Apperson dealers.

The Chicago branch will be discontinued October 1 and the Apperson line in that city will be handled by Joseph Gunther, one of the best known men in the trade there and the president of the Chicago Automobile Trade Association.

The Apperson company is bringing out two new models for 1908, and the complete line will include the following cars: 50-55-horsepower touring car, fully equipped, including top, \$4,200; 30-35-horsepower four-passenger runabout, with double ignition system, \$2,750; "Jackrabbit" 50-55-horsepower runabout, guaranteed speed 75 miles an hour, \$5,000; six-cylinder 50-55-horsepower touring car, \$5,000.

**FIRESTONE COMPANY RE-ELECTS OFFICERS.**

AKRON, O., Aug. 26.—At the annual meeting of the stockholders of the Firestone Tire and Rubber Company, held Wednesday, August 21, the old board of directors was elected as follows: H. S. Firestone, Will Christey, R. J. Firestone and A. C. Miller, of Akron, and L. B. Sisler of Port Huron, Mich. The directors at their meeting chose the following executive board of officers: President and general manager, H. S. Firestone; secretary, S. G. Carkhuff; treasurer, L. B. Sisler; assistant treasurer, Frank R. Talbott. The last is a newly-created office, Mr. Talbott having been cashier of the company for some time past. The annual report of the officers showed an increase in sales of 60 per cent. over the previous year, the statement being the best ever put out by the company.

Arrangements are being made by the company to make a second large addition to the plant, besides the one now half completed. This second addition is to be constructed of brick and to be three stories high.

**THE WOLVERINE CAR THAT HAD A BATH.**

GRAND RAPIDS, MICH., Aug. 26.—A. C. Menges, who with his gas engine man and a Chicago automobile expert, leaped the gap of the open drawbridge of the Calumet river at Ninety-second street in Chicago, recently, with the new car which he had just built, has returned to the city. In spite of the fact that the Chicago papers said that his car when removed from the river was a mass of scrap iron, he had it ready for use the same night it was taken from the stream and the next day started on the run home. The only damage done to the car was the complete wrecking of the body, and the breaking of the handle of the steering wheel. With an eye to advertising a little the endurance of his car, Mr. Menges decorated it with a sign announcing its unusual experience of leaping fifty feet to the bottom of a river, and has kept the sign on the machine during its later travels. Menges secured a very prompt settlement with the city of Chicago for the damage to his car.

**WHEELS TURN IN MAXWELL INDIANA PLANT.**

NEW CASTLE, IND., Aug. 24.—At 8:55 A. M., August 13, the wheels of the mammoth factory of the Maxwell-Briscoe Motor Company began to turn. Three short months ago Vice-President Fairbanks officiated at the corner-stone ceremony, but during this short interval the building has been equipped and finished. Last March, J. D. Maxwell prophesied that this plant would be turning out automobiles before the time snow flies. There was little then to justify the promise, but time has shown its fulfillment.

**MICHELIN OFFERS FRENCH ROAD BOOK FREE.**

Automobilists contemplating a tour through France will find a useful volume in the 700-page Michelin guide to France, published by the well-known firm of tire manufacturers. Copies of this book are kept in stock at the offices of THE AUTOMOBILE, Fuller Building, New York City, for disposal, free of cost, to those of our readers who may have need of them. The volume will be sent to any address in the United States on receipt of 10 cents in stamps to cover cost of mailing. The Guide Michelin, 1907, printed in French, and now in its eighth year, is accepted as one of the most complete automobile guide books to France. Its important features are sketch maps of every town in France, road distances, places of interest, police and customs regulations, about thirty colored road maps of sections of the country, and one complete colored road map of the whole of France.

**WHITE OPENS MODEL GARAGE AT BOSTON.**

BOSTON, MASS., Aug. 25.—The new \$15,000 six-story fireproof garage just opened here at 341-343 Newbury street by the White Steamer Company of Cleveland gives to that firm one of the finest establishments of its kind to be found in New England. The new premises, which will accommodate 200 White steamers, have a 62-foot frontage and are 100 feet in height. All the floors are given over to storage with the exception of the third, which has been leased to the Boston Y. M. C. A. to be used as an automobile and electrical school.

Fireproof throughout, each floor is without a post and all appointments are of the highest class. Two fast electrically operated elevators run from the basement to the top floor, one taking all ascending and the other all descending cars. The washstands, conveniently located on the first floor, are capable of handling three cars at a time. The appointments of the chauffeurs' room on the second floor comprise individual steel lockers, a pool table, barber service and shower baths. The establishment will be opened September 3, in charge of Manager J. C. Hathaway.

THE WHITE COMPANY'S NEW BOSTON GARAGE.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Marvel Automobile Co., one of the lately-organized manufacturers of Detroit, and makers of the small run-about of that name, has been petitioned into bankruptcy upon the petition of several creditors, whose claims aggregate \$2,457,76. The company was capitalized at \$50,000.

Edward Spring, president of the Huber Automobile Co., of Detroit, Mich., has filed a petition in the Circuit Court asking for the appointment of a receiver for the company on the ground of insolvency. The company was incorporated in 1903 with a capital stock of \$100,000 to manufacture automobiles, but of late has been operating autos for hire.

Announcement of the 1908 line of Lozier cars will be made September 1, and it is said will contain much of interest to the automobiling public. The prominent standing which the Lozier product has achieved in the trade, and the fact that Lozier cars embody features distinctly their own, justifies the claim of the makers that the forthcoming announcement will be looked forward to with considerable interest.

Edward B., William J. and John L. Corcoran, who were formerly connected with the Corcoran Lamp Co., of Cincinnati, have withdrawn from that concern and will manufacture automobile lamps under the name of the Victor Lamp Co. A long lease has been secured on the new building, located at 1249 Plum street, Cincinnati, that was built especially for the new house, and a complete new outfit of modern machinery is being installed.

Pittsfield, Mass., is the latest town to change its speed laws as a result of a visit of the giant Warner autometer, and has made the limit fifteen miles per hour. The Warner people have made a hit by their method of showing the public what the exact speed of a car is, with their gigantic autometer, which is placed in the tonneau of a touring car, and is now visiting the cities and towns where ridiculous speed regulations prevail. The outfit was described and illustrated in *THE AUTOMOBILE*, issue of June 6, 1907, page 940, when it was being demonstrated in New York City.

Akron, Ohio, which is noted more for its rubber products than any other city in the country, is this year celebrating the one hundredth anniversary of its founding. Among the city's leading industries mentioned in a centennial edition of one of Akron's daily papers is the Diamond Rubber Co., whose remarkable growth in the past nine years is credited with having been a great factor in advancing the population of the city from 42,000 to 60,000. The increase in the automobile tire and other departments of the Diamond factories has increased the number of employees from 250 nine years ago to 2,750 to-day, and the ground area occupied by the plant from six acres to twenty-four acres. The capitalization of the company has increased from \$50,000 to \$5,000,000.

One of the new features which will be used in connection with the Grand Central Palace Automobile Show, in New York City, in which the members of the

American Motor Car Manufacturers' Association are the chief exhibitors, is a special badge for each demonstrator, and which may be used for the purpose of identifying persons taken out for demonstrations, and no other. When a demonstrator leaves the building with a party he will surrender his badge to the officer in charge of the demonstrators' entrance, and will receive in return a ticket for the number of persons in his party, including himself, available for admission at any time within two hours. On his return and delivery of the ticket the badge will be returned to him. This badge is good for admission only between 10:30 A. M. and 6 P. M.

### RECENT TRADE CHANGES.

The Manhattan Storage Company has discontinued its store at 42 Cortlandt street, New York City, and its headquarters are now located at its Fortyninth street store, known as 1611 Broadway, where all business will be transacted in the future.

The Supreme Court of the State of New York has authorized the Matheson Company, of New York, to change its corporate name to the Palmer & Singer Manufacturing Company, and on and after September 5 it will transact its business under the latter name. The company will retain its present location, 1618-1620 Broadway, New York City.

### NEW AGENCIES ESTABLISHED.

Webb Jay, well known in racing circles and formerly manager of the White Company's Chicago branch, has taken the Chicago agency for the Kissel-Kar for 1908, with the Middle West as his territory. In addition the Webb Jay Motor Co. will handle its own steam car, the initial production of which will be ready in about a month's time.

The Autocar Company, of Ardmore, Pa., has discontinued its Philadelphia branch house and transferred its local business in the Quaker City to the General Motor Car Co., which will act as agents for the Autocar in the future. The General Company is composed of W. P. Herbert and W. B. Nicholson, Jr., real estate men, and W. C. MacBride, president of the Haney-White Company, which makes mantels and does general mill work. Neither of them has ever been in the automobile trade, but all are prominent owners and clubmen.

### PERSONAL TRADE MENTION.

G. G. Bowersox, formerly designer and superintendent of the Springfield Automobile Company, Springfield, Mass., has accepted a position with the Pennsylvania Auto-Motor Company, Bryn Mawr, Pa.

C. Measure has been appointed by the Goodyear Tire & Rubber Company as manager of its New York branch, succeeding K. B. Harwood. Mr. Measure has had ten years' continuous experience in the rubber business.

Henry H. Hower has resigned his position as managing editor of the *Motor Vehicle* to take charge of the publicity department of the F. B. Stearns Co., of

Cleveland, O. Mr. Hower was at one time editor of the automobile department of the *Cleveland Plaindealer*.

Charles Schmidt, designer of the Peerless car, sailed for Europe last week to be gone for some time. Mr. Schmidt, having completed the 1908 Peerless, desired a vacation on the other side, from where he came to this country several years ago. He will visit the Paris Salon and generally investigate the foreign field.

A. E. Schwartz, foreign representative of the American Motor Car Manufacturers' Association, who has been in New York for the past month on a business trip, will sail for Paris August 29 on the French line steamer *La Touraine*. Mr. Schwartz is taking with him several new American accessories, which he will represent abroad.

W. H. Conant, formerly manager of the vehicle battery department of the Gould Storage Battery Company, of New York, has been appointed general manager of the Pittsburg Motor Vehicle Company. The company has its plant and main offices in Pittsburg, and is manufacturing a successful type of commercial electric vehicles. Mr. Conant will open the New York offices of the company in the near future.

Manager Day, of the New York City Elmore branch, is off on a four weeks' vacation ramble, with Mrs. Day and the Misses Thomas, in one of the four-cylinder two-cycle Elmore. His route embraces Portland, Me., thence to Quebec and Montreal, down through the White Mountains, thence to the Adirondacks and westward to Lake Chautauqua, where the party will spend a week before returning to New York.

Joseph F. Gunther, who has been identified with Thomas B. Jeffery & Co. and the Rambler interests, both bicycle and automobile, since 1893, has resigned his position as manager for the Chicago branch of the Jeffery company, to take effect September 7. Mr. Gunther will assume the Chicago agency of the Apperson Bros. Automobile Co. on October 1. He is the president of the Chicago Automobile Trade Association.

H. C. Severance, formerly connected with the main office of the Hartford Rubber Works Co., Hartford, Conn., has been appointed manager of the Detroit branch, at 256 Jefferson avenue, that city. Mr. Severance has been connected with the Hartford Rubber Works Co. from his boyhood, and his recent appointment is another advancement in the line of promotions which have moved him up the ladder to one of, if not the most important branches of the Hartford company.

B. A. Gramm is the new general manager of the Logan Construction Company, Chillicothe, O., and B. E. Stevenson has become sales manager, these two replacing B. W. Twyman, who has severed his official connection with the company, although still maintaining an interest in it. F. C. Lindorfer, who has had a thorough automobile experience in several well known factories, is to be the assistant sales manager. In addition to his duties as sales manager, Mr. Stevenson will attend to the publicity and

advertising department, with which work he has been very successful.

**DEATH OF GEO. K. WHEELER.**

George K. Wheeler, sales manager of the Columbus Buggy Company, Columbus, O., died suddenly of heart failure at his home in that city, Saturday, August 24, at the early age of thirty-eight. Mr. Wheeler had just completed a trip covering every large town in the United States, calling on the trade, and was at the factory all the morning on the day of his demise. He went to his home at noon, and was stricken and expired in less than two hours.

Mr. Wheeler was one of the best posted men in the country on electric vehicles, and one of the most enthusiastic advocates of their future, and his loss will be severely felt in trade circles and by his personal friends, who are legion. His remains left Columbus on Sunday, accompanied by his widow, for interment at Boston, his former home, and where his sister resides.

**THE SCIENCE OF PUBLICITY.**

The line of demarcation between available trade news and downright puffery publicity is not as well defined as it should be in what comes from the pens of many auto publicity purveyers. E. Ralph Estep, who has contributed some excellent chapters of Packard publicity, has made a study of the subject, as is made evident by whatever comes from his facile pen. True it is that he calls attention to a particular make of car, but he presents the subject in such an interesting manner that it is readable and interesting to the users of all kinds of cars. Estep is now located in the Auditorium tower, at Chicago, and from his lofty perch in the skies he grinds out a goodly grist of material.

**NEW TRADE PUBLICATIONS.**

To introduce the Holsman automobile to a wider public, the Holsman Automobile Company, of Chicago, has produced an illustrated 24-page catalogue descriptive of their improved buggyabout. The car, which is specially designed for rough work on western roads, usually more suited to the buggy than the automobile, is thoroughly described in the booklet and its special features well presented.

One of the most complete catalogues of automobile mountings, forgings, interior fittings and novelties has been published by C. Cowles & Co., of New Haven, Conn. Comprising about 160 pages, all illustrated, the book includes priced lists of the usual metal fittings for automobiles, in addition to the firm's special novelties and a selection of leather goods for the better class of closed cars.

Recent purchasers and operators generally of the six-cylinder Stevens-Duryea automobile will find useful information in the instruction book issued for their benefit by the Stevens-Duryea Company, of Chicopee Falls, Mass. The method pursued is to take each mechanical part separately and describe it in detail, pointing out the treatment it should receive to obtain best working results. Practical operating instructions are given and there are a number of useful hints which the beginner would do well to take to heart. The booklet is well illustrated.

**INFORMATION FOR AUTO USERS.**

**New Master Vibrator or Synchronizer.**—The K.-W. Ignition Co., 34 Power avenue, Cleveland, O., has just brought out a device intended to eliminate difference in adjustment, as well as in the

exist in the timing of the four vibrators, and also compensates for the varying lag of four different vibrators by substituting one, thus giving exact synchronism and causing the charge to be fired in each cylinder at the same relative position of the piston, in the same manner as is accomplished by means of high-tension distributor and single coil. It possesses the advantage, however, of synchronizing the low-tension side of the circuit, thus obviating the high-tension distributor and its attendant evils.

K-W MASTER VIBRATOR.

time element, or lag, of the different vibrators of the coils of multi-cylindered engines. The device consists of a well-made and rapid vibrator, mounted in a neat mahogany case, together with a powerful condenser. It is also equipped

ARRANGEMENT AND WIRING PLAN.

with a switch designed to use either two sets of batteries or a battery and the K.-W. magneto. It is intended to be attached to the dash, and is connected in the circuit as shown by the diagram, Fig. 2, the device itself being illustrated by Fig. 1. From the wiring diagram it will be noted that the connections are run directly from the battery to the master vibrator, while a second lead is taken from the central binding post on the latter to one of the terminals of the coil. This places the synchronizer in series with the battery and coil, or with the magneto and coil. When applied to vibrator coils the tremblers are not allowed to operate, but are short-circuited by a small piece of copper wire, as shown by the small sketch forming part of Fig. 1. Thus the current does not pass through the coil vibrators, but through this short shunt, as indicated.

This K.-W. master vibrator thus obviates any lack of synchronism that may

**Rutenber Carbureter.**—The name Rutenber is well known to the trade throughout the country through its association with the well-known Rutenber motor, and E. A. Rutenber, one of the makers of the latter, located at Logansport, Ind., also manufactures the Rutenber carbureter. These carbureters are made of brass and so constructed that the bowl contains the float, float-valve and all its fastenings, the float being of the concentric or annular type, with the needle valve-adjusting screw on top. The valve is made of steel for greater durability and is controlled by a hinged lever attached to the float, making it positive in its action and preventing any tendency to flood. Gasoline is supplied through a

RUTENBER CARBURETER.

reversible union, allowing the feed-pipe to be run in the most convenient manner. The mixing chamber is semi-circular in form, with the spray nozzle at the bottom and in the center of the

SECTIONAL PLAN RUTENBER CARBURETER.

bowl, thus maintaining the mixture the same, regardless of the grade the car may be on at the time. It is made with vertical or horizontal outlet, and a good idea of its appearance may be obtained from the accompanying illustration.

The Safest Way to Store Gasoline

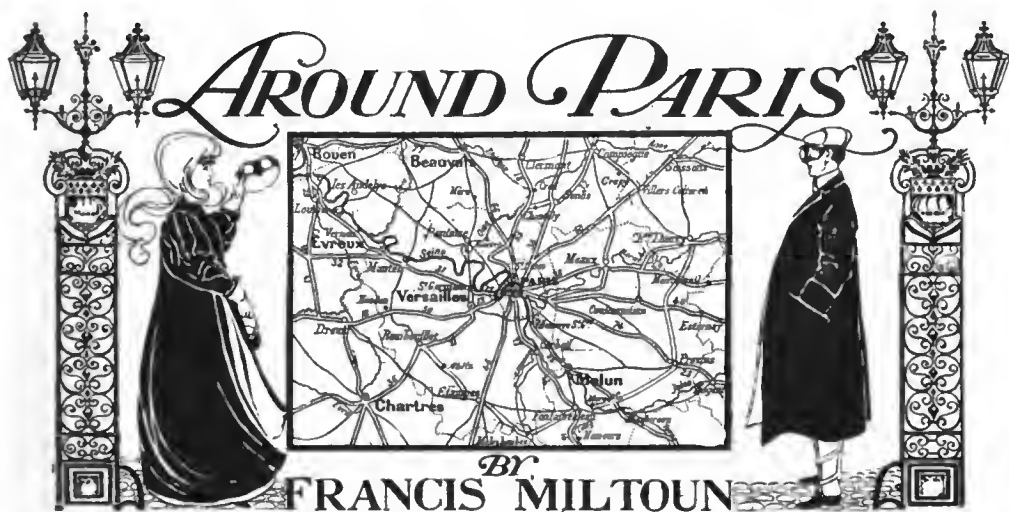

The NATIONAL is the only pump that discharges gasoline at every movement of the crank; it saves one-half the labor and one-half the time to pump gasoline; there is no evaporation or leakage; the tank is buried underground; the pump may be put in the building in a convenient place. It is the safest way because it meets all of the requirements of The National Board of Fire Underwriters.

For a Garage owner the National portable wheel tank will enable you to fill a car quickly by pushing the wheel tank by hand to the car. It is easily handled even in case the car would be at the curb.

The NATIONAL is also adapted to private motorists, also for lubricating oil storage. Ask for catalogue—it will explain all about the National System.

The National Oil Pump and Tank Co., DAYTON, O.

# THE AUTOMOBILE

be turned over than that to be found in many regions more remote.

Since the touring automobilist coming from abroad, whether he be American or English, usually arrives via Havre or Dieppe, and via the valley of the Seine, he ultimately comes to St. Germain just before entering Paris—this point has been taken as the commencement of the itinerary. If one actually is in Paris he can go out by any of the *portes*, or gates, as marked on the accompanying sketch map, and take up with the itinerary where he will at any point along its periphery; interest is pretty equally divided.

There are very good reasons for entering France with one's automobile via Havre; there are better facilities for unshipping it than elsewhere; there is a garage proprietor there (Burton) who

IN the first place, the touring automobilist has no reason whatever for taking his automobile into Paris. It's the most dangerous place for the stranger automobilist to navigate that exists on earth, and if the women folk want to "shop" or drive in the Bois just hire a taximeter—it's cheaper, more convenient, and the responsibility in case of accident is on some one else's shoulders. You may even hire an "auto-taxi" with a *chauffeuse* instead of a *chauffeur*, and that will have the element of novelty to it worth paying for.

Probably few foreigners, and perhaps not many Parisians, know the delights and charms of all the cities and towns, and the neighboring countryside, within say a radius of fifty miles from the Place de la Concorde. Within this charmed circle there is a wealth of shrines at which one may worship, and uncounted kilometers of crossing and recrossing historic highways, which most stranger automobilists would like to make acquaintance with if the way were only pointed out. There is, to be sure, a stretch of roadway now and then, even outside what may be called suburban Paris, which is distinctly bad, because of the awful *pavé*. There is such a stretch through St. Germain-en-Laye, another at St. Denis—en route to Chantilly and Compiègne and at Villeneuve-St. Georges—going out to Fontainebleau; and very bad samples of roadway they are.

### A Charming Circle 500 Kilometers Round Paris.

A great circle drawn around the "ville lumière," with a circumference of five hundred kilometers, more or less—and often not out of sight of the Tour Eiffel or the Sacré Cœur—will give two or three days (or better a week) of as enjoyable sightseeing touring as can be had in a straightaway run across the better part of France to Aix-les-Bains or Vichy.

The following outline is only an approximate possible itinerary, and if it is not desired to cover the entire ground portions of it can be combined with the Normandy tour, or taken en route from Paris to Switzerland, to the Rhine, or down into Touraine. It will be time well spent for those who have hitherto thought they already knew France well, and considerable newer ground will

especially concerns himself with getting you "started right," and will even arrange the preliminaries of your "Certificat de Capacité" and "Recepiissé de Déclaration"—if you advise him beforehand—and may perhaps be able to save you twenty-four or forty-eight hours hanging around Havre or Rouen trying to accomplish the thing yourself, with only the vaguest notions as to how to go about it. Once one has finally got free of those "formalities" and his port of entry—of which particulars have many times been given in THE AUTOMOBILE—one reaches St. Germain via the great Route Nationale, familiarly known as the "Route de Quarante Sous," because—supposedly—some poor *chemineau* tried once to cover it from Rouen to Paris on less than half a dollar.

The *pavé* of cobble stones through the main streets of St. Germain is about as bad as you will find. There is good garage accommodation at the Hotel du Pavillon Louis XIV., and the eating and sleeping arrangements are equally good and expensive, the hotel being appointed by the Automobile Club de France

and three-starred in the "Guide Michelin." Still this is the place to stop whilst "doing" St. Germain, its Chateau Neuf of Henri Quatre, the remarkable birdseye view from the Terrasse built by Le Notre in 1672, and the great alleys of the Fôret. It is all hallowed and historic ground, and the guide books will enumerate the "sights" more fully.

#### To Reach Versailles and Avoid the Villainous Pavé.

From St. Germain to Versailles is only twelve kilometers, descending to the level of the Seine and then climbing up again through Marley. The awful *pavé* now disappears, in part, but what there is left is bad enough; it can be entirely avoided by leaving St. Germain by the route through the Fôret de Marley, and entering Versailles by the back door, as it were, and the distance is not perceptibly greater.

Versailles and its chateau and its gardens, its fountain, its Trianons and all its other sepulchral charms, called mistakenly the glory of France, is the beau ideal of the tourist's chateau, albeit it is a theatric, unreal ensemble and has not a whit of the artistic value of many others less well known. For the sightseer Versailles is worth half a day, however; it can hardly be done in less. That makes, with St. Germain, practically a day already, but one can readily enough get on to Rambouillet, another thirty kilometers, for the night and avoid much that will be objectionable in the hotels of Versailles, luxurious though they be. Versailles is fast becoming an American residential suburb for Paris; perhaps this is the reason prices are so elevated.

The road to Rambouillet from Versailles via Trappe through the Fôret de Rambouillet, where were held the royal hunts of other and more picturesque days. Here, too, are still held "Les chasses Nationales," when visiting royalties are invited to go out and kill something by the present figurehead of republican France. The road is a delightful one through its whole length, and in the forest itself it runs through great alleys of pines in a most romantic and truly delightful fashion.

As one comes up with Rambouillet, the town, there is more cobble stone *pavé*, and particularly vile it is. Either the Croix Blanche or the Lion d'Or are good enough hotels, at any time except between Friday and Monday, when they are apt to be filled with week-end trippers out from Paris. The attractions of Rambouillet are its chateau, which since the very earliest times has ever been a royal hunting lodge. François Premier died here, and in Napoleonic days it was a retreat for many of the followers of the little corporal, and he himself—at the end of his first day's journey when going to his exile—slept within its walls. Here, too, at the end of monarchical times under the restoration, Charles X. signed his abdication.

#### Historic Interest, Good Roads and No Speed-Traps.

Straight on from Rambouillet the route nationale leads to Maintenon and Chartres, but circling Paris one takes the second class road to Etampes, via Ablis, in all forty-three kilometers. It is a second-class road, but does not look it, and, being a byroad, one can let his automobile out for all it is worth, for there is little or no traffic to stop one, and the gendarmes hereabouts are lenient.

Etampes dates from the year 604, and accordingly has a respectable old age to its credit and a history quite as worthy. Various councils of the church were held here when the church practically ruled the state, and the Roi Robert of the second race of kings built a palace here known as the Palais de Quatre Tours,

and François Premier, by making the celebrated Anne de Pis-seleu the Duchesse d'Etampes, did much more for its popular fame. Etampes has left to-day the Tour Guinette, a part of the chateau which existed before the twelfth century, with the churches of St. Giles and St. Martin dating from the same period, but with later Renaissance interpolations, and another church, that of Saint Basil, which owes its foundation to King Robert in the tenth century. Etampes really, take it all in all, is worth seeing, and the Hotel du Grand Monarque is not bad, either; nine francs a day, not more, all found, and the proprietor has been heedful of some recent advice given by the paternal Touring Club de France, with a desirable result with respect to matters sanitary in his grandiloquently-named establishment.

From Etampes to Malesherbes is a run of twenty-six kilometers through the heart of the Gatinais, a region as forest grown and as sylvan as the Adirondacks, but not so grand. It is the most thickly wooded of any of the *petits pays* of France bordering upon the Ile de France, a land of pleasant valleys and rolling hills, and all green or gold, according to the season of the year. The chief product of the Gatinais, and in great repute in the mar-

kets of Paris, is honey; not the per-fumed kind served up for breakfast in the average six-francs-a-day pension in Switzerland, but the real thing, made by bees, and not fabricated by the hand of man. Malesherbes has a thirteenth century church and a chateau which contains some good furniture of the days of the Louis, and some Gobelin tapestries. There is also the Chateau de Rouville in the suburbs. The town is worth an hour or two, and then the road runs direct—this time a route nationale again—straight through the heart of the Fôret de Fontainebleu, the grandest, perhaps, and certainly the most celebrated, forest in the annals of history and art. Fontainebleu's attractions are many and for all men, and to none more than to automobilists, for the uncounted kilometers of well-kept forest roadway

have a great charm and novelty for one who has driven his capable automobile over hundreds, perhaps thousands, of scrubby roads bordered only by snake rail fences or a railway track. They do things differently in France, verily! Strike right through the forest and enter the ville by the Grande Rue, past the palace gates, and put up at the Candran Bleu for *déjeuner*.

#### After the Palace, the Forest Retreat of Artists.

As a sight Fontainebleu's palace, the outgrowth of Louis VII *rendezvous de chasse* of the twelfth century, is quite worth the greater part of the afternoon, when there will still be daylight enough left to make the "Grande Ronde" in the forest, including a detour to take in that little artists' village of other days—Barbizon. Have your *apéritif* here at the "Charmettes"—or tea if you affect that sort of thing—look through the closed gates into the gardens of the houses once occupied by Corot, Millet, Diaz and Bayré, buy souvenir picture post cards to your fill (which you will forget to post till you are hundreds of kilometers from Barbizon) and then take the road again across the forest, twenty kilometers southeast, to Moret-sur-Loing. This is an ancient little town, with two fortifying gateways at either end of its main street, situated just over the further edge of the forest. It is an artists' sketching ground as famous to-day as was Barbizon in the past.

"Les Violettes"—not a hotel, a pension or a boarding house—will care for you marvelously for six francs a day, and you will think you never met with anything quite so good for the price,

FORTY MILES ROUNDABOUT PARIS.

nor anything quite so dainty and picturesque as Moret itself, with its gates and towers, its donjon, its church and its flour mills built out over the river in real stage carpenter's fashion. It is astonishing how unreal the real thing can be sometimes! Truly Moret is a paradise for artists!

The next morning, following up the road by the Seine, just over the ridge back of Moret, you will have a delightful fifty kilometers to Provins, via Bray. Provins is one of the most appealingly historic small towns of France (once its population was 60,000, tenth century; to-day it is 8,000). It has a round half dozen architectural monuments which rank supreme in their respective classes, from the famous Tour de Caesar and the city walls to the Renaissance Eglise Ste. Croix. The Hotel Boul d'Or at Provins is bound to keep one for lunch; time will pass quickly in this old mediaeval town; and anyway you might do worse, though there will be no ham and eggs or grilled kidneys on the menu. One doesn't come to France for such gastronomical trifles.

**Where France Makes Cheese and Automobile Records.**

From Provins to Chateau-Thierry, in the valley of the Marne, is sixty odd kilometers, via la Ferté-Gaucher, with nothing much to detain one en route except the wonderfully diversified landscape through which one passes. This is the Pays de Brie, and is as famous for its cheeses as is the Gatinais for its honey. It is a fact that the only *real* Brie cheese comes from hereabouts; all others are rank imitations and decidedly not so good, either in taste or quality.

At Chateau-Thierry one is in the valley of the Marne, a highly industrious, work-a-day river like the Seine, but if possible more picturesque. Certainly there are no poplar-lined river banks quite so charming as those of the Marne. It would be an ideal river on which to journey in a motor boat, and you could even reach the Rhine by the canal which joins the two rivers in their upper reaches. Here's an idea for some one who would like to make an unconventional voyage by motor boat. Chateau-Thierry has a first class literary shrine in the birthplace of

Lafontaine; a historic one in the ruins of its mediaeval chateau, and a sporting one in the site of the famous hill-climb. The hotels here are curiously named; one is called the Elephant and the other the Swan. You take your choice, according as you prefer large or small game. So much for Chateau-Thierry, and if the afternoon is still young you can easily roll off another forty kilometers to Meaux, by the valley road along the Marne, and still arrive further on for the

night's stopping place. Meaux is worth a good hour; the city of Bishops has a grand old cathedral, a charming and dainty ruined chapter house, an old Episcopal palace, a battery of curious old water mills astraddle the river, and the remains of a chateau built by the Counts of Champagne in the thirteenth century. Such a menu should satisfy the

sight-scoring palate of the most exacting American tourist.

**In the Home Land of a World-famed Romancer.**

Villers-Cotterets is forty kilometers northwest of Meaux. It can be reached direct from Chateau-Thierry in about the same distance if it is desirable to omit Meaux. It is the birthplace of Alexandre Dumas Père, and the site of an old royal chateau of the Valois, around which still hangs a certain sentimental glamour, in spite of the fact that it has fallen from its high estate and become an almshouse. The Hotel du Dauphin is decidedly the best stopping place for the night in these parts. It is entirely fitted with the famous and deservedly well-thought-of "*chambres hygiéniques*" promulgated, if not invented, by the Touring Club de France, and has got—of all astonishing things—accommodations for thirty automobiles under cover. Dumas Père was born at Villers-Cotterets; the house is pointed out with pride by every resident of the place, and it sits full on the main street. Here, and in the neighboring town of Crepy-en-Valois, Dumas spent the early years of his life, before he went up to Paris to become the greatest romancer of his age.

This Forest of Villers-Cotterets is one of the historic forests of France. It was first set out by François Premier, and beneath its shade have dawdled a whole portrait gallery of historic and gallant figures, the art loving François, his friend Anne de Pisseleu, whom he made the Duchess d'Etampes, his discarded friend, the ageing Diane de Poitiers, who came back again later with the youthful Henri II in her train, and finally there were Henri Quatre and his whilom friend, the fair Gabrielle d'Estrées, who had more than one clandestine meeting here. The forest is not what it once was, the prodigal and selfish Napoleon III having cut it largely down and into firewood, which he sold for a profit to himself. These literary and historic trails stretching all over France are one of the chief charms of travel in this fair land, particularly to one who comes from a country whose literary landmarks do not go back of the era of the "Wayside Inn" or "Rip Van Winkle."

There are two other trails in the immediate neighborhood which are well worth covering if one has the time. One of these is that of the flight of the unhappy Louis and

the Royal Family to Varennes, passing through Meaux and Chateau-Thierry, every league of the way outlined and mapped in the written account of literature and history. The other is in the wake of the gentle R. L. S., on that memorable occasion when he made that delightful "Inland Voyage" down into France from Antwerp and the North Sea, via the canals of Belgium, and finally the river Oise. His trail or rather the wake of his little canoe passed close by, at Compiègne in fact. It was here, it will be recalled by all who know this delightful little book, that Stevenson suddenly terminated his voyage, by reason of his having received news in his letters which he made the fatal mistake of calling for at the *poste restante*. That finished his voyage.

#### Chantilly Equals Versailles in Real Interest.

Crossing through the forest here the writer recently met a little Oldsmobile, merrily churning away without fuss or feathers, and eating up the straight roadway at a good twenty-five-mile-an-hour clip. One sees these little "horseless carriages" quite frequently in Paris, and the French have adopted our own original name for them and call them *voitures sans cheval*, but they are not often met with in the country. From Compiègne to Chantilly is perhaps forty kilometers, following for the most part the valley of Oise, another of the picture rivers of France, but again a most industrious one. The Chateau de Chantilly shares the honors with the Palace at Fontainebleau in abounding interest for the visitor. Each of them is far and away ahead of Versailles or St. Germain, though thousands visit the two latter to hundreds the former. This is inexplicable, of course, but is a demonstration of one of the inconsistencies of the sightseer.

Chantilly, at any rate, needs a guide book to itself, its attractions cannot be catalogued here. Put up at the Hotel du Grand Condé, which sounds romantic, is good and expensive, and very sporty—for the horse racing at Chantilly is, for many, the chief reason for coming here at all, and horse people demand a showy, luxurious board when they sit down to eat, and much looking-glass in the bar when they drink. All these things are here. At Chantilly let the horse-racing go by the board, and dodge the Irish and American jockeys and stable boys—if you can—and devote yourself to the two Renaissance chateaux, the Ecuries of the Condés and the great collection in the Musée given to the State by the Duc d'Aumale. All this will take half a day—with lunch—but get on to l'Isle-Adam, or Auvers, for the night, unless you insist on those palatial appointments of the hotel at Chantilly with the grandiose name. At Auvers, at the Hostellerie du Nord, you will tumble upon something unique in the hotel line, very simple, very Bohemian—as that term is understood of the people—for the house caters mostly to artist folk, and Parisians at that, and withal the price for everything is very modest. You may dine in the garden courtyard, under a sort of a tent, at a long table, with chickens and pigeons and cats and dogs strolling about and looking for tit-bits, and per-

haps even a stray pet lamb, if the beast hasn't grown into a sheep by this time. If this is a little too much *en famille* and you would have more seclusion you may dine in the paneled *salle à manger* with its walls covered with pictures and croquis by painter folk from Daubigny down to various Montmartre eccentrics.

At last we have swung around the circle, in three days or five, according as to whether we have lingered by the way or made the *vitesse*, as your French chauffeur says, between towns. If one is bound south of Paris, down into the chateaux country—Touraine—it is easy to make one's way via Pontoise, St. Germain, Rambouillet and Chartres. If England's leafy lanes are the objective, another en-

joyable three or four days can be put in covering that historic highroad from Paris to Boulogne or Calais. Usually the automobilist from abroad rushes this in a day or less, but this is wrong, of course, for the district is rich in interest.

In outline the itinerary works out something like this: Beauvais (Hotel de France et d'Angleterre), with the most stupendous late Gothic cathedral standing above ground; Amiens (Hotel de Rhin), whose cathedral has been called the Bible of architecture; Abbeville (Hotel de France), where at any rate you should stop long enough to view the Eglise St. Wulfran. After this loaf along easily to Montreuil-sur-Mer, fifty kilometers, and put in the night at the Hotel de France, which bears a date of the sixteenth century over its *porte cochère*. The hotel is a rambling, creaking old structure whose only signs of modernity are in its *salle à manger* and in the electric light wires stretched along its three-century-old beams. When you ring the bell in your bedroom though, you pull a bell-cord, and one of a row of jangling *cloches* rings out down in the courtyard—for any one to answer who happens to hear it. Modernity here hasn't got as far as electric bells.

The passage across to England is best made by automobilists via Boulogne, via Calais automobiles are only carried by cargo-boat. The cost is approximately twenty dollars and the loading, crossing, and unloading will consume half a day. If you are not conversant with the manner of getting in or out of France, and the formalities attendant thereon, you had best get some garage man who looks as though he wouldn't take advantage of you to smooth the way for you, and pay him a dollar or so; it will save you a lot of personal annoyance and perhaps some money. Sergeant, the Michelin agent, would probably do the business as well as any one. The hotels of Boulogne are unlovely and unsatisfying; take the one you best like the looks of, or is most convenient, it will answer as well as any. Finally, you will have as uncomfortable an hour's crossing—in fair weather or in foul—as you will get in these days of usually luxurious travel.

WITHIN SIGHT OF PARIS

# Italy Closes its Race Season with a Double Victory

**B**RESCIA, Sept. 2.—Owing to the multiplicity of European regulations, two distinct races were provided for by the Milan Automobile Club, to be contested on the Brescia circuit. On Sunday forty machines complying with the conditions first formulated for the German Emperor's race, struggled over the 43 miles of winding circuit until Minoia, driving No. 21 Isotta-Fraschini, captured the Florio Cup in 4:39:53, being an average speed of 64.7 miles an hour. Hemery and Hanriot, for a long time team mates at the Darracq factory, came second and third, both on Benz machines built in Germany.

A series of accidents, due in large part to the lack of experience of the drivers in high-speed events, marked the race. Henry Fournier's Itala broke down at about half distance without any injury to driver or mechanic. Later the German Gagneau car, driven by Hieronymus, entered into collision with No. 8 Bianchi, handled by Tommaselli, with the result that both cars had to be withdrawn and Hieronymus suffered a broken nose. Durlacher, with No. 3 Wolsit, an Italian machine built under British Wolsley license, missed one of the turns and shot over a railroad bridge to the track below, being picked up in a rather serious condition. Unfortunately one fatal accident occurred as the result of the breaking of the steering gear of No. 37 Brixia-Zust when traveling at a high rate of speed. Baron de Martino, the driver, was thrown against a tree and instantly killed.

Not more than seven of the drivers, conspicuous among whom were Hemery, Hanriot, Fabry, Fournier and Cagno, had had previous experience in long-distance international races. Practically all the Italian and German drivers were men who had earned their reputation in local races; as several events have proved, a number of such drivers in a big race constitute a source of danger. Nazzaro, who won the first race under German Emperor rules, did not participate, neither did Moore Brabazon, the victor of the Ardennes race under similar conditions. French machines were conspicuously absent, the only representatives being Darracq, Rochet-Schneider and Aries. V. Florio competed for his own cup on a Darracq, with Henry Walker as team-mate.

Cagno, starting fourteenth in a field of 17 competitors, won the handsome trophy "Winged Victory," valued at \$5,000, in 4:37:36 for the 301.9 miles, or an average of 65.2 miles an hour. The machines, ten of which had competed in the French Grand Prix, and were called upon to run in this event under similar conditions, failed to approach the brilliant performance of Nazzaro on the Dieppe circuit, when, with his Fiat racer, he averaged 70.61 miles an hour. Considerable allowance must be made for the differing natures of the circuits, the Dieppe course being one of the fastest in Europe and the Brescia roads somewhat winding. Notwithstanding this, however, it is felt that the ten French and seven Italians did not make the best showing under limited fuel consumption rules. The winner only averaged a mile an hour more than the smaller racers under German Emperor conditions, though the average difference in the horsepower ratings of the two classes was about thirty. Fiat and Renault teams did not compete, consequently Nazzaro and Szisz, who did the fastest work in the Grand Prix, were unable to show their skill on the North Italy circuit. Victor Demogeot, driving the only Darracq machine in the race, came second in 4:40:49, followed at an interval of five minutes by Rougier, driving No. 1 Dietrich.

Starting at 5:30 A.M., and intervals of one minute, the three Bayard-Clément, three Brasier, three Itala, three S. P. A., three Dietrich, Diatto-Clément and Darracq were led on the first round by E. Fitz Shepard driving the Bayard-Clément which he bought when the French factory decided to abandon racing after the death of Albert Clément. On the second round Fabry, on an Itala, got ahead of Shepard, and on the third round the American dropped down to third position. Later he forged ahead of the Itala and regained second position. While running on the fifth round in fifth position the Bayard-Clément car skidded on crossing the bridge over the Montichiari river, broke down the low railings and dropped into the shallow water five feet below. Shepard broke his collar bone and his chauffeur, Ledmann, had his face cut and bruised. Neither of them, however, is in a serious condition. Shepard's racing career has been one series of ill-luck.

E. FITZ SHEPARD, THE UNLUCKY, ON BAYARD-CLEMENT.

**Influence of Automobile Durability on Demand.** Time was and not so very long ago either when it was popularly considered that the automobile industry was supported mainly by that class of autoists who purchased new models with each recurring season. From 1900 to 1904, models not only followed one another so closely, but differed so radically, that cars became antiquated, both in appearance and design, with the passing of a twelve-month. It was necessary to invest in a new car every year in order to be up to date. This certainty of excessive depreciation deterred many a prospective purchaser in the earlier days, and unfortunately, the idea has not been dispelled altogether by any means. There are still those who regard the automobile as fleeting in this sense of the word.

As a matter of fact things have gone to the opposite extreme. The active life of the modern car has been extended so many years that there is every reason to believe that it will exceed that of the average piece of machinery owing to the superior materials and workmanship employed. Moreover, the fallacy of early day impressions is now evident in the number of old cars that are far from being on the retired list and that will do active duty for some time to come. Then what is to become of the automobile manufacturer? ask a few short-sighted alarmists. With cars built to last indefinitely, where is his market to come from? Were it not for the fact that the recent financial upheaval in the industry appeared to lend color to them, such queries

would scarcely merit comment. As it is, they are absurd, being based on the assumption that autoists as a class comprise a body that is stationary, or at least that never increases in numbers. It goes without saying that there is no longer any need to purchase a new car every season, either to be up to date, or to have one that will operate satisfactorily, but that the industry should immediately wane on that account hardly follows as a logical sequence in view of the tremendous increase in the number of autoists with each passing season, as well as the production of machines to suit a far wider range of purchasing ability.

**Deceptiveness of Present Day Engine Ratings.** There was much confusion on the part of the man in the street when the automobile manufacturer fell into the habit of bestowing upon his product a hyphenated horsepower rating. It is naturally difficult for the layman to conceive of conditions under which the same motor can produce such varying powers as "24-30" for instance, despite its extreme simplicity to the engineer, and it must be admitted that the explanations forthcoming by garrulous show attendants and others has done far more to add to the confusion than otherwise. Cylinder dimensions have been suggested as an alternative, but of what use are they to the amateur, when in the same breath, the maker informs him that his motor will produce either 40 or 80 horsepower?

So far as the man in the street is concerned, the problem is not of pressing importance, and as a matter of fact, it will work out its own salvation. In the meantime the confusion extant gives rise to some amusing situations. The French makers rate their motors as low as they possibly can because horsepower means taxes in France; ditto in Germany. Hence, a 12 is really a 20; an 18 really a 30-horsepower machine. Here there is no horsepower tax nor anything akin to it, but still there are 30's which are really 50's, also 30's which are 60's. Except for the purposes of racing and hill climbing, what does it matter? The man who owns the machine wants it to pass the other fellow's whether on the level or the hill, and if his be called 30-horsepower and the other man's 50-horsepower, so much more the glory of passing him. It is a strange mixture of meaningless terms that will sooner or later resolve itself without extraneous aid.

**Concerning the Show Situation this Year.** Automobile manufacturers have found it possible to beat the calendar by half a year in having their models for the following year on the road in the early summer, and have shown that their efforts in this direction have not ceased by any means, so, like the evening editions of the yellow journals that are on sale by 7 A.M., we may be having 1909 models ready before the 1908 open season is on at all. This last is immaterial, or at any rate, beside the question. The fact of the matter is, this general jump on the part of the makers from December to June, has made necessary a corresponding revision in show dates, which, however, could not be made quite as sweeping as have been the advances already referred to. Last year marked the first departure from the custom of holding a show in the year of the models exhibited. This step brought the opening of the show season from January to early December.

Since then it has been pushed back almost two months, so that the first New York show will be opened in the latter part of October; in fact, such has been the change brought about that the opening of last year's show season will practically correspond to the closing of the 1907 season, barring the newly inaugurated importers' event, which continues the time-honored January date for obvious reasons. With this exception the two New York shows and the Chicago show will be condensed into little more than a month. Such an arrangement not alone benefits the makers by minimizing the amount of attention to be devoted to exhibiting, but also the automobile public as well, by concentrating the show season at a most convenient time of the year.

### SESSION OF THE A. A. A. RACING BOARD.

Hereafter any club member of the A. A. A. which associates itself in any manner in the conduct of a race meet will be held responsible for the delivery of the prizes and the enforcement of the rules. This action was taken at a meeting of the executive committee of the Racing Board, held at A. A. A. headquarters, 435 Fifth avenue, New York City, Thursday, August 29.

The resolution adopted and recommended for confirmation by the Board of Directors, which will meet in September, is as follows: "Any club of the A. A. A. which associates itself in any way, wholly or partially, with the proposition of a race meet shall become responsible for the delivery of the prizes as stated on the entry blank, and also for the enforcement of the racing rules of the A. A. A."

Approving the recent action of Acting Chairman Pardington, the United States Motor Racing Association, Inc.—Joseph M. Gaites, president; Fred T. Bailey, vice-president; and W. H. Pickens, general manager—was indefinitely suspended, collectively and individually, and all sanctions granted to the said association were cancelled, such action being taken for irregularities in the conduct of the race meet held at Brighton Beach, New York, August 9-10.

Recognizing that the present racing rules require some revision to meet new and changing conditions, the Board requested its technical advisers, within the next thirty days, to prepare for submission to the Board a draft of those changes which in their opinion would bring about a more satisfactory classification and general results in competition. The technical advisers are: E. R. Thomas, N. A. A. M.; A. L. Riker, A. L. A. M.; Henry Ford, A. M. C. M. A.; J. J. Mann, A. C. of France.

It was decided to postpone the consideration of the rules adopted by the Affiliated Automobile Clubs of the World until the return from Europe of Chairman Jefferson de Mont Thompson and William K. Vanderbilt, Jr., who have had conferences while abroad with representatives of the foreign clubs.

In connection with the hill climb held at Wilkesbarre, Pa., May 30, the protest of Walter White, driving a White steamer, against being barred from the free-for-all event was sustained and he was adjudged the winner of same, his time, 1:49 4-5, being the fastest of the climb. The protest of D. Walter Harper against being barred was also sustained, and he was declared winner of events 4 and 7. The Wilkesbarre Automobile Club was requested to deliver the prizes for these events as above decided.

The decision of Referee Duncan Curry rendered at the race meet of the Atlantic City Automobile Club, held at Atlantic City, N. J., August 5-6, disqualifying A. W. Church's Stearns in event No. 3 on the ground that it did not comply with the definition of a touring car, was sustained. To properly determine the exact division between touring cars, touring runabouts, and runabouts, the Board announced the following definitions:

**Touring Cars.**—A touring car shall be one provided with a tonneau and seats for at least five (5) adults; two (2) in front, and three (3) or more in the tonneau.

**Touring Runabouts.**—A touring runabout shall be a car provided with two (2) seats in front, and a single permanent seat in the rear.

**Runabouts.**—A runabout shall be a car provided with two (2) seats side by side.

The Racing Board not having received a report from the special committee of the Chicago Automobile Club, which was requested to investigate and report on the 24-hour race held at the Harlem track in that city, July 12-13, the Board was unable to give consideration to this event.

Owing to the meager amount of evidence submitted in reference to the 24-hour race at Detroit, Mich., July 21-22, no decision could be reached. Interested parties have been called upon to make affidavits supplying the missing parts of the evidence.

The following were present at the session: A. R. Pardington, acting chairman; R. Lincoln Lippitt, Rhode Island A. C.; S. M. Butler, A. C. A.; A. G. Batchelder, N. Y. M. C.; A. L. Riker, technical adviser; F. H. Elliott, secretary.

### A. M. C. M. A. MEMBERS DRAW SHOW SPACES.

With applications amounting to 30,000 square feet of floor space, and but a total of 26,000 square feet available, the drawing for spaces at the Palace show, October 24-31, held at the American Motor Car Manufacturers' Association headquarters on Saturday last in the Spalding Building, was an interesting event. The Reo Motor Car Company was fortunate in drawing number one, which gave it first choice. Others who secured center spaces were the Dayton Motor Car Company; Ford Motor Company; Premier Motor Manufacturing Company; National Motor Vehicle Company; Maxwell-Briscoe Motor Company; Mitchell Motor Car Company; Wayne Automobile Company; St. Louis Car Company; Jaskson Automobile Company; Bartholomew Company, and the Mora Motor Car Company. Incidentally, trade conditions came up for discussion and it was the consensus of opinion that the outlook for 1908 could hardly be better, some of those participating being Benjamin Briscoe (Maxwell); A. C. Newby (National); Gaston Plaintiff (Ford); W. H. Vander Voort (Moline); R. B. Crawford (Crawford); C. F. Case (Rapid); H. O. Smith (Premier); Ray Owen (Reo); Wm. Mitchell Lewis (Mitchell); and Frank Weston (Overland).

### BALTIMORE HOLDS LABOR DAY RACES.

BALTIMORE, Sept. 2.—Five events comprised the program of the Motor Car Racing Association on Labor Day at the Gentlemen's Driving Park, and attracted a big field of spectators. Interest centered in the 50-mile race for stripped touring cars, the contestants being two Stoddard-Daytons, an Aerocar, a National, and a Pullman. E. F. Dobson on a Stoddard-Dayton took the lead, followed by the Aerocar until the tenth mile, when the Pullman got second place. Later the Pullman had to retire through the loss of a tire, when the Aerocar secured and retained second place, followed by E. L. Leinbach's Stoddard-Dayton and George Norwood's National. An Autocar driven by E. H. Freas and a Pullman driven by E. F. Dobson competed in the final for the five-mile runabout championship, the Autocar winning by two lengths. W. S. Fisher won the five-mile race for motor-cycles against six others, all riding Indians. The summaries follow:

#### FIVE-MILE RUNABOUT CHAMPIONSHIP.

1. Autocar, 30-horsepower; driver, E. H. Freas.....7:15 2-5
2. Stoddard-Dayton, 30-horsepower; driver, E. F. Dobson..7:15 4-5
3. Pullman, 30-horsepower; driver, Peter Burgard.

#### FIFTY-MILE RACE FOR STRIPPED TOURING CARS.

1. Stoddard-Dayton, 30-h.p.; driver, T. F. Dobson.....1:12:50 4-5
2. Autocar, 30-horsepower; driver, E. H. Freas.....1:13:36
3. Stoddard-Dayton, 80-horsepower; driver, E. L. Leinbach.
4. National, 50-horsepower; driver, George Norwood.
5. Pullman, 30-horsepower; driver, Peter Burgard.

### DISASTER BEFALLS DENVER TRACK MEET.

DENVER, Sept. 2.—In the 50-mile endurance race at the Overland Park, W. B. Walker, a prominent local business man, was killed by being thrown against a post after a tire had exploded on a turn. E. V. Dasey, who was following, tried to avoid the crowd which swarmed on the track and either lost control of his machine or fainted, for he fell from his car and was killed. Brinker, the only other driver on the track, struck a fence and was bruised.

### BOSTON MEET POSTPONED BECAUSE OF RAIN.

BOSTON, Sept. 2.—Heavy rain put the track at Readville in such bad shape to-day that it was impossible for the Bay State Automobile Association to run off its program of races. Postponement was made until Saturday, September 14.

### W. K. VANDERBILT DECLINES TO DISCUSS RACE.

W. K. Vanderbilt, Jr., and Mrs. Vanderbilt arrived from Europe on the *Kronprinz Wilhelm* last Tuesday. Before leaving for his cottage at Great Neck, Mr. Vanderbilt said that he had nothing to say concerning the Vanderbilt Cup race.

**S**IX-CYLINDER Berliet, the latest product of the American Locomotive Company, was charmingly introduced to the members of the press at the Providence, R. I., factory last week, prior to going forth to greet the wide world on its own substantial merits. All the technical journals and representatives of New York's dailies united in response to the company's invitation and spent a few hours wandering through the Berliet factory under the leadership of General Manager James Joyce, Superintendent F. R. Boynton, General Sales Manager F. M. Hoblitt, and Assistant Vice-President R. B. Van Dyke. A 20-mile run to Chepachet Inn, where lunch was served, allowed the party to appreciate the flexibility and smooth running qualities of the new "six." Arthur N. Jervis and Edward F. Korbelt planned the visit in an admirable manner.

Externally there is practically nothing to distinguish the six-cylinder Berliet from the larger four-cylinder models turned out this year from the Providence factory. Its wheelbase, 126 inches, is identical with that of the 60-horsepower four-cylinder car which it supplants, the bonnet is only about one inch longer, and there is but a very small increase in weight. The new product is in no sense an experiment, well-tried Berliet lines being followed throughout in its construction. Apart from the engine, no radical changes have been made on the new model, the car having four speeds forward and reverse through sliding gear of the selective type, with direct drive on both third and fourth speeds, multiple disk clutch, final drive by side chains, force feed lubrication and four brakes on the differential and rear wheel drums.

MANAGER JOYCE TELLING HIS TECHNICAL STORY.

Naturally a six-cylinder engine differs radically from one with only four cylinders, but in designing the Berliet the differences have been reduced to a minimum. The six cylinders, cast in pairs, have 4.34-inches bore by 5-inches stroke, the same dimensions as the 40-horsepower four-cylinder engine, thus valves and kindred parts are interchangeable between the two models. The crankshaft of a six-cylinder engine is always an interesting organ, as well as one which has caused a considerable amount of careful thought on the part of the designer and constructor. In the Berliet the features are two center throws in one line, with the end throws at an angle of 120 degrees. Ignition, as in the other models, is by high-tension Bosch magneto, the cylinders firing in the order 1, 4, 2, 6, 3, 5. Owing to the diminution of the size of the flywheel, it has been possible to hang the motor a little lower without diminishing the road clearance.

In their methods of production the American Locomotive Company occupies a unique position among American automobile manufacturers. Before Berliet was known on this side of the Atlantic, the parent factory at Lyons, France, produced automobiles which were recognized as fit to stand in the front rank of European machines. At the Providence factory all work follows accurately the plans of the

A PEEP UNDER THE BONNET OF THE BERLIET "SIX."

French designers, work being done entirely to metric system to insure absolute harmony with the designers' blue prints.

Wherever imported material offers any advantage over that obtainable in this country, it is employed, the contracts between the American firm and the house under whose license they build allowing all material to be obtained from the factory or through the firm's European suppliers. It would be erroneous to suppose that the Berliet is an "assembled" car. The frame is imported in lengths, cut to size and joined up at the American works; the crankshaft is imported in the rough, camshafts arrive in the form of a steel bar, transmission gears are received in a similar condition; practically all the machining is done here on best American lines, no parts being received in a completely finished condition. Having had opportunity of observing the work on the parent machine, it is not surprising that such a high standard of excellence is set at the Providence works, the aim apparently being not to equal but to surpass, in this respect, the workmanship of the foreign car. To attain this end, every part of the car passes through the hands of the tester at frequent stages, on a plan which allows the detection of the slightest imperfections.

In addition to the 60-horsepower six-cylinder car, to be fitted with touring or limousine body, as desired, the factory will produce a 40-horsepower four-cylinder car with chain drive, and a 24-horsepower town vehicle with shaft drive, carrying either limousine or landaulet body.

# STRUCTURAL BRONZE FOR AUTOMOBILE PARTS\*

By THOMAS J. FAY, E.E.

THERE are certain parts of automobiles that cannot be well made of die-forgings or pressed steel and casting must be resorted to. In casting, strength is not so easily attained as would be the result of a die-forging process or if pressed steel parts are taken into account. On the other hand, steel castings are very prone to develop "wasters," while cast gray iron is far from a strong product and cast aluminum is, as a rule, a most uncertain quantity. It follows, therefore, that "steel-bronze" cast is a very attractive product and one to be relied upon for good castings in almost every instance, if the product comes from a foundry accustomed to turning out this class of product. True, this product requires an exercise of skill born of experience, else "wasters" may be the sole reward, but the fact is steel-bronze can be procured readily from reliable sources.

Steel-bronze, otherwise known as manganese bronze, obtains as castings with excellent physical properties, as the tests here given will amply demonstrate, and the performance of this product in service is very praiseworthy, although it is the writer's belief that the use of this product has been carried too far in some cases, as for illustration, a steel-bronze axle costs quite as much as a die-forged, chrome-nickel steel axle, whereas the latter product is far superior for the purpose, involving, as it does, work of a dynamic character. Steel-bronze is used for crankcases, gear-cases, steering gear housings, lever-box housings, thrust-block housings, pedal-shaft supports and such other parts as are not easy to produce by any but a casting process, and, barring the cost of steel-bronze, there can be no fair criticism of its use for such purposes, provided, as before stated, die-forgings of steel or pressed steel cannot be used instead.

Of steel-bronze there are two grades, one of which is for castings, while the other is suitable for die-forgings or rolled sections. As regards the die-forged product, it is not used for automobile parts for the very simple reason it is not as good as die-forgings of steel and it is more costly, and if die-forgings can be made the use of either grade of steel-bronze becomes at once superfluous. In motor boat work the steel-bronze die-forgings should serve a useful purpose, for their oxidization is a factor and electrolysis sets in under certain conditions. It follows, therefore, that, steel-bronze being a product that behaves quite decently in salt water, it is very serviceable for motor boat work in which strength is requisite if the weight is to be kept low, and it must be if speed is a factor.

Having set forth the uses to which steel-bronze can be properly put, it may be well to discuss its production and show its characteristics and its eccentricities, thereby rendering all possible aid to designers. While steel-bronze can be cast into intricate shapes and very thin— $\frac{3}{32}$  inch for motorcase walls—yet even so, care should be exercised to make all walls and connecting parts of an even thickness and radii should be liberal to avoid bunching metal at angles; indeed, the fact that the metal is approximately twenty times as heavy as a mahogany pattern can be compensated for by making the walls thin, the bosses small and the radii enough to obviate large fillets and other accumulations.

It is a little difficult to design for equal weight and equal strength, considering aluminum as an alternative, but it is not difficult to realize

- (a) double the strength as compared with aluminum for
- (b) one-half more weight than aluminum.

Clever designers can do better than this, but it requires the utmost care in designing to keep the weight well within bounds. The test records XVI., XVII., XVIII., XIX. and XX. will afford an excellent idea of just what this metal affords by way of

strength, and the chemical composition for sand casting ingots will there be found. In considering this question of design and strength, it may be well to here interject a warning, as it were. Unscrupulous brass foundries are prone to fill on phosphor or other bronze as a substitute for steel-bronze and for flywheel work this is a very dangerous thing to do.

The author has had a good deal of trouble with what was called manganese bronze—steel-bronze—but generally found such product not to be what was claimed for it, and upon procuring real steel-bronze the trouble disappeared. This product is more troublesome to make and costs more to procure, and it not infrequently happens that foundrymen labor under the impression that users do not know what they want or that they do not know the difference between steel-bronze and phosphor-bronze.

As a rule a flywheel of a good diameter on a motor designed for high speed will locate the difference, but unfortunately a flywheel in disrupting does serious damage. In any case, for this class of work the steel-bronze should be procured from some reliable source of supply. In the sand castings as compared with the die-forging steel-bronze, the difference lies in the fact that for the sand casting product aluminum is present and the zinc content is greater. In the sand casting product the aluminum plays an important part, but the presence of the aluminum defeats die-casting. Aluminum in sand castings imparts soundness, but it must be added cautiously and in small increments. The right amount of aluminum has a quieting influence on the product and enables teeming to be accomplished early and under favorable conditions. An excess of this ingredient would produce what the steel man terms "constitutional segregation," and on the whole a most unruly product.

By tracing the entectic of the product steel-bronze, it will be found that the relation of copper to zinc should be 55 to 45; that is, the best product comes from the use of 55 per cent. copper and 45 per cent. zinc. The analyses given do not show exactly this

latter name is not very appropriate, because the manganese merely serves as a carrier for the iron and the manganese is not always present excepting perhaps for a mere trace in the finished product. On the other hand, the iron is always present, and it is the iron that imparts the extra qualities, whereas the manganese, once it serves the one purpose of introducing iron to the entectic, passes off and ceases to serve as a factor.

If, on the other hand, manganese is not used at all and iron is introduced, the iron will not alloy with the copper-zinc entectic, and the iron will be found as nodules or shot in the "frozen" castings. True, manganese itself is an intensifier, but as such it is a weakling as compared with iron, and besides, the presence of enough manganese to materially influence the tensile strength would be detrimental in other ways, as, for illustration, the elastic limit would undergo a marked depression, which would be a great misfortune, for that property of steel-bronze is low enough at all events, although it is high as the same phenomenon in Bessemer steel, and that is saying a whole lot for a casting.

Tin in quite small increments has an especial advantage in that it increases and defines the elastic limit, but an excess of tin would defeat its usefulness, since the casting would become brittle and act the same as "cold short steel." The tin, then, must be added carefully as to amount, else the castings will be treacherous, and in automobiles this property must be guarded against at all hazards. The lead found in the composition comes with the zinc as an impurity of the latter. Lead is not wanted and very pure spelter should be selected, else the lead content will amount to enough to make a noticeable depression in the strength of the steel-bronze.

In the production of steel-bronze both for castings and for die-forgings or rolled sections the process is not unlike the process that obtains in the manufacture of steel, in important respects at any rate. In the production of steel, as is well understood, the ores are reduced in a blast furnace and come out as pig. This product is remelted in a converter or a furnace and is poured into ingot moulds. The ingots are then worked up into boss and shapes. Or, in the gray cast iron production, the blast furnace "pigs" are charged in a cupola and the out-pouring is run into moulds to form castings of any desired shape possible to cast. So it is with the steel-bronze, and the steel alloy, so called, which corresponds with the blast furnace "pig," must be evolved by a process, and this product, remelted in crucibles or a converter, is poured into moulds for casting if it be so mixed as to serve for sand casting, or it is poured into ingot moulds for rolling if it be mixed according to the requirements of the work.

The steel alloy, then, must at first be produced, and in this process ferro manganese is a requisite. This product holds:

**Ferro Manganese.**

Manganese.	Iron.	Carbon.
80 per cent.	14 per cent.	6 per cent.

taking round numbers for it. The impurities in this product are sulphur, phosphorus and silicon, but the percentages are small and it is not definitely known if these impurities do damage as they do in steel, even when present in minute increments.

Besides ferro-manganese, "spiegeleisen" can be used, the composition of which is as follows:

**Spiegeleisen.**

Iron, 80 per cent.	Manganese, 20 per cent.
--------------------	-------------------------

in round numbers, and neglecting again the impurities as silicon, sulphur, phosphorus and manganese.

The ferro-manganese is the most attractive and can be obtained at low cost in lumps, easily broken, and quite pure. The amount required for the purpose is but slight at all events. The iron used in this work should be pure "cement bars," preferably the Norway iron product, nor should the iron be too small, else the product will oxide away and introduce unnecessary trouble. The bars, say half-inch, cut into short strips, would serve perfectly the main point, being able to pack the crucible with as much of the

 BELONGS TO THE STEEL  
 BRONZE GENERAL.

be carefully placed, and if possible the design should be such as to render gating easy and avoid branch gates, horseshoe gates and skim gates, although finger gates are fairly good for feeding to several small castings through runners, but "plump gates" are the most desirable, since a plump gate is the most direct gate.

The foundryman is not to blame for much of the bad work, but the "goffer," or foreman, in the average foundry is not averse to shedding all blame. However, patterns are prone to evils and designs do oftentimes foreshadow bad patterns and worse castings. The trouble is that draftsmen, as a rule, do not know a "match" or "oddside," that is, a block of plaster or hard sand, in which a pattern is partly imbedded for giving shape to surfaces of separation between the parts of a mould, and one may say, a set of "monkey knuckles," which are indentations due to irregular ramming.

In other words, draftsmen do not know what to do to aid the "goffer," and as a rule a foundryman cannot draw anything, unless it is to make a "clean lift" when a pattern is drawn from a mould, and even that is only possible if designs permit and patterns have the requisite "draft" and "drawing straps," if they are needed anyway. Moulders know as much about drawings as draftsmen do about moulding, and the sum total of this knowledge would never stop up a "flue."

There is one other point about this matter that should be looked after, i. e., moulders are wont to get as much weight into a casting as they possibly can. Weight is what is paid for, not pieces. They accomplish this by "rapping" in excess of the amount required to clear the pattern, although it will be understood some rapping is necessary to afford a "clean lift." In many cases under-cut patterns, requiring, as they do, a "draw back," lead to complications and wasters, and on the whole, while the foundry has its own set of obstacles, as before stated, the drawing and the pattern can in a large measure account for the failures that beset the foundry.

Having thus, at least, intimated that steel-bronze castings, to be as good as they can be, can also go wrong much easier perhaps than ordinary brass and bronze castings, it may be well to allow space in which to further discuss the remaining steel-bronze product as used for sheets, die-forgings and rolled sections. The mixture for this product, as before stated, holds no aluminum and somewhat less zinc, or "spelter," as it is generally termed. Moreover, the copper is increased a little, so that to sum up, one would say one component is eliminated, one other is diminished and one is increased to make up the difference. The resultant mixture is practically what has long been known as "Muntz" metal, which product is generally understood to hold the components, viz.:

**Muntz Metal.**

Copper, 60 to 62. Zinc, 38 to 40.  
 Parts by weight.

For steel-bronze the steel alloy previously mentioned must be utilized and so the following would hold:

**Crucible Charge.**

Copper. Zinc. "Steel Alloy."  
 60 39 2

The mode of procedure will remain substantially as before, that is:

1. Put one copper ingot of say 15 pounds into the crucible.
2. Cover it with charcoal.
3. Bring the copper to a full red heat.
4. Add the steel alloy.
5. Stir.
6. Urge the heat until the steel alloy melts and alloys with the copper.
7. Add the balance of the copper.
8. Stir.
9. Add the zinc.
10. Stir.
11. Pour in the ingots.

brass and brass-alloying processes. It follows, therefore, that some conditions are so general as to render their application quite general.

It is reasonable to suppose, and in fact quite proper to conclude, that in general "soaking" will be to the detriment of the product. This is amply borne out by the fact that for bronzes in general the metals are melted in the order of their fusion point, i.e., the metal with the highest fusion point comes first, and the remaining components as a rule are added in accordance with their respective fusion points, so that the component with the lowest fusion temperature comes last; indeed, some products are added after the crucible is removed from the heat and just before teeming. Each product has its own especial features, and they should be observed, but the foregoing holds, in the main, and the closer the practice approaches the natural tendencies the less will be the chances of realizing poor results.

Take, for instance, the practice of using "coolers," that is, waster castings, to cool overheated crucible charges before teeming. This use of "coolers," while it cannot be set down as good practice at all, is positively ruinous in so far as steel-bronze casting is concerned. In other words, the remedy for a wrong, while it may be the best thing under the circumstances, does not eliminate all the ills that follow the perpetration of the wrong.

There are one or two other points that should be mentioned here, because steel-bronze is at least one product that will go wrong on very slight provocation. Take, for instance, the question of "deadheads." As before stated, steel-bronze will not do under numerous remelt conditions; in other words, it is not valuable as "home scrap" result. "Deadheads" are not wanted, and the tendency is to limit the sullage piece, or deadhead, as it is called, because it is not delivered to the customer and is not paid for unless the customer pays an extra pound price to compensate it.

The sullage piece, on the other hand, contains the oxides and floatage, or other impurities, and if the "head" is stopped off below the needs of the occasion the result is the oxides and impurities will be found in the casting instead of where they belong, in the sullage piece. And again, the "ingate" or gates should

## HELPFUL HINTS FROM MANY SOURCES

THERE is a prevalent idea among automobilists, says a Michelin expert, that a tire which has begun to show signs of weakness can be strengthened by putting a canvas lining over the fibre. Frequently a worn tire is shipped to the factory with instructions to renew the canvas. A moment's thought would show that such an order, which is equivalent to a request to re-make the carcass of the tire, is impossible of execution. It is possible, however, to add an interior lining, but that this would give any greater solidity or give any measure of security is an illusion.

Some years ago a canvas protector was glued to the inside of tires; but it is incorrect to suppose that this lining was added with a view of strengthening the fibre. Its object was quite different. One of the most difficult operations in the construction of a tire was to get such an assemblage of fibres that the interior of the shoe would be so smooth that it would not injure the air chamber. For a long time it was impossible to make this smooth surface, and as a substitute a lining of finely woven canvas was attached to the carcass. Progress has been made in recent years, the protective lining being abandoned as useless, as the canvas surface was given a finer finish.

With modern tires, it should be remembered that less chalk is needed than was formerly the case. The former rougher surface absorbed a large quantity of chalk, a defect which has been remedied in up-to-date automobile shoes. If an excess of French chalk is used, it will agglomerate, form a hard body and be injurious to both the air chamber and the fibre of the shoe. All that is now necessary is to dip a soft cloth in the chalk and rub it over the surface of the air chamber. It is wrong to empty a handful of chalk into the shoe, as many automobilists do, and trust to it spreading over the surface as the wheel is turned around.

### Exhaust Gases Are Becoming Purer.

So far as visible exhaust smoke is concerned, many automobilists have attained absolute perfection, said Dugald Clerk in a paper read before the Engineering Section of the British Association. Valuable experiments in this matter were made by the Royal Automobile Club of Great Britain with engines running under differing conditions. It was found that though many of the cars burned the mixture given to them in a most complete manner and evolved a minimum of carbonic oxide gas, others showed the presence of carbonic oxide in the exhaust greater than two per cent. The British Club had decided to continue these experiments later, but meantime Dugald Clerk examined the exhaust gases on his own car with the following results:

	Percentages of CO in Exhaust Gases.		
	April 23. Per Cent.	May 7. Per Cent.	July 3. Per Cent.
Engine throttle full open. Car climbing hill .....	3.6	3.6	2.2
Engine throttle less than half open. Car running on level.....	6.9	4.2	2.4
Engine running without load. Car standing .....	0.5	0.4	1.8

It is highly desirable that the exhaust gases of automobiles should contain a minimum of carbonic oxide, in view of the rapid increase of their use in large cities. In the open road, a little carbonic oxide rapidly diluted by air would do no harm, but in large cities, when horse traction is replaced almost entirely by motor vehicles, it will be necessary to look into this carbonic oxide question with great care.

### A Remedy if Your New Driving Chains Are Noisy.

When new driving chains are fitted to an old automobile they are apt to make their presence heard in an unpleasant manner, especially when climbing a hill. The reason is that the pinions on the countershaft, although they may appear to be in good condition when examined superficially, have become worn and

will not quietly accommodate the new chains. Instead of buying new pinions, as might at first suggest itself, perfect conditions can be obtained by merely transposing them, putting the left hand pinion to the right and the right hand one to the left. The forward face of each tooth has become worn through friction, but the opposite side being only occasionally used for reversing will be found to be as good as new. Transposing the pinions presents a practically new face to the new chains and suppresses all noise. The teeth of the road wheels being twice as numerous will not readily show the same defect; when in length of time they become worn also, a new surface can be obtained by changing the wheels to opposite sides of the car.

### Where Dismountable Rims Need Special Care.

Dismountable rims—which must not be confounded with the detachable types running them so close for popular favor—require certain attentions which are not necessary with the commoner kind consisting of a metal rim permanently attached to the wood felloe. An automobilist writing to *La Pratique Automobile* relates his experience as follows: A rear tire lost its sustaining air; examined at the garage, no trace could be found of nail or stone or any defect discovered in the valve. The following day another tire fell collapsed in the same way, but left indications of its

FIG. 1.—Showing valve held in position by wooden rim.

FIG. 2.—Showing necessity for care in adjusting dismountable rim.

defect. When a tire is mounted on a fixed rim the valve is passed through the hole provided for it, the tube slightly inflated, then straightened out if necessary. The thickness of the wooden rim maintains the valve in its normal position, as will be seen in Fig. 1, until it is held there by the nut provided for that purpose. The dismountable metal rim, owing to its thinness, cannot serve to guide the valve in position, consequently when the lugs are being fixed there is a danger of dragging the tube and throwing the valve out of true, as shown on Fig. 2. It is an experience well known to cyclists. When the dismountable rim is fixed on the wheel the twisted valve stem is forced into an upright position, with the inevitable result that the air chamber is strained and bursts later or is torn immediately.

### Four Sources of Light in a Single Lamp.

A quadruple lamp which should prove useful to automobilists is described in *Omnia*. It provides four practical methods of lighting: an ordinary carriage candle, held by a spring; gasoline by means of a Pigeon safety lamp; acetylene, by inserting a burner; electricity by butting in a small bulb. Each of these four can be slipped into position without the use of any tools or any adjustments whatever. The lamp is strongly constructed in brass and guaranteed not to blow out in any wind.

### How to Fix That Troublesome Little Nut.

The automobilist who is troubled with nuts that will work loose despite the frequent use of a key need not search far for a remedy. Paint the end of the thread or drop on a little varnish and the small annoyance will be at an end. A single drop of solder will be equally effective. To slacken the nut a little extra force will have to be used, but it is not sufficient to cause any damage to either the nut or the thread.

"PARTY CAR" CONSTRUCTED BY A MASSACHUSETTS DEALER.

### NEW SOURCE OF PROFIT FOR GARAGE KEEPERS.

That there are other methods of increasing the income beside that derived from selling and repairing cars does not seem to have occurred to the majority of garage keepers. Most of them do more or less renting business, to be sure, but W. H. Marble, of Brockton, Mass., who handles the Winton, Locomobile, Cadillac and Columbia cars in his district, seems to be one of the first to realize the possibilities of a sightseeing car as a source of profit. He calls it a "party car," which is probably a far more apt designation for it in a small city, and the photograph gives an idea of how successful he has been in building one for himself, as it is his own work. It is provided with a four-cylinder vertical motor, rated at 40 horsepower, and on a recent trial trip made 82 miles at a good rate of speed without a stop for repairs or adjustments.

The transmission consists of a planetary gear and Mr. Marble has introduced an excellent feature by providing a special clutch between the motor and the gear, so that when the motor is running with the car standing, the gear is idle, thus eliminating the noise and attendant wear on the gear. The wheelbase is 13 feet and the length over all 17 feet 6 inches. The ignition is of the high-tension type, while the lubrication is taken care of by a Hill Precision oiler. Five seats are provided, and these, in addition to the driver's seat, give it a capacity of 22 passengers. The car was designed and built for renting, but it has worked so well and come in for so much favorable comment that Mr. Marble will probably build duplicates of it to order.

### CONSIDERS WOMEN MOST CAREFUL DRIVERS.

John W. Haynes, well known as a driver of racing cars, and the assistant sales manager of the Dragon Automobile Company, has the following to say about the driving of cars by women:

"I have observed that women who learn to drive cars are as a rule exceptionally capable after they have mastered the mechanical details of the work. It is true that they are not as daring as men in all emergencies, but this, to my mind, is rather a recommendation than a drawback. Most men take too many chances with cars. Judgment may be good with them nine hundred and ninety-nine times, but the thousandth chance taken is apt to be their downfall.

"A woman does not take chances, and she brings her car and its human freight home without damage. None of the accidents which the newspapers "play up" with inch-long headlines occur when women are driving. Someone recalled this fact the other day when a number of experienced drivers were discussing the subject and a veteran of the industry who was there remarked that not only was this true, but it had been his experience that the cars which he had sold for women to drive had been the subject of less repairing than those which were driven by men, particularly by professional chauffeurs. One reason for this, he thought, was that women did not try experiments with cars. When the cars were running well they usually let them alone. This, he thought, was an exceedingly desirable trait."

### ONE MAKER ON SEALED BONNET TESTS, ETC.

"I cannot see," says Henry Ford, "what is proved by a contest in which the bonnet is sealed, but the drip pan may be removed so that practically any operation can be performed except actually taking the motor apart and reassembling it. Tests in which no account is taken of adjustments made or parts replaced can have no real value in the eyes of practical men—and any person who has driven a car one season cannot be misled very far in such matters. Seems to me these stunts which are so much in favor just at this time belong to the same category as those fool photographs showing a car submerged in a stream so that the carbureter must be full of water and the ignition system so drenched it will be out of business for several hours. Such pictures fool no one so much as the persons who go to the expense and trouble of taking them—and cleaning the carbureter afterward.

"The only test that tells anything is one in which the rules are such that only one car can win, and where the element of chance is reduced as much as possible. Many cars of indifferent quality run for weeks without adjustment of any kind, and a sealed bonnet would not alter the conditions or the result; while, on the other hand, the best car ever made may call for adjustment at any moment—it's all a matter of 'chance, accident and circumstances,' as Colonel Ingersoll used to say."

### THROUGH ACRES OF CORN AND TOBACCO.

WASHINGTON, D. C., Sept. 1.—Within a radius of 50 miles of Washington are many interesting and picturesque one-day tours, but these have become so familiar to Washington automobilists that a new short tour has long been sought. It has remained for Wallace C. Hood, manager of the Motor Car Company, local agents for the Peerless, Thomas, and Stevens-Duryea, to blaze a new tour. It is to Chesapeake Beach, located on the shores of Chesapeake Bay, some 40 miles from the National Capital, and while it is a strenuous trip, the scenic features en route will more than compensate those who may make the trip.

Good roads are encountered until Upper Marlboro, Md., is reached, this point being about half way. From there on to the beach the roads are very sandy and in some places are so narrow that two cars could not pass each other if they happened to meet. The soil is very rich and many acres of corn and tobacco, the staple products of the region, are passed. There is plenty of woodland and a number of streams, together with quaint old colonial houses and rail fences, to add to the picturesqueness of the scenery, which is prevalent in Anne Arundel county, where the old well shown in the photograph is located.

A 45-horsepower Peerless touring car was used in making this trip, and as it was the first automobile that had ever been over the road between Upper Marlboro and the bay, the car and its occupants naturally attracted much attention.

THE PEERLESS HALTS NEAR THE "OLD OAKEN BUCKET."

# LETTERS INTERESTING AND INSTRUCTIVE

## WHY EQUALIZER SPRINGS ARE NOT USED.

Editor THE AUTOMOBILE:

[880.]—Will you kindly advise me the reason why equalizers are not used to absorb road shocks when a car is equipped with semi-elliptic springs? They are in successful use in railroad services on cars that are equipped with only four wheels. A SUBSCRIBER.  
Watertown, S. Dak.

Apart from certain structural difficulties in the application of this type of suspension to an automobile, the rear wheels of which have to take the driving effort while the front wheels are steering, there are radical differences in working conditions which make the equalizer unsuitable for other than railroads. Running on a rigid steel bed of unvarying surface, the springs of a railroad carriage are only required to absorb a minimum of vibration and their deflection is kept within well defined limits. The effect of the equalizer is to distribute a vibratory wave over a larger area, thus reducing the disturbing movement communicated to the suspended vehicle. Practically the equalizer

SKETCH OF THE EQUALIZING ARRANGEMENT PROPOSED.

amounts to a three point suspension, and as such gives good results when used under fixed conditions. In the automobile the problem is entirely different, the springs working under much more strenuous conditions, frequently on bad roads and at high speeds being called upon to furnish their maximum deflection. To put it in a simple manner the equalizer would be too good for the rougher work of an automobile; road shocks, which under the standard system of independent springs can be absorbed by the one spring receiving the shock, would be distributed over the entire chassis, causing an excessive oscillation injurious to the driving mechanism and dangerous for the stability of the car. The crux of the matter lies in the differing conditions under which the two classes of vehicles work, the railroad carriage being subject to short vibratory waves and the automobile having to withstand sudden shocks and lateral thrusts communicated not only to the body, but to the driving mechanism. To apply this method of suspension without redesigning the entire automobile would, as can readily be seen, result in considerably shortening the wheelbase for a given length of body, a change which would not be beneficial to the life of the engine or the comfort of the passengers, as everyone is aware who has made comparisons of the ease of riding on a well-centered body and one in which the seats extended far behind the center of the springs.

## INFORMATION ON SOLDERING ALUMINUM.

Editor THE AUTOMOBILE:

[881.]—Will you kindly let me know at your earliest convenience in which issue of your Journal I can find your solution for soldering aluminum? And oblige,  
C. L. SCHAEFER.  
378 East 161st street, New York City.

A solder which will work well with aluminum is: Tin, 10 parts; cadmium, 10 parts; zinc, 10 parts; lead, 1 part. The pieces to be soldered must be thoroughly cleansed and then put into a bath of strong solution of hyposulphate of soda for about two hours before soldering. Another solder may be formed with 80 per cent. tin to 20 per cent. zinc, using a flux composed of 80 parts stearic acid, 10 parts chloride of zinc and 10 parts chloride of tin. An announcement of a specially prepared aluminum solder appearing on advertisement page 80 of our issue of August 22 may be of interest to you.

## ADVANTAGES OF INCREASING WHEELBASE.

Editor THE AUTOMOBILE:

[882.]—We would be pleased to have you tell us through your columns regarding a long and short wheelbase. Suppose you had two automobiles, each equipped with the same machinery, such as engine, transmission, and so forth, but one was of 100-inch wheelbase and the other was of 96-inch wheel base, the weight of both machines being the same. Now the question arises, which machine pulls the hardest?

In other words, does a long wheelbase require more horsepower than a short one, considering horsepower and weight the same in both cases?  
CRESCENT AUTO & SUPPLY CO.

St. Louis, Mo.

Less horsepower is required to move the same weight of car over uneven surfaces when distributed over a long wheelbase than a short one, for obvious reasons. When striking an obstruction, a car with a short wheelbase is usually lifted bodily in the air, which causes it to lose a great deal of its momentum and this lost energy must be made up before the car can attain the same speed as it was running at before striking the obstruction. It is as if the short wheelbase car tried to batter down everything in its way while the long wheelbase car glides over it easily by reason of the interval elapsing between the time the front and rear wheels strike the same point. Such a slight difference as you mention would hardly be appreciable, and it could not properly be stated that one machine pulled harder than the other; merely that the long wheelbase machine would be able to make much better speed, particularly over rough roads, with the same amount of power as employed in the shorter car.

## "AUTOMOBILE" SIGNIFIES "SELF-MOVABLE."

Editor THE AUTOMOBILE:

[883.]—Kindly advise me in the next number of "The Automobile" the meaning of the word "automobile" and its origin. Does it cover all classes of road vehicles, propelled by a motor or engine?

By answering the above, you will greatly oblige,  
New Durham, N. J.

R. DUNCAN HUNTER.

Probably you have searched in vain for the word automobile in a standard dictionary of the English language. To get the word's correct dictionary value one must turn to a French volume, for the word, like the thing it represents, comes to us from across the Atlantic. Primarily the word is an adjective, there never being any record of its use as a noun until the last few years. Its derivation is from the Greek *auto*, meaning self, and the Latin *mobilis*, movable. When the motor vehicle first appeared it was called in France a *voiture automobile*, or an automobile carriage. In time the word *voiture* ceased to be used in connection with automobile, the adjective passing into the French language, and later into the English, as a substantive. Etymologically to speak of a vehicle as an automobile is incorrect; we should say an "automobile vehicle," carriage, wagon, etc. Few of us, however, will be willing to employ the double term of the etymologist when the idea can be so well represented in a single word. "Automobile" may be taken to apply to all classes of self-moving vehicles of a great many different types.

## WHY NOT SLEEP IN THE TONNEAU?

Editor THE AUTOMOBILE:

[884.]—Will you satisfy my curiosity and desire for information on the following subject?

Being an enthusiastic believer and user of automobiles and much interested in touring, even under the adverse conditions encountered in many parts of the South in the way of sandy roads, I have often thought why, in the construction of touring cars, couldn't the back of the front seat be securely hinged so as to swing backwards and down, thereby with a few fittings quickly converting one's car into an "impromptu Pullman sleeper" for the accommodation of at least two persons? Such sleeping facilities while on the road would, in many instances, be far preferable to the best that many country houses, and so-called inns, could furnish. Even in in-

clement weather, with the automobile fully equipped with top and an ample curtain protection, two tourists could spend the night within the curtains of the auto far more comfortably than in many camping tents.

I do not know of any cars thus equipped, nor of any reasons that would prevent a car being built in this manner, so am led to write you as above, under your department "Letters Interesting and Instructive." I would be glad to know whether you consider my idea worthy of comment in your paper, and if you think it practicable.

WALTER SPRUNT.

Wilmington, N. C.

This has been done in the case of one or two cars that have been used on long tours, while others have fitted their cars quite elaborately in this respect, one used for a hunting trip having accommodation for four persons. If there were sufficient demand for them, doubtless such bodies would be turned out in quantities, but as it is, recourse must be had to the carriage-maker and the individual ideas of each owner embodied in his creation. The idea is perfectly practical.

### ALTERING THE FRONT SPRING SUSPENSION.

Editor THE AUTOMOBILE:

[885.]—The photographs which accompany show how my Ford car looks after I changed the front spring suspension. As a result of the alteration the wheelbase has been increased by fifteen inches, and I can safely assert that the car rides fully fifty per

FRONT AND SIDE VIEWS OF THE SUSPENSION IMPROVEMENT.

cent. easier. Any Philadelphia owners wishing to make a similar change in their cars can write to me, and I will gladly furnish them full particulars, showing them how to improve their cars as I have done.

S. H. CROFT.

Philadelphia, Pa.

### SOME QUERIES ON MISCELLANEOUS TOPICS.

Editor THE AUTOMOBILE:

[886.]—Your answers to the following questions will oblige a constant reader:

1. Why could not the spark be advanced automatically; i. e., by a centrifugal governor, and the engine control be by throttle alone? What are designers' objections to this method?
2. What is the cause of the hum in high-class American and foreign cars? I do not mean the noise caused by the chains, but the humming sound which seems to come from the engine.
3. What is meant by "1-8 inch female thread?"

C. M.

Chicago, Ill.

1. This has been done in a number of cases and probably there are still cars built that embody this feature. So far as we know, there is no objection to it, either theoretically or in practice. It is simply one of those superfluities that introduce needless complication, particularly as very few cars nowadays are fitted with a governor of any kind. Moreover, with the magneto, which is daily becoming more and more prevalent as a means of ignition on both American and foreign cars, there is very little need of altering the position of the spark lever, except to start.

2. The high speed at which the flywheel turns is doubtless responsible for the hum you mention, although the fan is also a contributing factor. Any body revolving at a very rapid rate will give rise to it and it is particularly noticeable with electric motors.

3. The dimension, " $\frac{3}{8}$  in.," refers to the diameter of the tube, pipe or other part in question, while "female thread" means that it is threaded internally instead of externally.

### THE GREASE THAT TRACY USED IN 1905.

Editor THE AUTOMOBILE:

[887.]—Some time during the fall months of 1905 I purchased a ten-pound can of gear case compound for lubricating sliding gears. I found it very good, and want more of the same stuff. I don't remember where I got it or what the name of it was. Can you help me out? I saw the "ad" for the stuff in "The Automobile," and I remember the "ad" said that the compound had been used by Tracy in the gear case of the Locomobile in the 1905 Vanderbilt race. I want more of this lubricant, and want it bad, and if you can give me any information through your "Letters Interesting and Instructive," you would greatly accommodate, C. L. WEIMER.

Lebanon, Pa.

Mr. Tracy advises us that so far as his memory serves him he used Albany grease on his Locomobile racer in the 1905 Vanderbilt Cup race. The address of the makers of this lubricating compound will be found in our advertising pages, though it is probably kept on sale by all supply stores and garages.

### BOTH MAGNETO AND CARBURETER AT FAULT.

Editor THE AUTOMOBILE:

[888.]—Probably you will recall my writing of a very annoying form of trouble that I experienced with my car for some time last season, and which I tried in vain to remedy, even to the extent of calling several alleged automobile experts to my aid. These gentlemen are more or less well known, so I will refrain from mentioning any names. They came, saw and looked very wise. One brought an assistant with him and spent two days in tearing the car down and putting it together again, and then departed. The other contented himself with making sundry suggestions, running the car about and looking wise, in the course of which he almost succeeded in making mince meat of a bob-sled full of children who were coasting down a hill. He continued to look wise, but likewise departed without having left anything of definite value behind in the way of a diagnosis, though I will add that neither of these experts has ever sent me a bill of expenses for his valuable services.

Later on I had an old friend who is an automobile engineer come to look at the car, and he determined almost immediately that the ignition was at fault. The four-volt storage battery with the jump spark had never given satisfactory service, as compared with the make and break, and he found that on setting the magneto gear three teeth ahead a very much better spark was obtained. He then devoted considerable time to adjusting the spring on the auxiliary air intake of the carbureter, accomplishing this by running the engine slowly and holding his hand over the inlet, gradually removing it so as to give more or less air; then speeding the engine up and doing the same thing. For instance, if he found the engine ran better with his hand away from the inlet, it indicated that more air was required, and the spring was adjusted accordingly. He finally got the car so that it ran very well except that it "bucked" when the throttle was opened suddenly.

He advised me to try a Schebler carbureter, stating that his company had had excellent results with it, and I finally bought a 1-inch size and put it on. Have had absolutely no trouble since, the car running as well as it ever did. The fault would seem to have lain, therefore, in the fact that the engine did not get a hot enough spark from the make and break; and secondly, that it did not have the proper mixture. My friend examined the valves carefully and found that they were set correctly, so that the only place to look for the trouble lay in the ignition and carbureter, both of which were found to require adjustment.

W. E. I.

Passaic, N. J.

# Autoing Across New Mexico's Plains

By  
C. W. Fletcher

WHERE THE ROAD ACROSS THE "LLANO" RUNS STRAIGHT AS THE PROVERBIAL CHALK LINE.

ROSWELL, N. M., Aug. 22.—Persons living within a radius of 200 miles of great cities, where hard roads, interurban trolley lines, and fast passenger train service are commonplace incidents of everyday life, can scarce appreciate just what the automobile is doing in the upbuilding of the great Southwest country. In the East one is accustomed to associate the auto more often with social life than with business, but how it is answering the call of duty in the sterner and less complex civilization of New Mexico would be an eye-opener to readers of *THE AUTOMOBILE*, could they but see for themselves.

Away down on the semi-arid, mesquite-covered plains of New Mexico the whir of the motor startles the antelope and the prairie dog. Its coming, however, is the result of no chance or accident. This is a daily event—the flight of the Roswell motor stage—and you may easily picture the contrast to the days of the overland stage and the pony express. Across this dry, barren stretch of country from Roswell to Torrance, two thriving towns in the irrigated section, is 111 miles. The automobile stage makes the round trip in 11 hours and 30 minutes, actual running time. J. F. Stockard, Mayor of Roswell, was a believer in automobiles. He conceived the idea of establishing the stage line running between the two towns, but he was told that such a thing would be impracticable. How often has that advice proved untrustworthy where the automobile was a factor!

But here was the situation that confronted Mayor Stockard. The main line of the Atchison, Topeka and Santa Fe system goes over the Raton mountain range 150 miles north of Roswell. To go from any point on the main line of the Santa Fe to any point in the Pecos valley of New Mexico one must journey as far east as Trinidad, then cross the plains to Amarillo, Tex., and then go southwest on the Pecos valley line. It is a day's journey from Amarillo to Roswell. Mr. Stockard's motor stage line bisects this big railroad triangle. Its terminus is Torrance, where it connects with the Santa Fe Central line. It reduces the time necessary to make the journey from Roswell to Albuquerque more than twenty-four hours. A corresponding reduction is made in the time required to make the journey to other points in the territory.

"Our line was started in November, 1905," Mayor Stockard said a few days ago. "We made our own roads with the use of a drag—a plow-like arrangement that cut out a path twelve inches wide for the wheels, leaving an unbroken strip of ground in the middle of the road. We are now oper-

ating six cars—four Buicks, one Winton, and one car we manufactured ourselves. In May this year we handled 247 passengers and in April 184. The average cost of operating a car over the line is \$12 per round trip. The fastest time we have ever made from Roswell to Torrance, a distance of 111 miles, is 3 hours and 45 minutes."

At the suburbs of Roswell the chauffeur turns abruptly from the public road. The big machine goes slowly over a curiously constructed fence-row crossing. It is built on the plans of a railroad cattle-guard, except that where the steel rails are laid on the railroad crossing there are on Mr. Stockard's unique crossing grooved runways, upon which the wheels of the automobile run in making the crossing. Across the sand-swept, mesquite-covered lands, which stretch away for an infinite distance, Mr. Stockard has laid out the road as "straight as the crow flies." There are few curves and but few depressions to bridge. One of the largest is seventy-five feet across. It is spanned by a bridge built by Mr. Stockard. It, too, is something new in the automobile bridge line, and was illustrated and described in *THE AUTOMOBILE*, August 2, 1906, page 137.

Fifty-four miles from Roswell is the half-way house, where Mr. Stockard maintains a free hotel for his patrons. The ride is for the most part across a desolate, dreary plain, here and there a tract of ground in cultivation, or perhaps a ranch house to relieve the monotony of sand and mesquite brush. It's a cool, invigorating ride, however, except where the sun beats in on unprotected face and hands.

It's only after you've made the trip over the line and seen the country that the significance and the utility of the automobile as a means of transportation come home to you. Comfortably seated in the tonneau of one of the cars, you may figure on the schedule with the same assurance that the passenger on the fast railroad train from New York to Boston enjoys. A car operated in this country seems to catch something of the spirit and atmosphere of semi-desert land—if that were possible. At any rate, these same engines whir and thump over the trail in an unfaltering manner, day after day, the year around. Ask a denizen of the Pecos valley country about the automobile, and ten to one he'll reply, "Ever ride on the Roswell stage?"

Next time you go auto riding through the park, remember what the automobile is doing 'way down in New Mexico, and rejoice that you are an automobilist.

BRIDGES THAT SPAN THE WIRE FENCE ROWS.

STEAM\_RACER'S STARTLING CONCLUSION OF THE 1907 ORMOND-DAYTONA MEET.

**T**WELVE months after any important automobile race even the most diligent search fails to account for all the machines which aroused the enthusiasm of the public by their mighty bursts of speed. There is always a certain proportion of dead and vanquished, diminishing considerably in recent years, and a number which sneak away to the factory never again to breathe the pure air of the highways. Even those that finish the public test in perfect health and condition are forgotten of the public in a few short weeks, and are frequently strangers to their maker, hard pressed by more modern problems, at the end of a few months. Rich enthusiasts snap up the victors and hie away with them to distant parts of the world; some are dismantled, parts being used for building later machines, and some lie idly around the factory, pointed out to an occasional visitor as the machine which did such and such a record.

The chief French factories could, unitedly, produce a small battalion of discarded racers of every conceivable nature, some of them fit for service, others a mass of junk. Renault Frères, for instance, make a point of not selling their racers, and in one corner of the Billancourt factory can be found the machine with which Szisz captured the Grand Prix, the trio which carried the firm's colors in the Gordon Bennett of the preceding year, and this year's team built specially for the Grand Prix.

#### They's Flyer Now Carries a Russian Potentate.

Where is the powerful, regular Richard-Brasier with which Théry astounded the world by winning four successive contests against fearful odds? For a time she was on exhibition in the firm's store on the Avenue de la Grande-Armée. But even a Gordon Bennett winner is only a seven days' wonder, and the blue monster was withdrawn to make place for a more brilliantly-polished specimen. A letter from Rome, under the signature of the Count Soldatenkow of the Russian Embassy, indicates that he is the present owner of the racer, that he has just used it for a long journey from Paris to Lyons and Monte-Carlo, Aix-les-Bains, the crowded Corniche, dusty Genoa, and the still dustier Italian roads to Rome. A crowded bridge and rather too much speed resulted in the demolition of a wall and the Gordon Bennett radiator. The accident did not prevent the journey being continued and a record obtained at the Verona meeting. One of the companion engines is reported to have been used in the

as a runabout. Other Brasier racers are doing daily service in Austria, Russia and France, it always being the policy of the Brasier firm to sell their machines immediately after the race in which they took part.

#### England Took Darracq's Masterpiece to Its Leafy Highways.

The eight-cylinder Darracq, the fastest gasoline car in the world, is of too recent fame to cause any difficulty in searching for it. After Heméry had driven it in France and Florida, it went back to the factory, and was later sold to Lee Guinness, the British millionaire brewer, who takes it out for an airing in some hill climb or kilometer test from time to time. We believe that it is not true that he uses it as a week-end runabout. British ideas of speed on the national hedged-in highways are somewhat conservative. The Darracq racer with which Heméry secured the Vanderbilt Cup for France for the second time is now doing runabout service with S. B. Stevens, of Rome, N. Y. Wagner's Vanderbilt Cup winner was modified to suit the conditions of the German Emperor's Cup race and has competed in several European races this year. Frequently a prominent racer is called upon to submerge its identity in the new season's product, manu-

RESCUING A BRASIER RACER FROM A WATERY GRAVE.

facturers finding it more profitable to perfect some defective organ or strengthen some weak point than to build an entirely new model.

#### Some Doings of America's Foreign Legion.

In the last Gordon Bennett race on the Auvergne circuit, America had three representatives, a couple of Pope Toledos and Joe Tracy's Locomobile. Herbert Lytle's machine, which had the honor of being the first to officially finish in any European international contest, was driven by Dingley in the Vanderbilt race of the same year; later it was put on a runabout chassis and is now ending out its days about the factory. Dingley's Pope-Toledo Gordon Bennett racer has had a more varied career. After its return from France it was converted into a track racer, figured in a number of local events, and appeared nightly on the stage of the Broadway Theatre in "The Vanderbilt Cup." Lytle's 1906 six-cylinder Vanderbilt racer has been condemned to the more unemotional work of driving a motor boat in New Jersey. Tracy's 1905 Gordon Bennett Loco is still in existence, though parts of it have been used in the construction of the Locomobile Company's 1906 machines. It is, however, in such a condition that it could be put into shape for running in a very short time. The two 1906 Locomobile Vanderbilt racers have been visiting shows in various parts of the country. One of them was used by Mr. Tracy as a runabout from the time of the race until January last. Their racing days are not yet over, for should there be another Vanderbilt race both machines would be put into commission for the event.

America's Irish Gordon Bennett racers have not had a long life of usefulness. The engine of the Peerless, which E. P. Moore drove on the Emerald Isle, was placed in the Green Dragon No. 1 and driven in a number of track events by Barney Oldfield. At the St. Louis meet of August, 1904, Oldfield, as will be remembered, crashed into the fence with such disastrous results that it was not thought worth while to reconstruct the flyer. The Winton machines driven by Alexander Winton and Percy Owen in the Irish event had an even shorter career, being sent to the factory after the race and never leaving it.

#### Henry Ford's "999" a Pensioner in California.

"999," which once held a world's record, and often fascinated the public by its remarkable speed, is vegetating in Los Angeles or Santa Barbara, Cal., in the hands of some private owner whose name cannot be found on any records. When Tom Cooper sold "999" it passed entirely out of the hands of the Ford company. "999" was remodeled, but has not been credited with any sensational performances since rebuilding, the reason being, says Mr. Ford, that the weight of the car was nearly doubled in the improving process.

When the Stanley steamer hurled itself to destruction in the closing act of the Ormond-Daytona meet of the present year the grande finale was reached in short-distance automobile sprints. In its own special field the Stanley was king; second after second had been stripped off world's records; gasoline admitting defeat on mile and kilometer courses. Marriott opened out the powerful engine for a final sprint, the fastest the world has ever seen, in the opinion of all eye-witnesses. It proved to be the last, and when the wreckage had been gathered up Stanley declared that there would be no successor.

#### Marine and Aerial Service for Panhard Engines.

A diligent search fails to record many traces of the big fleet of Panhard racers, which ever since the introduction of automobiling have shown themselves worthy competitors. Panhard-Levassor's of early 1892 are still to be found as cherished relics in certain corners of Paris, but racing models of the machines most famous for their longevity are rare. The world's motor boat record, it is interesting to note, was secured this spring at Monaco by a couple of motors which commenced their road career on two Grand Prix 1907 racing machines. The automobile which won

OLD GOBRON WHICH WILL NOT LEAVE RACING RANKS.

the Paris-Bordeaux-Paris race of June, 1895, is still in existence in Paris. A Panhard "racer" of the middle ages of 1892 is also in the possession of a satisfied Parisian. Its public appearances are now confined to state occasions. But a few days ago France's first military steerable balloon sailed out to Rambouillet to pay an official morning visit to President Fallieres, waiting in the grounds until the return was ordered with the docility of a well-groomed automobile. It was a 70-horsepower Panhard motor, formerly on a racing car, which drove the first unit of the nation's aerial fighting fleet.

#### Gobron Five-Year-Old Still Running in Public.

A good example of long racing service is to be found in the Gobron-Brillié which ran in this year's Grand Prix. The machine figured in the Château Thierry hill climb of 1903, took part in the last Gordon Bennett, in the 1906 Grand Prix, and, despite its four years' active service, was considered capable of competing with machines of the present season without any material changes.

The Packard Grey Wolf can equal the French machine for longevity. Produced in 1903, it figured in numerous race meets, sometimes with unrehearsed effects, was sold to E. H. R. Green, of Terrell, Tex., entered in several races, went through a fence and was sold to Seth Miller, of Dallas, Tex., who converted it into a runabout. Latest reports are that it is still in good health and performing regular service.

Mercedes machines, like the successful Brasier racers, have nearly all been sold to private owners. Jenatzy's racer, with which he captured the Gordon Bennett Cup in Ireland in 1903, was destroyed by fire at the Canstatt factory, together with its

VETERAN "999" IN THE HEYDAY OF ITS YOUTH.

A CHECK, BUT NOT FINALITY, IN AN ITALIAN'S CAREER.

team mates. The machine was at that time the property of the late Clarence Gray Dinsmore. One of Mr. Dinsmore's many Mercedes racers was sold to the German Emperor, in whose service it still remains. Probably on a close search many of the earlier racers of the pioneer German firm could be found in private service, a racer of 1900 being a sober tourist of 1907. As the power of racing automobiles has increased it has not been so easy to convert a flyer into a tourist; thus specially built machines for such events as the Grand Prix or Vanderbilt races are obliged to remain in racing ranks.

Fiat racers have not generally done other than speed work. Lancia's Gordon Bennett racer, with which the dashing Italian ran such an exciting contest against Thery's Brasier, finished that memorable day disabled on the brow of a hill in wild Auvergne, while the Frenchmen yelled their victory all night long in the town down in the valley. It was Nazzaro's machine, second in the last Gordon Bennett race, that Chevrolet reduced to a shapeless mass while training on the Vanderbilt course one foggy morning in 1905. The substitute machine which he handled in the race also received rough treatment, but not such as put its life in danger, for it is now in runabout service with Mr. Barron of Boston. All the 1906 Fiats which came here for the Vanderbilt race went back to the factory, among them the one from which Dr. Weillschott took his record flying jump, and have been used to prepare for this year's European races.

### Ill Luck Often Shortens Promising Careers.

There is some pathos attached to the C. G. V. which Girardot constructed so carefully and tuned up so conscientiously for the Auvergne race. During the French elimination trials two front tires burst simultaneously on a straight stretch. Girardot was carried off to the hospital apparently a complete wreck, and his machine left by the roadside in no better condition. A strong constitution enabled the man to recover and mechanical skill put the machine in racing trim once more. It was entered for a race; Girardot, on crutches, hobbled up to the starting line to watch his favorite make another rush for glory. The driver was nervous; he raced his engine and threw in his clutch, causing the machine to jump ten yards and fall like a log. Something in the nature of a sob escaped Girardot as he turned around and, with drawn features, shuffled away from the scene of the disaster. The wreck is still at the factory.

No one who saw Christie's front driver after it embraced the telegraph post on Long Island would have imagined that there was any more life in it. But there was. The cylinders were used for the new machine which, after a too brief tuning up on Long Island, was shipped across the Atlantic to join its voice in the international concert on Dieppe's fast circuit. Brighton Beach has since seen a record sprint by the Christie; probably numerous other tracks will be the scene of its wild flights before the 1906 cylinders cease to inhale explosive charges.

## THE NEWS FROM TENNESSEE.

CHATTANOOGA, TENN., Aug. 31.—Prospects were never brighter for a flourishing season than they are now for the season of 1908. The roads of Hamilton County have been greatly improved within the last few months, thus giving Chattanooga autoists many miles of perfect roads, in addition to the fine Chickamauga Park and Missionary Ridge boulevards. The livery business is flourishing, as a great many tourists passing through the city desire to see Lookout Mountain, Missionary Ridge and Chickamauga Park.

While the present trouble with the Georgia officers in regard to the strict Catoosa County speed law was at its height many Chattanooga automobile owners did not go into the "Cracker State," but toured north on the beautiful Daisy road, through Daisy, Soddy, Retro, Sail Creek, Graysville and Dayton, a distance of fifty miles, the round trip being a good day's run.

We have six automobile companies in the city at the present writing. The two largest are the Chattanooga Automobile Company, handling the Franklin and Cadillac, and the F. G. Joyce Automobile Company, handling the Buick and Thomas.

The chauffeurs of Chattanooga are organizing the Chattanooga Automobile Chauffeurs' Association, which is expected to benefit the chauffeur and the owner, as it will not admit an unreliable man to the order nor work on a car driven by a man that is not a member of the association. The association will ask garage owners not to allow storage to a car driven by a "scab."

A single-cylinder Cadillac runabout recently surprised Chattanooga autoists by making the ascent of Walden's Ridge, partly a 15 per cent. grade and a distance of nine miles, at noonday with two men, one weighing 200 and the other weighing 140 pounds, in 39 minutes, the best previous time having been made by a large 20-horsepower air-cooled car in 36 minutes. E. W. Forstner, demonstrator for the Chattanooga Automobile Company, agents for the Cadillac, drove the car.

### WHAT THE DUST TRIALS BROUGHT OUT.

LONDON, Aug. 29.—A further claim for the public support of Brooklands track has been made by the dust trials held there under the auspices of the Royal Automobile Club. It was only through the possession of a private ground of this nature that such accurate and valuable information could be produced.

With commendable promptitude the judges in the Dust Trials of the R. A. C. have got out their report. In this test a portion of the Brooklands track was covered with a half-inch layer of fine limestone powder and some 150 photographs were taken of the clouds raised when the competing cars ran over this prepared surface at a fixed speed. In the section for makers' cars of standard design the prize of a silver cup has been awarded to F. Coleman's 30-horsepower White. In the second class, for amateurs' cars, a 20-horsepower Stanley steamer was considered least offender. A third section comprised experimental devices, and these will be further examined before the awards are made. Not as much positive data as expected has been obtained from this trial, the only undoubted fact being that high construction with big road clearance effectually lessens the amount of dust raised, a belief supported by the above-mentioned success of the two American cars, which are, of course, much higher built than are British productions.

### WHAT THE AUTO MEANS TO A POPULAR RESORT.

As an indication of the influence of the automobile upon the patronage of a well located and popular resort, it is stated that 324 automobiles Sunday last visited the Chateau des Beaux Arts at Huntington, L. I. This ideal resort, conducted by the well-known Bustanoby Brothers, was only opened early in the summer and it is yet to be entirely completed. Other resorts in the vicinity of New York report a gradually increasing number of automobile visitors, but the chateau seems to hold the record.

## SEPTEMBER FINDS CLUB LIFE ENERGETIC

### A GOOD ROAD AND LEGISLATIVE CONVENTION.

SPRINGFIELD, MASS., Sept. 1.—Arrangements for a convention to be held under the auspices of the Springfield Automobile Club in this city, September 24-25, are being perfected, when good roads and a sane use of them by autoists, and the plan of uniform registration of cars, will be the principal subjects for consideration. Efforts are being made to secure the attendance of delegates from all the automobile clubs in New England, New York, New Jersey and Pennsylvania, and invitations have been sent to the various State highway commissions. Individual owners of automobiles are also invited to attend. The Springfield club hopes to make the convention an annual affair.

The convention will be called together in some large hall to be selected on Tuesday of convention week, when papers will be read by the chairmen of the various State highway commissions, after which there will be open discussion of the papers presented. The matter of uniform legislation will also be considered. Tuesday evening a banquet will be tendered the guests, and on Wednesday the visitors will be shown the city and suburbs in automobiles.

Congressman Gillett has been invited to address the convention on national legislation for automobiles, and other prominent public men will speak on the same subject. Other speakers on special subjects will be William E. McClintock of the Massachusetts State highway commission; Paul D. Sargent, State highway commissioner of Maine; A. W. Dean, State engineer of New Hampshire; J. W. Votey, State highway commissioner of Vermont; John H. Edwards, Rhode Island highway commissioner; John H. MacDonald, State highway commissioner of Connecticut; E. C. Hutchinson, commissioner of public roads of New Jersey; Joseph W. Hunter, State highway commissioner of Pennsylvania; and State Engineer Skene of New York.

The members of the various State highway commissions have all been invited to attend the convention and participate in its deliberations.

### ST. LOUIS OWNERS' RELIABILITY RUN.

ST. LOUIS, Sept. 1.—What promises to be the most interesting run of its kind ever attempted in the Mississippi Valley is scheduled for September 21, under the auspices of the Automobile Club of St. Louis, with the title of the First Annual Owners' Reliability Tour. Start will be made at 10 o'clock in the morning on Lindell boulevard in front of the St. Louis club, and the route will be out the boulevard through the most picturesque roads of St. Louis county and over the best highways in a circuit of 86 miles which finishes at the starting point. It is the purpose of the committee to make the run a pleasure tour, so that contestants may be accompanied by members of their families. Professionalism will be eliminated and a commercial contest will be avoided. The prize to the winner will be a beautiful trophy donated by James Hagerman, Jr., who is chairman of the committee of arrangements. Roy F. Britton and Alden H. Little are the other committeemen.

### BRIDGEPORT HILL CLIMB POSTPONED TO MAY 30.

BRIDGEPORT, CONN., Aug. 31.—The Automobile Club of Bridgeport has decided to postpone its proposed hill climb scheduled for Labor Day to Decoration Day, May 30, 1908. The reason given for the postponement is that so many of the club members are out of town on their vacations that it will be impossible to handle the matter as satisfactorily as is desired. The last hill climb at Sport Hill on May 30 was a great success, and all energies will be bent in making it a splendid annual event of national import each Decoration Day morning.

### ADDITIONAL PRIVILEGES FOR A. C. A. MEMBERS.

NEW YORK, Sept. 2.—The Pequot Casino Association, of New London, Conn., has extended to the members of the Automobile Club of America the privileges of its clubhouse and grounds for the present season. The casino is situated on the west shore of New London harbor, easily accessible by automobile over good roads, is open all the year, with the exception of strictly winter months; has a number of sleeping rooms, a restaurant, and other conveniences. A. C. A. members can avail themselves of the privileges upon the presentation of their club card.

The Long Island Railroad Company has requested that the attention of A. C. A. members be called to the many gates at crossings which have been run into and broken by automobiles, and to the fact that these gates, when down, are always protected at night by a white light hanging thereon.

Owing to the expense of furnishing the jointed staff, A. C. A. members are notified that the price of the small club flag has been increased from \$1.50 to \$2.

Members are warned of additional speed traps at the following places:

New Jersey—Pleasantville, at the western end of the Atlantic City boulevard.

Pennsylvania—On the Trenton to Philadelphia road, on Pennsylvania side, ten miles south of Trenton, in Middletown township, Matamoras; over the Pennsylvania line, near Port Jervis.

New York—Nyack, on main street, in center of town.

Long Island—Amityville, in village limits; Cold Spring Harbor, in village limits.

### INDIANAPOLIS CLUBS WILL NOT MERGE.

INDIANAPOLIS, Sept. 1.—The effort made a short time ago to effect a consolidation of the Automobile Club of Indiana with the Indianapolis Motor Club has fallen through, and the proposition to purchase jointly the property at Broad Ripple is off as far as the automobile club is concerned. A joint committee representing the two clubs visited the place recently and while the motor club committee was in favor of purchasing the property, the auto club representatives failed to see the advantages of a club so near the city for drives, yet too far away for a convenient stopping place. The automobile club at present has very desirable rooms in the Denison Hotel, where lunches are served daily. This location will probably be retained until a building is either built or purchased that will satisfy the demands of the organization.

The annual hill climb of the Automobile Club of Indiana will be held some time during the present month, but the date is not yet fixed. There is some talk also of promoting a 24-hour race.

### OHIO'S STATE ORGANIZATION IS ACTIVE.

CLEVELAND, Sept. 1.—That energetic body of automobilists, the Ohio State Automobile Association, which has its headquarters in Cleveland, is making strenuous efforts to increase its membership, with the object of becoming an important factor this winter in securing increased appropriations for good roads and more equitable laws for automobilists from the State legislature. Secretary Hower has been personally working in different cities and towns, with the result that a number of clubs are in process of formation. Many unattached owners are also joining.

### JERSEYMEN PLAN ANOTHER ENDURANCE RUN.

NEWARK, N. J., Sept. 1.—A somewhat similar contest to the three-day endurance run of last spring is contemplated by the New Jersey Automobile and Motor Club for election day, No-

September 5. Although the matter has not come officially before the club, Secretary H. A. Bonnell is sounding the members on the matter. His idea is an eighteen-hour endurance run, not over the best roads of the State, as was the recent three-day contest, but on poor roads, which would serve to test the cars better. The cars can be started the evening previous to the day of the contest and would be compelled to run all night without stop, finally checking in at noon on election day. If the plan finds favor among the local dealers, it will be brought up for consideration at the next directors' meeting, September 9.

Seventy-two new members have been added to the roster of the club since May, 54 of whom are active members and 18 of whom are associate.

#### ONE OF MISSOURI'S ENERGETIC CLUBMEN.

SPRINGFIELD, Mo., Aug. 31.—Southwestern Missouri is making splendid progress in advancing automobile interests, largely through the vigor of the officials of the various clubs in this section of the State. The Automobile Club of Springfield has a president in William H. Horine whose energy is proverbial, and largely through his efforts the club has taken the position of

#### PRESIDENT HORINE AT THE WHEEL OF HIS THOMAS FLYER.

one of the most progressive organizations west of the Mississippi. Now that Missouri has a fairly equitable automobile law on its statute books, every effort will be put forth by autoists in this section for road improvement at the next legislative session.

#### MILWAUKEE WILL HAVE ORPHANS' DAY, SEPT. 5.

MILWAUKEE, Wis., Sept. 1.—Next Saturday, September 5, the orphans of the Protestant Orphan Asylum, the Catholic Boys' Home and those from St. Vincent and St. Rose's Asylums will be given their annual outing by the Milwaukee Automobile Club and the Automobile Trade Association. A ride about town will be taken and dinner will be served at Washington Park.

#### NORRISTOWNERS WILL HAVE NEW CLUBHOUSE.

NORRISTOWN, Pa., Sept. 2.—The Norristown Automobile Club has decided to build a \$7,500 clubhouse on a plot of ground recently purchased on DeKalb street, in Norristown township, just outside the borough limits. Plans are being prepared for a brick building one and a half stories in height, with a 40-foot front and large veranda. The lot is 200 by 250 feet.

#### IOWANS HAVE A MUSK MELON FEAST.

DES MOINES, Ia., Aug. 31.—The annual midsummer picnic of the Iowa Automobile Club was held last Sunday at the Prouty farm, a charming spot eight miles from this city. The club members and their friends were the guests of Cheney Prouty, who furnished musk melons galore, fresh from the vines.

## THE AUTOMOBILE CALENDAR. AMERICAN.

### Shows and Meetings.

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.
- Nov. 2-9.....—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.
- Nov. 29-Dec. 6.—Chicago, Casino Garden, Second Annual Auto Parts Show. A. M. Andrews, secretary, 184 La Salle street.
- Nov. 30-Dec. 7.—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 14-21.....—St. Louis, Mo., New Coliseum, Second Annual Auto Show, St. Louis Automobile Manufacturers' and Dealers' Association.
- Dec. 28-Jan. 4.—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.
- April 6-11.....—Buffalo, Convention Hall, Motor Boat and Sportsman's Show. D. H. Lewis, manager.

### Races, Hill-Climbs, etc.

- Sept. 6-7.....—New York City, Morris Park Track, 24-hour Race Meet. Morris Park Motordrome Club, office, Times Building.
- Sept. 7.....—Hartford, Conn., Hill Climb, under the auspices of the Automobile Club of Hartford.
- Sept. 7.....—Minneapolis, Minn., State Fair Race Meet of the Minnesota State Automobile Association.
- Sept. 9-10.....—Pittsburg, Pa., Brunot's Island Track, Race Meet, Automobile Club of Pittsburg.
- Sept. 10-12.....—Cleveland, Three-day Utility Run for Pleasure and Commercial Automobiles of Classes, Cleveland Automobile Club.
- Sept. 14.....—Philadelphia, Point Breeze Track, Quaker City Motor Club.
- Sept. 14.....—Jamestown (Va.) Exposition, Aeroplane Contest for "Scientific American" prize.
- Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.
- Sept. 20-21.....—Milwaukee, Wis., State Fair Grounds Track, 24-hour Race, Milwaukee Automobile Club and Milwaukee Dealers' Association.
- Sept. 21.....—Harrisburg, Pa., Middletown Track, Race Meet, Motor Club of Harrisburg.
- Sept. 22-24.....—Newark, N. J., Olympic Park Track, Essex County Fair Automobile Races.
- Sept. 30-Oct. 5.—Trenton, N. J., Inter-State Fair Automobile Races, includes 24-hour Event.
- Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

### FOREIGN.

#### Shows.

- Aug. 1-Sept. 30.—Holland, Amsterdam, International Exhibition of Motors and Machines, Palace of Industry.
- Sept. 28-Oct. 7.—Denmark, Copenhagen International Auto Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1.—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.
- Dec. 5-22.....—Berlin, Germany, Automobile Show.
- Jan. 18-Feb. 2.—Turin, Italy, Fifth International Automobile Exposition, Palace of Fine Arts, Valentino Park, Automobile Club of Turin.

#### Races, Hill-Climbs, etc.

- Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.
- Sept. 15.....—France, Chatcau-Thierry Hill Climb.
- Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.
- Oct. 20.....—France, Gaillon Hill Climb.
- Nov. 1-15.....—France, Volturette Contest near Paris.
- May 16, 1908....—Sicily, Targa Florio, Automobile Club of Italy.
- June 20-July 5, 1908.—Grand Prix, Dieppe Circuit, Automobile Club of France. (Exact date to be announced.)
- July 14, 1908....—Paris to London, Aerial Race.

## CLEVELAND CONTEST'S INTERESTING RULES

A SEALED bonnet and reliability contest, an electric automobile efficiency contest, and a commercial motor vehicle utility contest are planned by the Cleveland Automobile Club for September 10, 11 and 12. The three competitions will start from the club rooms at the Hollender Hotel, Cleveland, at 8 A.M., Tuesday, September 10, and continue on the two following days. Detailed schedule of the run will be given to each entrant at the start of the test. The Contest Committee in charge of the three events consists of Geo. H. Bowler, Walter C. Baker, H. M. Adams, Chas. Mears, Fred J. Baird. Official regulations for the sealed bonnet and reliability contest are as follows:

**CLASSIFICATION.**—Entrants will be run in one class and must carry at least three passengers, unless seating capacity of the car is for a less number.

**ENTRIES** shall be made on special blanks furnished by the Cleveland Automobile Club. Each entry blank shall be accompanied by an entry fee of \$10.00, currency or check; if check, made payable to the Cleveland Automobile Club. The time for receiving entries expires on Saturday, September 7, at 12 P.M. Cars entering after September 7 (midnight) until Monday, September 9 (midnight), must pay an entry fee of \$20.00. A separate entry blank is needed for each car. Entry blanks with entrance fees must be mailed or delivered to Geo. H. Bowler, care of the Cleveland Automobile Club, Cleveland. The contest committee reserves the right to refuse any entry. No entry fee refunded unless entry is rejected. Cars will be started at intervals of two minutes, the order of start being according to the contestant's entry number.

**ENTRANTS' CLASSIFICATIONS.**—The entrants may or may not drive and a change of drivers will be permitted any place on the course, all drivers being passengers in car continually from start to finish. Cars entered must from start to finish be of standard models, equipped according to catalogue specifications. No advertising sign or other indications of the maker's name, further than the name plate or such lettering as may be painted on each car, shall be displayed from the car any time during the test. Decision on this point to be by starter.

**PENALIZATION.**—The winner will be that car having the least penalization according to the following schedule: Each stop of motor, except where permitted by instructions on route card, 25 points. Breaking bonnet seal, 50 points each time. For each minute or fraction thereof spent in repair, adjustment, or replacement on car from start to finish, 5 points. Contestants will be allowed without penalization to fill oil tanks and gasoline tanks and to turn on or off the lubricator, but make no lubricator adjustments. Five points per minute or fraction thereof for taking on water.

**SEALING OF CARS.**—Cars must present themselves at the Cleveland Automobile Club one hour before their scheduled time to start so that seals may be affixed to the bonnet and coil box. Cars with ollers under the bonnet may make provision to fill the ollers without taking off the bonnet. Cars must regularly carry mud aprons and tampering with motors from beneath the frame or through the mud apron or bonnet will mean a penalization equal to that of breaking the bonnet seal. Cars with motors not beneath a forward bonnet must provide themselves with mud aprons of metal or cloth entirely enclosing the underside of the motor so that suitable seals can be attached.

**SCHEDULE.**—The contest committee will furnish each car a schedule not sooner than thirty minutes before starting each morning. The schedule will fix the exact minute at which each car in each class may pass a checking station without penalization, the schedule for which will not exceed operating the cars at faster than the legal speed. Cars will not be permitted to make up time and penalty will be based upon run between each two checking stations.

**RUNNING REGULATIONS.**—Each car must carry prominently displayed from sides its official number throughout the test. Entrants must conform to the laws and ordinances of the road. Arrest during tour for violation of speed laws or traffic regulations may, at the discretion of the referee, result in disqualification.

**CHECKING STATIONS.**—The number and location of checking stations will not be known to contestants until the schedule is received before starting each morning. At each checking station every car must stop, the observer handing his running card to the

checker, who will mark the time upon it and return it to the observer, after which the car must immediately resume its journey. Entrants will not be permitted to enter any checking stations before the time for their arrival upon the running card, and are given ten minutes leeway after the time marked upon running card, penalization occurring only after expiration of said ten minutes leeway.

**OBSERVERS.**—Each entrant must furnish one man to act as observer, and said observer will be transferred to a different car each day. Observers must remain through the entire day's run with the car to which they are assigned. They will receive a running card and must see to it that the starting time is marked upon it at the start and that the time is marked upon it also at each checking station and also at the finish. Observers must record each incident during the tour that receives penalization, marking the penalization points. At end of run he must sign his card and hand it to a clerk at finishing point.

**AWARDS.**—No award will be offered further than a certificate showing the record made by the car during the contest.

**PROTESTS.**—All protests as to entries must be made to the referee before the start. All other protests should be made during the run or before noon next day. All protests must be made in writing to the referee and each accompanied by five dollars, which will be returned in case the protest is sustained. Accompanying a protest must be a written statement of the conditions causing the protest, and protestees must procure witnesses or others possessing knowledge relative to the protest before noon next day before the referee.

**ACCIDENT LIABILITY.**—Every entrant must become acquainted with these rules and on entering agrees to abide by them; agrees to accept the official records of the contest committee, and authorizes the committee to publish them in any manner that it decides upon. Entrants shall hold the Cleveland Automobile Club harmless and indemnify them against all losses or damage resulting directly or indirectly or growing out of the operation, management or control of the car entered by them from the time of entrance until the completion of the contest. The Cleveland Automobile Club shall not be responsible for any damage that may be done to any car, passenger or contents, during the contest, or for the theft of any car, accessory or content; the car at all times subsequent to the start and until the end of the contest being at the entrant's risk.

**REGULATIONS.**—All entrants may advertise the performance of their cars in any manner they see fit, but in case any entrant advertises contrary to the findings of the contest committee, they will be barred from future contests conducted by the Cleveland Automobile Club until such time as decided upon by said organization.

The contest committee reserves the right to alter, amend, repeal or add to these rules up to the start of the tour as it may, in its judgment, deem expedient.

For the electric automobile efficiency contest the following special regulations apply, all other matters not herein mentioned being as in the sealed bonnet test:

**CLASSIFICATION.**—Entrants will be all run in one class.

**CONDITIONS OF RUN.**—All cars must carry at least two passengers, one to be an observer selected by the committee. Each car must make a run of at least 40 miles on one charge. The batteries must be fully charged at the end of each run, and an accurate record will be kept of the watt-hours necessary for such charge. The running weight (i. e., with passengers), will be used to determine the watt-hours per ton mile at the average speed made during the run, determined from time taken at start and finish. These results will be reduced to a speed of 12 miles per hour, on the basis of the watt-hours being proportional to the square of the speed. Neglecting the weight and under the same proportion the watt-hours per passenger mile will be determined. These results will be used to determine the efficiency. Cars must average at least 10 miles per hour, and must not exceed 15 miles per hour. An average of less or more than above specified will disqualify a car. There will be no restrictions to the number or size of cells. There must be specified on each entry blank for each car the make of battery which the car will use in the contest, capacity of same and cells in same.

**CHECKING STATIONS.**—The number and location of checking stations will not be known to contestants until the schedule is received before starting each morning. At each checking station

every car must stop, the observer handing his running card to the checker, who will mark the time upon it and return it to the observer, after which the car must immediately resume its journey. Entrants will not be permitted to enter any checking stations before the time for their arrival upon the running card, and are given ten minutes leeway after the time marked upon running card, penalization occurring only after expiration of said ten minutes leeway.

The features in which the regulations of the commercial motor vehicle contest differs from the two others are:

**CLASSIFICATION.**—Entrants will be divided into two classes, as follows: Class 1—Cars listed to carry loads up to and including one ton. Class 2—Cars carrying more than one ton. This classification will be arranged to practically divide commercial vehicles into delivery wagon and truck classes, and will be subject to such changes as the character of the entries may suggest.

**PENALIZATION.**—The winner in each class will be that car having the least penalization, according to the following schedule:

Five points for each minute or fraction thereof during which the car is stopped for any adjustments whatsoever. Ten points for each minute or fraction thereof late in reaching a checking station or control. Five points for each caution received from those in authority for infringement against the traffic regulations of the streets of the city of Cleveland. Any car exceeding the city speed limits will be disqualified at once. For each repair part or replacement to the car, a penalty of 5 points for each dollar in value for same will be deducted. This to apply whether done upon the road or during the night storage of the car.

**RUNNING REGULATIONS** same as in the two previous contests, with the addition that all cars must throughout the run carry such load as the contest committee may authorize, and such load will not be more than the catalogue capacity of the car.

Large users of commercial vehicles, including some of the express companies and the United States Postoffice Department, have signified their intentions of having representatives present to watch the contest.

## WHAT DOES IT COST TO OWN AN AUTOMOBILE?

SO much has been said and written regarding the extravagant outlay required to maintain an automobile that doubtless many have been deterred from investing solely on that account, and it is a matter of common knowledge that the prospective purchaser's chief concern is, What is it going to cost to keep the machine? In view of this state of affairs, the following summary of the experiences of a great many owners in all parts of the country will be found of considerable interest:

How long will an automobile last?

What does it cost to operate it?

How many miles will it run on a gallon of gasoline?

How long will the tires wear?

are probably the four important factors in the life of an automobile. In some cases an automobile in the hands of a competent driver will give a great deal more satisfaction, at a minimum cost, as compared to the same car in the hands of a less experienced man.

To determine the average cost of maintaining and operating an automobile, an enterprising manufacturer has just compiled statistics showing that with judicious handling and the ordinary care that should be accorded an automobile the amount to support a machine is not nearly as great as most people believe. The Cadillac Company determined recently to discover the cost. It sent invitations through the newspapers throughout the country and to owners of single-cylinder Cadillacs, asking them for sworn statements as to the total expense incurred in the maintenance of their cars. Of those who responded hundreds were willing to make statements of the approximate cost of running their cars, yet none of these was used. Only the actual cost, sworn before a notary public and witnesses, were accepted. One hundred and sixty-four statements were received, coming from thirty different States, which show records of cars that have been used on all kinds of roads and under all sorts of conditions. From the data received the following statistics were compiled: The mileage gotten out of the cars varied considerably, ranging from 850 to 32,000. Many of the affidavits showed a mileage of over 20,000 and nearly 50 per cent. had gotten over 10,000 miles out of their cars. The total combined made over 1,500,000 miles, or, to be exact, 1,555,427, the average of this being 9,661 miles per car.

The gasoline consumption afforded great interest. One car running as low as 9 2-3 miles per gallon, while another ran as high as 32 miles per gallon. Forty per cent. of the number have claimed to get over 20 miles per gallon, while the average of all is a trifle over 18 1-3 miles per gallon. The cost of repairs: This amount ranges from practically nothing in some cases to several hundreds of dollars in others. The total amount of repairs, not including tires for the 161 cars, was \$6,881.29, or an average for each car of \$42.74. For the average length of time the cars have

been used (1 year, 7 months, 20 days), it means an average of \$2.17 per month, or less than 51 cents per week. Another way to compute the cost would be to total the distance traveled, taking 161 cars totalling 1,555,427 miles and with the total cost for repairs \$6,881.29, it means that the cost of the upkeep averages .004939 per mile, or, in other words, only 44 1-4 cents per 100 miles that is traveled. That certainly is cheaper than walking. In considering these points do not overlook the number of passengers carried. Some were runabouts carrying one or two and sometimes three passengers, while others were four-passenger cars carrying five or six passengers. The average as shown by affidavits was nearly 3 1-2 persons, so it would make this expense less than 13 cents per 100 miles for each passenger.

The next item of expense is that of gasoline. The sworn statements show that the miles obtained per gallon run from as few as 9 2-3 up as high as several who got 23 or more, and one as high as 32 miles per gallon. Take the average of the lot, it shows 18.34, or a trifle over 18 1-3 miles per gallon. The cost of gasoline varies in different parts of the country, but may probably be averaged at 18 cents a gallon. It would then make the average one cent per mile per car for fuel, or less than 1-3 of a cent per mile per passenger.

To obtain the amount of expenditures for tires, which in some cases had been included in the repair expenses because many owners do not keep separate expense accounts, 200 dealers throughout the country were asked the following questions:

What is the longest time you have known a set of tires to wear?

What is the greatest number of miles you have known a set of tires to run?

If a customer were to ask you as to about how long or how many miles a set of tires could be expected to last, with proper care, what would you tell him?

The answers to the first question were, in about two years, in some cases less, and in several cases three years, and one answer was four years. To the second question the answers were, all the way from 4,000 to 15,000 miles, but the majority run along from 6,000 to 9,000 miles. Regarding the third question, there was a wide difference of opinion, but they averaged up between one and two years and from 5,000 to 10,000 miles, many replies being qualified by the statement that it would all depend upon the carefulness of the operator and the roads he would have to travel. It certainly is commendatory not only to any one car, but to the whole industry, when, after a careful canvass of over 160 automobile owners, it is authentically estimated that the cost of upkeep of a carefully operated car renders the cost of transportation, per mile, less than any other means of locomotion. The data obtained should dispel popular illusion on this subject.

HEAD-ON VIEW OF THE NEW LOZIER FOR 1908.

“AT certain periods, cumulative experience teaches wherein design and constructive practice may be improved upon, and the year 1908 brings forth, therefore, a Lozier car which is entirely new and different in every detail from its predecessor, the only feature of the car bearing any resemblance to the former models being the cooler. The new car embodies modern and up-to-date features of such a nature that the buyer of one of these cars will probably find little occasion to make any change for several years to come.”

So runs the publicity man's foreword announcing the new Lozier for 1908, and a review of the specifications of the car, bearing in mind those of its predecessor, show that the statement that nothing but the radiator is the same is a brief, but true, summing up of the changes made. In no case, however, have the latter been extended into the field of pure experiment or uncertainty, every feature adopted having already undergone the test of time to an extent that entitles it to rank high in the category of the most approved standard practice. The most revolutionary change, from the point of view of the casual observer, consists of the adoption of the shaft drive, though chain-driven cars will still be found in the Lozier line.

The new car will be officially known as Type H, and to begin with the motor, which fairly bristles with new features, this consists of two two-cylinder units, or twin castings, as previously, and finished in pearl-gray baked enamel. To provide for access to as much of the interior of the motor as possible, without the necessity of dismantling the latter, the cylinder castings have been made with large openings in the heads. These are covered with removable plates to facilitate the inspection of the water jackets, and the lifting of these plates also reveals the presence of two liberal-sized bronze screw plates, the removal of which permits access to the firing chamber of each cylinder. The bore and stroke measure  $5\frac{1}{4}$  inches, the

“square” dimensions being best adapted to the high-speed motor. The motor is nominally rated at 45-horsepower, in accordance with the formula recently adopted by the Association of Licensed Automobile Manufacturers, although it will develop 60 actual brake horsepower as compared with the present 40-horsepower rating.

The crankshaft is of unusually liberal dimensions and the same may be said of the annular ball-bearings upon which it is supported, special oil-retaining rings being fitted to each set of bearings.

Lozier practice is adhered to in the valve placing and operation, but the nickel-alloy valves themselves have been enlarged. The one-piece camshafts are also mounted on annular ball-bearings, five to each shaft, and the latter are housed in the engine base so that they be readily withdrawn through the forward end. The valve-lifter housings are held to the sub-base by a yoke, each yoke holding two housings, while each lifter carries springs independent of the valve springs, and the latter, together with the remainder of the valve-operating mechanism, is enclosed by aluminum covers, further reducing the small amount of noise produced as well as protecting them from dirt and giving the outside of the motor an appearance of extreme simplicity and compactness.

The lubricating system is a combination of splash and force feed, and reservoir and oiler being located between the side of the motor and the frame. The oiler is of comparatively small capacity, but is automatically kept replenished from a three-gallon tank on the frame. It is driven by spiral gears direct from the camshaft, while the magneto and pump, located on opposite sides of the motor, are driven by spur gears, the fan being operated by a combination bevel gear and clutch, all these gears being housed and running in oil. The magneto and pump driving shafts are fitted with universal joints, and in the case of the former this takes the form of a notched internal and external gear, providing a simple method

PLAN VIEW OF SHAFT-DRIVEN CHASSIS.

INLET SIDE OF THE 1908 LOZIER MOTOR, SHOWING IGNITION WIRING.

of timing the magneto by remeshing the gears as required; both the shafts in question are ball-bearing.

The ignition system is in duplicate throughout, each side consisting of an entirely independent unit, which may be used separately or in conjunction with the other as desired. The system relied upon for the bulk of the work consists of a Bosch high-tension, ball-bearing magneto connected to a set of plugs screwed into the inlet valve covers, while the standby and starting system consists of a set of 60 ampere hour accumulators supplying current to a single vibrator coil and ball-bearing distributor from which it is led to a set of plugs over the exhaust valves. The distributor is mounted on an aluminum standard located between the two pairs of cylinders and is permanently fixed, thus holding the wiring stationary, the necessary movement for advancing or retarding the spark being obtained by moving the shaft, the timing lever on the steering wheel sector operating on the distributor and magneto simultaneously. The carbureter is of the usual automatic type, controlled by a hydraulic governor operated by the water pump, the pressure at varying speeds acting upon a diaphragm linked to the piston throttle.

The clutch is of the multiple disc type employed on former models, but has been increased in size until it now occupies the entire flywheel diameter, so that the gear-set is placed very close to the motor. The clutch consists of 33 alternate steel and bronze discs, the clutch-pedal being interconnected with the gear-shifting lever; both the clutch-pedal shaft and brake-lever rocker arm are mounted on annular ball-bearings, while the clutch thrust is taken up by a ball-bearing plate. The gear-set provides four speeds forward and reverse, the direct drive being on the third when there are no gears working. Speeds of 12 to 50 miles an hour are attainable on the direct drive, the fourth giving an increase to 60 miles an hour. All the shifting forks are inclosed within

REAR SUSPENSION, CRANKSHAFT, FAN DRIVE AND CAMSHAFT.

the gear case, thus obviating the leakage usual at their points of entrance. Clashing of gears in shifting is prevented by a disc brake on the clutch shaft, while the change-speed lever is also interlocked with the clutch.

All gears and shafts are of specially treated chrome nickel steel mounted on annular ball-bearings, and this material has also been lavishly employed on other parts of the car. This is true of the propeller shaft, which is placed at a very slight angle to the horizontal so that the work of the universal joint is very light. The shaft itself is housed in a nickel-steel tubular casing and the universal at the forward end is also enclosed in dust-proof housing. A floating type of rear axle is employed, the driving shafts being of nickel steel with ample sized differentials of the bevel type, while all pinions are of chrome nickel steel specially hardened and treated. The nickel steel housings of the axle driving shafts are riveted into the cast-steel housing of the bevel drive.

The changes extend to the details of the chassis construction as well, the rear platform spring now being clipped in the center to a large bracket and parallels the cross member of the frame to the rear instead of being placed beneath it as formerly, a change that permits of a longer wheelbase with less overhang than before. Other features of note are the attachment of the 27-gallon gasoline tank to the underside of the frame and the use of a protecting pan of cast aluminum. The steering column has been given slightly more inclination and the dash cleared of everything superfluous, there being but a single vibrator coil,

DRIVING UNIT WITH UPPER HALF OF DIFFERENTIAL CASE REMOVED

switch, pressure gauge and two oil-bleeders in sight. The wheels are 36 inches in diameter and shod with 4-inch tires front and 4 1-2-inch rear. The wheelbase is 124 inches and the weight with a 7-passenger touring body, 3,400 pounds. The general style of the body, which is of the familiar straight-line type, has undergone practically no change.

### ECONOMICAL PERFORMANCE OF A TRUCK.

Twenty-five hundred miles under load in three months, with a total of but 11 1-2 hours for stops, is a record that any commercial car might well be proud of, particularly under the adverse road conditions to be found in and around western cities. This is the performance of the Phoenix, three-ton truck built by the Kansas City Motor Car Company. The stoppage mentioned was for the execution of repairs of a most trivial nature, as may be realized from the fact that they consisted of replacing a home-made high-tension magneto with a Bosch machine of the same type, and changing the radiator, which had sprung a leak, the remainder of the 11 1-2 hours being consumed in making brake and carbureter adjustments. As a result of the experience with the radiator, a new form of three-point suspension has been adopted, effectively overcoming any further possibility of recurrence of this trouble.

During the period in question, the average cost of hauling a ton per mile has figured out at \$.09 3-4, this including an outlay of \$250 annually for tire maintenance, \$18 per week for the driver, all gasoline and oil consumed, and ten per cent. on the cost of the vehicle for depreciation, which is a remarkable showing in view of the grades prevailing in and about Kansas City.

### STODDARD-DAYTON AGENTS MEET TO DISCUSS.

DAYTON, O., Aug. 31.—A three-day convention which it is expected will develop into an annual affair, has been held at the Dayton Motor Car Company's headquarters. The program, arranged to combine business with pleasure, opened with a visit to the factory, followed by luncheon, an inspection of 1908 models, and an automobile ride. After the entire second day had been spent in discussing business methods, the full body of agents united in a dinner at the Algonquin Hotel, followed by a smoker. The third day was given up to the further inspection of new models and to personal interviews. During the conference Ed. Leinbach, of Baltimore, was presented with a handsome loving cup by the agents as a recognition of the successful manner in which he drove the Stoddard-Dayton runabout in the recent A. A. A. tour.

Those in attendance at the convention were: Messrs. Whitney and Ferris, Boston; J. A. Cramer, Buffalo; J. H. Ratliff, Cincinnati; H. L. Babcock, H. C. Tillotson and Discher, Chicago; O. G. Roberts, Columbus, O.; H. S. Moore, Cleveland; Sears, Des Moines; B. G. Burrington, Holyoke, Mass.; Fisher & Moore, Indianapolis; C. Ettwein, Kansas City, Mo.; H. S. Haynes, Minneapolis; Guy Hartwell, Mobile; Richard Newton and A. H. Whiting, Des Moines; H. B. Tuttle, New Haven; J. W. Mason, Newark, N. J.; J. P. Parker, Memphis; H. M. Smith, Toronto, Canada; E. Estell, Omaha; Hamilton, Philadelphia; G. B. Moore, Pittsburgh; E. L. Nock, Providence; A. M. Zinbrich, Rochester; Geo. Haff, San Antonio; O. V. Reopell, Springfield, Mass.; J. Lucey, Jr., Troy; Geo. Schollenberger, Wichita, Kansas; Schnure, St. Louis; Garvey, New Orleans.

### EXTENSIVE ADDITIONS TO RAMBLER PLANT.

KENOSHA, WIS., Sept. 1.—Liberal increases in the facilities of their already large plant have been found necessary by Thomas B. Jeffery & Company, makers of the Rambler automobiles, and the additions are now under way. They consist both of extensions to old buildings and the construction of new ones. These buildings are entirely of concrete with steel and glass roofs of saw-tooth construction, thus assuring light and sanitary conditions as well as protection against fire. The extensions now in course of construction aggregate 50,000 square feet of floor space, which brings the total in the plant to approximately 16 acres. A recent addition to the plant's facilities is the completion of an artesian well, 1,500 feet deep, which has required a year to sink. The natural pressure is sufficient to carry the water to all the buildings, but a pumping plant has been installed for fire protection. As the lighting and heating plants are a part of the factory equipment, this makes the plant entirely independent of outside service.

### HEAVY DEMAND FOR SPACE AT GARDEN SHOW.

At a meeting of the show committee of the Association of Licensed Automobile Manufacturers held on Friday last, it developed that there has been an increase of 25 per cent. in the number of applications for space at the eighth annual show to be held in the Garden, November 2-9. There were over 250 exhibitors last year, while up to date 300 applications have been received, for which allotments have already been made. A feature of the show will be the motor-cycle section in which 31 manufacturers have secured space. The rules regarding the display of advertising matter will be the same as in previous years and the uniform decorative scheme will include the motor-cycle section. Colonel George Pope, Charles Clifton, Marcus I. Brock and M. L. Downs, secretary, were present at the meeting.

Export returns for the month of July, 1907, show an increase to \$796,325 from \$513,179 for the corresponding month last year, this total covering the value of 345 complete cars and \$68,934 worth of parts. For the seven months ending July, 1907, the total is \$4,245,490, representing the value of 2,052 cars.

MORRIS PARK TRACK'S EXCELLENT CONDITION IS SELF-EVIDENT.

### ARRANGEMENTS FOR MORRIS PARK RACES.

Eighteen thousand gallons of oil have been used in putting the Morris Park track in shape for the 24-hour and other races scheduled for September 9-10, and the course will be brilliantly illuminated at night. The Morris Park Motordrome Club has guaranteed the payment of the \$1,000 purse for the 24-hour race by offering to deposit a certified check for the amount with the A. A. A., and a number of entries from prominent makers is expected. One of the entries made Tuesday in the short-distance events was E. Russell Thomas's 120-horsepower Hotchkiss, driven in last year's Vanderbilt Cup race by E. Fitz Shepard. It will be driven by Wally Owen in the record trials.

### DRAGON AUTOMOBILE COMPANY REORGANIZES

PHILADELPHIA, Sept. 3.—While there has been no radical change in the interests involved in the Dragon Automobile Company, the latter has recently been reorganized with John Kane Mills again at its head. It will be recalled that he retired several months ago on account of ill-health. The new list of officers is as follows: President, John Kane Mills; vice-president and treasurer, Henry Rawle; second vice-president and sales manager, A. L. Kull; general manager, J. H. O'Brien. The directors are J. F. Grimes, Pittsburg; Francis Rawle, Philadelphia; John Kane Mills, New York; Henry Rawle, Philadelphia; A. L. Kull, New York.

### NOVEL LIGHT-WEIGHT BODIES OF RATTAN.

Suitable materials for the building of automobile bodies are not as numerous as might appear at first sight, so that the choice of rattan for this purpose carries with it many advantages. Chief among these naturally is lightness, it being claimed by the makers of the novel body shown in the accompanying illustration, the Amesbury Reed & Rattan Company, Amesbury, Mass., that it weighs one-third less than a similar construction of wood. The rattan is rubber lined, making it dust and water-proof, while the leather upholstery is all kept in place by patent fasteners, thus rendering it easily removable for washing. These bodies are made in runabout styles also, and are designed to fit any type or make of chassis.

NEW WATERPROOF AND DUSTPROOF RATTAN AUTO BODY

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Shoemaker Automobile Co., of Freeport, Ill., is considering a flattering offer from Elkhart, Ind., to locate its manufacturing plant in that city.

The collection department of the New York Automobile Trade Association which was recently established, is proving a very successful feature. The association now has a membership of 61 local dealers and garage owners, making it the largest association of its kind in existence.

According to the Electric Vehicle Co., of Hartford, Conn., the season of 1908 will be a good one for electrics. The present season has marked an increased use of this type of vehicle, and many light electric victoria phaetons have been sold, most of them to women.

Three more concerns have been admitted to membership in the American Motor Car Manufacturers' Association, bringing the total up to 49. The new members are the Reliance Motor Truck Company, Detroit; Gaeth Automobile Works, Cleveland, and the Imperial Motor Car Company, Williamsport, Pa.

In the recent Coupe de la Presse race in France the Continental Caoutchouc Tire Company had the honor of fitting the winning car with Continental tires that covered the entire distance of 400 kilometers without changing. The tires were reported to be in excellent condition at the finish.

The new Rainier factory at Saginaw, Mich., is now in full operation, turning out the 1908 product under the supervision of James G. Heaslet, who has designed the Rainier cars for the past three years. Ezra E. Kirk, general western sales manager for the company, left Saginaw, September 2, for the Pacific coast on an extended trip for the purpose of placing agencies.

One exhibitor that will be distinctly missed from all the New York shows this year is the American Locomotive Automobile Company. This company maintains a neutral attitude and is not a member of either of the rival manufacturers' associations. For this reason it could not obtain preferred space, and therefore it decided last week not to be a part of any show, but to hold a two-week show of Berliet cars independently in the reception of the Waldorf-Astoria near the Thirty-third street entrance, from October 24 to November 9.

### NEW AGENCIES ESTABLISHED.

The Maxwell-Briscoe Motor Company has established new branch houses at Dallas, Tex.; Pittsburgh, Pa.; Atlanta, Ga., and Kansas City, Mo. The company expect to have 15 branch houses throughout the country by the time its 1908 selling force is thoroughly organized.

President P. C. Avery, of the Avery Portable Lighting Company, of Milwaukee, Wis., while in New York last week opened a metropolitan distributing house at 51 West Sixty-third street, adjacent to Broadway. A full stock of recharged tanks of all makes will be carried. The new branch will supply agents in the Eastern States and will be in charge of A. W. Kaestner, who has been connected with the factory at Albany, N. Y., for some time.

The J. W. Bowman Company has been appointed Boston selling agent for the

Stevens-Duryea for 1908, succeeding the estate of the late F. E. Randall, who handled the agency successfully in Boston for a number of years. Permanent warerooms will be opened in a few days at 911 Boylston street, and a repair department has been established at 57-61 Stanhope street. Mr. Bowman, the head of the new concern, was formerly New York manager for the Fisk tire branch.

### RECENT TRADE CHANGES.

On September 1 the Butler Auto Supply Company succeeded the Angier Auto Supply Company, 222 Park Square Motor Mart, Boston. H. M. Butler, president of the company, having purchased the interest of O. M. Angier, the former treasurer. The new company will continue to carry complete lines of auto supplies for which it is the agent.

Owing to the demand for Continental and Firestone tires, for which they are the Philadelphia agents, James L. Gibney & Brother have found it necessary to remove the offices to the second floor of their establishment, devoting the entire first floor to selling purposes, which will give them one of the finest salesrooms on Broad street.

### PERSONAL TRADE MENTION.

A. A. Kelsey, of Washington, of the Good Roads Bureau, Department of Agriculture, is now on a month's tour through Pennsylvania and New York in his Franklin.

Tony Nichols, chief demonstrator of the Boyer Motor Car Company, San Francisco, Cal., recently made a trip through the East of several weeks' duration, and visited the plants of the H. H. Franklin Mfg. Co., of Syracuse, N. Y.

Percy Owen, president of the New York Automobile Trade Association and United States importer of the Bianchi car, will return this week from Maine, where he has been enjoying a well deserved vacation.

G. N. Bliss has been appointed manager of the Chicago branch of Thos. B. Jeffery & Co., to succeed Joseph Gunther. Mr. Bliss comes from the Rambler factory, at Kenosha, Wis., where he has been located for some time past.

Fred P. Brandt, formerly sales manager of the Autocar Company, has been made vice-president and general manager of the Imperial Motor Car Company, of Williamsport, Pa., the new automobile manufacturing enterprise in which State Senator Cochran, of that city, is interested.

Harold J. Ellsworth, formerly connected with the sales department of the Maxwell-Briscoe Motor Company, has been appointed general sales manager of the Colt Runabout Company, of Yonkers, N. Y., and C. B. Kraske has been appointed purchasing agent for the same concern.

R. G. Howell has resigned as manager of the Franklin department of Wyckoff, Church & Partridge, New York City, and will establish an exclusive agency in New York for an old-established manufacturing house. Mr. Howell expects to announce his plans about the middle of the month.

G. G. Luthy, secretary of the Bartholomew Company, Peoria, Ill., makers of Glide automobiles, has started for an extended

trip through the West. He will visit Denver, Salt Lake City, Butte, Spokane, Seattle, Tacoma, Portland, San Francisco, and Los Angeles, calling on established agencies and placing new ones.

E. A. Crosser, for the past two years with the Haynes Automobile Company, Minneapolis, Minn., has severed his connection with that house, returning to the employ of the White Company, with which he was formerly connected. He will look after the White interests in the Texas territory.

Robert J. Firestone, sales manager of the Firestone Tire & Rubber Company, will leave September 9 on a month's trip to Mexico and the Pacific Coast points. While in the City of Mexico he will establish a Firestone branch house there, and afterwards proceed on a tour of inspection of the Pacific Coast agencies. John D. Hodgkins, for several years manager of the St. Louis Firestone branch, will hereafter represent the company at Atlanta, Ga. O. O. Petty has been appointed to his former position as manager of the St. Louis office.

George W. Bennett, formerly identified with the Rambler interests and more recently general manager of the Knox Automobile Company, has accepted the appointment of manager of the metropolitan branch of the White Company, of Cleveland, with headquarters at Broadway and Sixty-second street, New York City, to take effect October 1, succeeding Carl H. Page, resigned. Mr. Bennett was for many years identified with Thomas B. Jeffery & Company, in fact since the period of extensive bicycle manufacture, and the Knox people were desirous of retaining his services for their reorganization. He, however, preferred to return to New York City, where he had made his early success. His predecessor, Mr. Page, who has successfully conducted the White branch for several years, has not yet announced his plans.

### AJAX-GRIEB CO. MEETING.

Final approval of the plans for the new factory buildings of the Ajax-Grieb Rubber Company was given by the stockholders at the annual meeting of the company in Trenton, N. J., on Tuesday of this week. The plans call for three buildings of brick, with a total floor space of 75,000 square feet on the west side of Olden street in Trenton, where about six acres of ground is owned by the corporation. The present factory is located on the east side of the street.

New officers for the ensuing year were elected, viz: President, Horace DeLisser; vice-president, Wm. G. Grieb; secretary and treasurer, Harry Grieb. Satisfactory dividends were declared on both the preferred and common stocks.

For the 1908 automobile tires the company has decided to devote its plant almost exclusively to those of the wrapped tread type in all sizes, and will be in fine shape to meet the increasing demands of its business when the new plant is completed. Thousands of this make of tires are used as regular equipment on Ford runabouts, Maxwells, Mitchells, and other well-known cars.

To-day (Thursday) President DeLisser will leave for a trip to the coast, his schedule calling for visits to agencies in seventeen different cities en route.

# THE AUTOMOBILE

AUTOTRACTOR LEAVING THE MILES OF PLOWED LAND BEHIND IT ON THE KANSAS PLAINS.

SINCE the earliest days of the automobile, those who have looked beyond its purely pleasure side have been prophesying its vast possibilities in a commercial way, and in none so much as an aid to the farmer. The traction engine and its capacity for hauling whole gangs of plows, harrows, or other agricultural machinery has made the vast farms of the western portion of this country possible. But the traction engine is a ponderous machine, due to its boiler, while its requirements in the way of fuel have made its use increasingly expensive, as both coal and wood are extremely scarce and high-priced commodities on the western plains.

#### What One Kansas Farmer Has Done.

It is a matter of common knowledge that experiments looking to the perfection of a commercially practical machine which can be marketed at a low figure have been under way in this country for some time past, but the investigators have been more or less chary of making public what they have learned up to the present. In the meantime a Kansas farmer has undertaken to solve the problem for himself, and, to judge from the reports of the working of his invention, appears to have succeeded in doing so to such an extent that a company is to be incorporated to place his machine on the market. He is Ansel S. Wysong, whose ranch is near Meade, Kan., and he calls his substitute for equine plow-pullers an *autotractor*. Considered as a whole, his machine does not differ a great deal from the ordinary traction engine, except that it is far lighter, much more powerful, and can get over the ground at a rate of speed that makes a tractor look like a selling plater.

He has mounted a 30-horsepower gasoline engine on a rigid frame carried on iron wheels with four-inch steel tires, so that

neither spring nor tire troubles will come his way, while the drive is also designed to be troubleless, as it consists of a heavy chain. The weight of the autotractor is but 4,100 pounds—a figure that is not much in excess of what many a heavily loaded limousine will tip the scales at. Two speeds are provided, one for plowing and similar heavy work, and the other, or high speed, for hauling a train of grain-laden wagons along the road at the rate of six miles an hour. Even on the low speed in the field, the machine travels much faster than horses and turns six furrows at a time.

This does not complete its round of usefulness, however, as by uncoupling the engine and running it as a stationary it is made to operate a pump, saw, thresher, or other farm machinery. Furthermore, it is never at a loss for fuel, as it will burn gasoline, kerosene, or alcohol with equal ease. This machine has been built by a practical farmer, familiar with the requirements of the service to be performed, and it would appear as if he had considered every phase of the subject in designing it. The inventor says he has plowed thirty acres of land a day on a fuel consumption of fifty gallons of gasoline, and the machine has proved so successful as a whole that it is intended to build duplicates of it in a factory to be established at Topeka, Kan.

#### A Californian Has Evolved a Farmobile.

One of the difficulties of adapting the automobile motor to farm work has been this very lack of weight, which is such a great advantage in other ways, and another investigator, R. D. Vercler, of Los Angeles, Cal., has solved the problem in rather a unique manner. Without a great deal of weight it was hardly possible to obtain sufficient traction even with ribbed wheels and often the driving wheels simply gouged a hole in the ground

HENRY FORD AT THE WHEEL OF A FARMOBILE.

without moving ahead. To overcome these difficulties a system of propulsion consisting of a stationary cable anchored at opposite ends of the field to be worked was devised, together with a machine to run on the cable, and the latter has been christened the *Farmobile*. The car is equipped with a pair of drums operated by a four-cylinder air-cooled gasoline engine, as will be plain upon the reference to the photographs.

The car stands directly over the cable, a few turns of which pass round the drums, so that as the latter revolve they wind up the cable, moving the car along at a speed proportionate to the rate at which they turn. At each end of the car is a tension device, consisting of a pair of positively driven rolls, between which the cable passes, the rolls pressing against the cable and keeping it taut between the tension devices and the drums, so that the cable cannot become uncoiled on the drums. As there are several coils on the latter and the coils cannot possibly slip, the drums being positively driven, it will readily be evident that as long as the engine is connected to the driving mechanism the car is bound to travel ahead and haul its load, provided the latter be within its capacity to move. In use the cable takes care of itself and shifts to accommodate itself to the path in which the machine is steered. Each end of the cable is fastened to a pulley and the pulley rides along a cable arranged transversely to the propelling cable. The machine is provided with a steering wheel, the operating gear being somewhat similar to that regularly employed on automobiles.

When the machine is steered so that it rides along the propelling cable in a line at right angles to the end cable, the pulley lies still on the end cable; but when the machine is steered to the right or left to avoid an obstruction, the machine will

REAR VIEW SHOWING CABLE AND MACHINERY IN TOW.

draw the propelling cable into an angle with the end cable, whereupon the pulley naturally rolls along, carrying its end of the main cable to a point directly opposite the machine. In traveling back and forth across the field, the cable is shifted in this manner. This shifting action does not actually occur until the machine has approached somewhat close to the pulley, for when there is a long amount of the main cable on the tension side the weight of the cable and friction of moving it sideways on the ground prevents such movement. At all times, however, a short amount of cable immediately in front of the machine always swings to the right or left, when necessary, to suit the steering of the machine.

The machine is equipped with gearing for reversing the drums to propel the machine backward along the cable, but the steering is difficult in such method of backward travel and in use the machine is turned around at each end of the field, so that it travels forward each time it traverses the field. To accommodate this, and to obviate the necessity of disengaging the cable from the drums, or of swinging the whole cable end for end, the main cable near each end has a section which is separable from the cable and forms a detachable link.

The machine when at either end of the main cable stands over the separable section or link, the latter then being wound around the drums and extending at each end somewhat beyond the machine. Then by unhooking both ends of the short section from the main cable, the machine is turned around, taking the section with it, and the section thus reversed by the machine is hooked into position again in the main cable, whereupon the machine can proceed forward. It may also be driven by its own wheels.

Two sizes of these machines are being made, the smaller of which is equipped with a 24-horsepower Frayer-Miller air-cooled engine, while the larger size has a 50-horsepower engine of the same make, the weights being 2,000 and 3,000 pounds, respectively.

Tests have shown that the capacity of the "24" is twenty-four acres a day of ten hours, the operations of plowing, harrowing and seeding being carried on simultaneously. For this work the cost of fuel has been figured at \$1.50, with \$2.50 for a man to run the machine and \$1.50 for a helper, or a total of \$5.50, which figures out at 25 cents an acre.

The daily capacity of the larger machine is 36 hours and the expense figures out at about \$6. A pulley is installed on the front end of the machine directly over the forward axle, so that it can be used for threshing, pumping, or any of the many operations for which power is necessary on a farm. It can also be used for hauling and can pull a number of loaded wagons according to their weight and the nature of the roads. The capacities mentioned above are based on an average speed of three miles an hour, the small machine working a swath 8 feet wide, while the larger one works 10 feet, or if the ground has been broken previously, 16 feet. Four speed changes and reverse are provided on the drums, and the same is true of the traction and belt pulley, giving the vehicle speeds of from one to eight miles an hour.

The posts at each end of the field are placed 200 feet apart. It takes a man as long to change this end cable as it does to walk 400 feet, as it is simply unhooked from one, hooked over on the other, and then it is ready for another day's work. If at any time it is desired to run the machine out of the field, it is run up to the end and the small section unhooked, run out of the field on the traction power, only carrying enough cable to string through the machine, and after doing this the machine can come back and hook on to the cable and go right back to work where it left off. The cable used is 7-16 inch in diameter, with a breaking strain of 6,800 pounds, and the machine will pull all the cable will stand. Some of its other uses are in rooting out stumps and as power for housemoving. The photographs were taken on a bean ranch near Los Angeles.

# Morris, Parks' 24" won by a Foreigner

By W.F. Bradley

START OF THE 24-HOUR AT MORRIS PARK, THE WINNER BEING A RENAULT FROM FRANCE, DRIVEN BY LA CROIX AND BERNIN.

THE most remarkable feature of the 24-hour race at Morris Park track, New York City, last Friday and Saturday, was the ease with which Paul Lacroix and Meurice Bernin, driving a 35-45-horsepower Renault, rolled up their score of 1,079 miles, beating the Brighton Beach track record by 82 miles. At the extremity of the "24-hour camp" the Renault tent contained the usual equipment—tools lined up with military precision, tires, jacks and oil and gasoline cans—but they were never brought into use. Taking one of the turns at speed a rear tire blew out; it was replaced in two minutes, for Michelin dismantlable rims were used. The only other visits to the tent were to replenish the gasoline and oil supply, the broad leather strap holding down the racing hood never being unfastened, and three of the tires which started on the machine being there at the finish with their steel-studded surface in good condition.

One hundred and seven miles behind the victor came No. 21 Lozier, driven by Smelser and Linkroum, with a score of 972. No. 6 Hotchkiss, delayed two hours by a fire caused by a smoker in the paddock, secured third place with 892 miles; fourth position fell to the Allen-Kingston, a newcomer to the automobile world, with 681 miles to its credit. The others—a Packard, a Matheson, and two Dietrichs—had retired from the grind.

Owing to some delay in lighting the track, the nine competitors were not sent away on their night and day struggle until 9 o'clock, or one hour later than the advertised time. The teams were:

No. 1.—60-horsepower Dietrich, Frank Fuller and Chas. Barton.

No. 2.—60-horsepower Dietrich, George Mack and Thomas McMahon.

No. 3.—60-horsepower Matheson, J. B. Ryall and Charles Riffenberg.

No. 4.—30-horsepower Packard, Wallace Owen and Clarence Doty.

No. 5.—45-horsepower Renault, Paul Lacroix and Meurice Bernin.

No. 6.—35-horsepower Hotchkiss, H. J. Kilpatrick and Harry Harkness.

No. 8.—60-horsepower Lozier, H. Michener and Ralph Mulford.

No. 9.—35-horsepower Allen-Kingston, A. L. Campbell and E. H. Belder.

No. 21.—40-horsepower Lozier, L. W. Smelser and William Linkroum.

Fuller's Dietrich set the pace, leading at the end of the first lap, with No. 8 Lozier second and Bernin on the Renault third. When one hour had elapsed Michener's Lozier had the lead with 48 miles, the Renault was second with 45 miles, the Packard third with 43, and Dietrich and Matheson tied with 40.

The additional length of the track, 1.39 miles, compared with the even mile at Brighton Beach, favored the racers, but complicated the scoring. The surface, too, though not in perfect condition, was slightly better than that of the race track four weeks ago, and there was not so much soft loose earth on the turns to bother the drivers at those points.

At the end of the second hour No. 8 Lozier had made the creditable performance of 100 miles, with Packard and Renault behind it, each with 92 miles. When the third hour had elapsed Michener's Lozier had added 43 miles more to its score, and Packard had got ahead of the Renault by one mile, their respective scores being 139 and

138. Fuller's Dietrich faltered early, its mileage for this hour being but six.

Ryall's Matheson was the first to abandon the game, for during the second hour a connecting rod stud bolt broke, causing such damage to the motor that a repair on the track was out of the question. About one hour later the Packard, after doing some fast work, went out of the game with a broken rear axle, leaving but seven competitors on the field.

Bernin got his lead during the fourth hour, when he ran up 179 miles and

OWNER LA CROIX AND PILOT BERNIN BESIDE THE RENAULT WINNER.

TRACK SUPT. CAMACHO UTILIZED A FORD RUNABOUT.

left the Lozier seven miles in his rear. From this point to the end the Renault was never harassed by any competitor. During the night Bernin handled his machine cautiously, yet kept it going at such a regular even gait that, though slightly throttled down, he gradually drew away from the field.

Paul Lacroix relieved Bernin at 6 A. M., when the Renault was four miles ahead of the Jackson record made at the Brighton Beach track. With daylight it was possible to appreciate the masterly handling of the machine, Lacroix refusing to be hustled by machines which occasionally did faster sprints, and rolling off lap after lap with the regularity of a chronometer. As he neared the end of the straight opposite the grandstand, the engine was

of screwing down the cap when the machine became enveloped in flames. Some one among the large number of idlers about the paddocks struck a match within a few feet of the machine. In all probability this was sufficient to ignite the gasoline vapors around the car and communicate the fire to the machine. Though little damage was done to the mechanical parts, nearly an hour was lost in getting the machine on the track again. Later the gasoline tank supports showed weakness as the result of the fire, causing another delay of one hour. But for this the Hotchkiss mileage would have been considerably increased.

Lozier had a series of ill-luck; No. 8 lost 35 minutes through the breaking of a front wheel and two hours as the result of a leaky gasoline tank, which had finally to be replaced by one taken from a touring car on the grounds. Soon after 9 o'clock on Saturday morning No. 8 Lozier broke a steering knuckle and went through the fence. Some of the spokes of the left front wheel had loosened shortly before one of the turns, and their weakness brought about the defect in the steering gear which put an end to the car's career in the race.

About the same time No. 21 Lozier, then being driven by Linkroum, skidded seriously on the upper turn and dropped down a six-foot embankment. Although apparently in good condition, and able to run down the course, the Lozier had to leave the track for repairs to be made to its frame, the forward cross member having been cracked. The radiator, too, was damaged.

**Stopped to Put Turns Into Condition.**

Nothing further of interest marked Saturday's run until 2 o'clock, when the race was called off for a couple of hours to allow the turns to be put into better condition. Five cars, the Renault, Lozier, Hotchkiss, Allen-Kingston, and Dietrich lined

Packard, 30.....43	92	Broke axle.																						
Matheson 60.....40	54	Broke connecting rod.																						

always cut out for the turn, and at exactly the same spot on each round the driver's foot was seen to press down the accelerator pedal. At times one of the Dietrichs or the Loziers would rush around the turn and cut in ahead of the Renault to the excited cheers of the crowd; but Lacroix refused to be moved, and though having power in reserve maintained his uniform average from beginning to end.

One of the few exciting incidents of the race occurred during the fourth hour when the Hotchkiss took fire. The gasoline tank had been filled and one of the helpers was in the act

up opposite the grandstand, the Renault in the lead with 779 miles to its credit, being 79 more than the Lozier, No. 1 Dietrich, though announced as still in the contest, remained in the paddock during the two hours, undergoing repairs.

At the end of the twentieth hour No. 2 Dietrich retired in a disabled condition, the driver declaring that a pin had dropped out of the timing gears. No attempt was made to repair the car and before the end of the contest it was hitched to another machine and towed home. Before 10 o'clock Fuller's Dietrich No. 1 ran into the paddock, with the driver shouting excitedly for a light. A large hole had been blown in the right hand side of the water jacket of the two rear cylinders. This was the end of a series of accidents; one road wheel had broken, the clutch had been changed, the radiator had sprung a leak, and the engine had been overheating for the last two or three hours. Only a quarter of an hour before the accident the car had run into the paddock to cool off the radiator and take in more water. Fortunately the driver and mechanic escaped injury when the portions of metal flew into the air.

On starting the race after the afternoon interval the Hotchkiss car accidentally backed into the Allen-Kingston, injuring the radiator and cracking the side frame. On a protest being filed the committee allowed the car to be repaired, granting it 98 miles, based on its average running prior to the mishap.

Less than an hour from the finish, the Renault, then driven by Bernin, was signaled to stop at the grandstand and was informed that there were but 62 miles to cover to equal the non-competitive track record established by Clemens at Indianapolis

PARDINGTON AND WEBB OBSERVE FROM AN ELEVATED PERCH.

two years ago. Had he known his position earlier Bernin might have broken both the competitive and the non-competitive records, for since his lead was assured he had been driving at an easy gait, or as he expressed it in his native tongue, *à la papa*. The car's average for the twenty-four hours was 44.95 miles. At the end of six hours its average was 45.1 miles; at the end of the twelfth hour it was exactly 46 miles an hour.

The winning machine was a 35-45-horsepower runabout, 1907 model, having all the external features of the 120-horsepower racing car with which Szisz was first and second in the last two Grand Prix races. The motor and transmission were of standard type. Michelin steel studded anti-skid tires mounted on Michelin dismountable rims were employed.

With the exception of the Renault all the cars in the twenty-four-hour race were fitted with Diamond tires. The Matheson and Dietrich No. 1 used in addition Crescent rims. There was a general absence of tire trouble and a decided improvement in the manner in which changes were made. Work generally was done in a much more systematic manner in the paddock than was the case at Brighton Beach. Unfortunately, however, there were still too many idle sightseers around.

No doubt was allowed to arise as to the intention of the organizers of the meet to give the announced prizes, the silver cups being on exhibition near the judges' stand, and a certified check for \$1,000 being displayed at the start by A. R. Pardington, acting chairman of the A. A. A. Racing Board. Credit is due to A. F. Camacho, track superintendent; A. B. Tucker, racing secretary; Alfred Reeves, chairman of the racing committee, and Engineer William B. Spencer for the very successful handling of the event. Announcement was made that another twenty-four-hour race will be held in three weeks, when all the minor defects of an initial meeting will be removed.

#### Results in the Other Events.

In the Friday afternoon race of 36 laps, or about fifty miles, there were seven starters, as follows: Frank O. Fuller, Dietrich; George Mack, Dietrich; Meurice Bernin, Renault; A. L. Campbell, Allen-Kingston; Arthur Warren, Stearns; George Robertson, Dietrich; and William Swan, Stearns. Mack led for the first three laps, with Warren second and Robertson third. In the seventh lap Robertson took second place from Mack and held it until the sixteenth lap, when a leaky tank put him down and allowed Mack to get second place again, Bernin on the Renault being third. Mack's Dietrich won the race in 56:49.4, Bernin's Renault being second in 1:00:35 and Campbell's Allen-Kingston third in 1:13:6.4.

George Mack won the four-lap invitation handicap for Dietrich cars in 6:56.2, Arthur Reppingill, starting scratch, was second, and Arthur Rowley was third.

J. B. Ryall on a Matheson defeated Wallace Owen in a Haynes by about three-quarters of a mile in a four-lap match race, time 6:17.2.

For the flexibility test there were five starters. The B. L. M. and Hotchkiss were disqualified for stopping in their slow mile. Result was: Phil Hines, Pope-Hartford, 378 points; William Swan, Stearns, 273 4-5 points; A. L. Campbell, Allen-Kingston, 98 4-5 points.

George Robertson made an attempt to lower the mile record with the Hotchkiss Vanderbilt Cup racer. His time was :59 1-5.

During Saturday afternoon's interval Arthur Rawley on a Dietrich, won the obstacle race, run off in two heats and a final. In the auto polo match the same Dietrich was victor.

An unsuccessful attempt was made to lower the Christie and Chevrolet mile track record. George Robertson in the 1906 Vanderbilt Cup racer scored 54 2-5 seconds; Montague Roberts in the Thomas Vanderbilt racer was clocked in 60 1-5 seconds; Hemery's Vanderbilt Cup winner, driven by William McCulla, burned out its clutch leather on the trial run and was unable to do better than 1:34.

THE SIGN WHICH EXPLAINS WHY THE MEET WAS HELD.

## STOCK CAR RACE ON LONG ISLAND.

The Metropolitan Automobile Association, through its president, T. F. Moore, on Monday last applied to the Board of Supervisors of Nassau county, in session at Mineola, Long Island, for the use of the Vanderbilt Cup course of 1906, such permission to include the holding of a two days' race for American stock touring cars, dates to be October 16 and 17, between the hours of daylight and noon, with 250 miles contested each day. The Supervisors took the application under advisement and asked the petitioner to supply more details concerning the management. A definite decision will be given in the near future.

The Metropolitan Automobile Association is the same organization which conducted the Fort George hill climb, August 3, in New York City. Mr. Moore, in his statement to the Nassau Supervisors, said that the association would bear all expenses in policing the course and guarantee the safety of the citizens. It is understood that Mr. Moore's plan would embrace the employing of 500 Pinkerton detectives.

The tentative conditions call for an entrance fee of \$500 for each car, with a manufacturer limited to three cars. The trophy is to be offered by a "prominent sportsman" not named, and according to one daily paper "will be competed for by American stock cars only." Another daily announces that foreign stock cars will also be admitted to the contest.

The impression prevails that the Nassau county officials may exact conditions from the Metropolitan Automobile Association which its originators may find somewhat difficult to comply with. Prominent A. A. A. officials who have been connected with previous Vanderbilt Cup races are unanimous in the belief that there should be no road race except over a course guarded by soldiers.

Nevertheless, not a few manufacturers are interested in the holding of a race, and it is a certainty that it would attract many thousands of people to Long Island, possibly prove a success, and possibly be conducted without any fatal accidents. But the task is a trying one, according to those who have had previous experiences, and the belief exists that the promoters do not appreciate the amount of work involved.

## NO DECISION YET IN CHICAGO "24"-HOUR MESS.

CHICAGO, Sept. 9.—The Chicago Automobile Club's special committee, consisting of Sidney S. Gorham, L. E. Myers and N. H. Van Sicklen, has not yet made its report to the board of directors of the club in reference to the much-discussed and criticised 24-hour race of July 12-13. The committee has not yet examined all of the witnesses.

At the meeting of the enlarged racing committee, held last week, it was decided that the club would hold another 24-hour race at the Harlem track and make it the best managed competition of its kind the country has ever seen. Tentative dates were selected for September 27-28, the event to be open to both steam and gasoline cars, and to be of the single-car variety.

## MORRIS PARK'S SECOND 24-HOUR RACE.

That automobilists are enthusiastic for a 24-hour race is proven by the rush of entries made Tuesday when it was learned that the next twice-around-the-clock event would be held at the Morris Park track, New York City, September 27 and 28. A thousand dollars in gold coin will again be given to the winners, with gold medals to the winning drivers, and in addition it is planned to give a \$20 gold piece to the car making the greatest number of laps each hour during the afternoon and evening of Saturday.

At a meeting Monday night, it was decided to make a number of changes. The paddock will be entirely fenced off, and each crew will be supplied with a colored badge. The signboard will be made four times as big, and instead of the regular announcement there will be a cinematograph telling all about the race, besides showing automobile scenes and famous contests.

## CHRISTIE INJURED AT PITTSBURGH.

PITTSBURGH, Sept. 9.—Although one man had been killed and another badly injured in the event just preceding his appearance on the track, Walter Christie attempted to lower the track record of 58 seconds on the Brunot's Island track to-day in his 140-horsepower Grand Prix racer. The event in question was a 50-mile endurance run in which there were twelve starters. After having made several laps at good speed, Rex Reinertson, of Pittsburgh, who was driving a Haynes, upset on one of the back turns owing to a tire coming off. His mechanic, Clarence Bastion, was hurled clear of the car, but he was pinned beneath it. Despite the serious nature of the accident, no attempt was made to stop the event, and ten more laps were run off before it was called at the demand of Mayor Charles F. Kirschler, who compelled the referee, Congressman J. F. Burke, to stop it. Reinertson and his mechanic were hurried to St. John's Hospital, Allegheny, where the former died soon after, and it is thought that Bastion's chances of recovery are slim.

More than 4,000 spectators had gathered to witness the first of the two-day meet, but the crowd was not anxious for more after Reinertson's accident, and Barney Oldfield, who promoted the meet, gave an impromptu mile exhibition against time. Christie then came on in his front-driven racer. The track was in excellent condition, and he was confident of easily lowering the record by a considerable margin; he drove a preliminary warming-up mile, the latter half of which was covered in :24 flat, the car going by the stand with a rush. Reinertson's car had been shoved to one side, but did not clear the track, and a projecting end of the frame caught Christie's forward right wheel, causing his machine to fly into the air. He was hurled some distance, landing on his back, which was severely injured, his wrist broken, and his right eye cut by his goggles. The crowd swarmed on the track and the police were helpless, so that it was some time before Christie could be removed to St. John's Hospital.

## CHRISTIE SAYS HE IS THROUGH WITH RACING.

PITTSBURGH, Sept. 10.—Walter Christie passed a fairly favorable day at the hospital. He is suffering from a broken wrist, a lacerated head, a sprained back, and injuries to his abdomen.

Mr. Christie stated that he had been thinking matters over, and had decided that he would not return to the race track. "Not because I have lost my nerve," he said, "but because I don't think that my wife and relatives will permit it."

Only the first race was pulled off to-day, on account of the rain. An enormous crowd had gathered, drawn by the excitement of the previous day.

## CHRISTIE "STARRED" AT THE MINNESOTA FAIR.

MINNEAPOLIS, MINN., Sept. 9.—In the automobile races held on the Hamline track Saturday in connection with the Minnesota State Fair, Walter Christie went around the mile circle in 52 seconds, equalling the world's record made by himself at Boston and breaking the Minnesota record of a mile in 56 3-5 seconds, made by Barney Oldfield. The races were held under the auspices of the Minnesota State Automobile Association.

The big event of the meet was Christie's effort. His driving on the first corner was a wonder. He took the chance of a skid and carried the pole right around under his arm, going to the first quarter in :13 1-4, repeating the same daring performance at the second turn, and sweeping by the half-mile post in 26 seconds. Then came a bad stretch of track, and 39 seconds were gone when he reached the three-quarter mark; and then he struck a tremendous burst of speed, which carried him by the judges' stand with a record of 52 seconds.

Fast time was made in almost all the events, the liveliest being the five-mile contest for professionals, won by Christie.

Asa Paine, F. M. Joyce and L. A. Wood composed the board of referees.

## ANOTHER CHAPTER OF SELDEN LITIGATION NEWS

### "SELDEN '77 BUGGY PROVES ITS PRACTICABILITY"

From A. L. A. M. Publicity Bureau.

BROADWAY and Forty-ninth street was the scene of unusual activity Friday, September 6, when another demonstration of the original Selden gas buggy was given. The infringers of the patent have for some time been skeptical as to the practicability of the car and its ability to run either on flame or electrical spark ignition. The case, which has been in the courts for many years, has attracted widespread attention in the automobile industry, and as a decision is expected very shortly there is a renewed interest in every demonstration. The infringers of the patent, against whom suits have been brought for infringement, base their defense on the claim that the car built by Selden in 1877 was inoperative and impracticable for road use in any form, and that the car could not be run by its own power.

Several demonstrations to prove that it was practicable have been given, especially the one at the Guttenberg race track several weeks ago before the attorneys and experts for the defend-

"THE ORIGINAL SELDEN GAS BUGGY."

During its trials in and about Forty-ninth street, New York City, Paul Lacroix, American manager for the Renault Freres Co., and Emile Lamberjack, of Paris, were given an opportunity of trying out the first Selden vehicle, which was put through its various paces before an interested assemblage of spectators.

ants and complainants. At Guttenberg the car made a creditable showing, proving that it was operative to a degree which was far beyond the expectations of many of the observers. As that demonstration was made in private, many people believed that the car had not proved the claims of the owners of the patent.

Friday's demonstration again proved that the old car, with its original cylinders, pistons, etc., was capable of doing what the inventor expected it would. It was first run on flame ignition up and down the street, and later run on electrical spark to show its versatility. Up and down the street, through a labyrinth of modern automobiles, trucks, and interested spectators the first automobile of a compression type ever built was run. To show its operativeness, the car was reversed, turned around, and backed up several times, much to the surprise and humiliation of those who have belittled the work of an inventor who had been able to make and operate a car fifteen years before anyone else and whose original invention is operative thirty years after.

There were many interested witnesses who were surprised at the showing made by the old buggy, not the least being Paul Lacroix and E. Lamberjack, of Paris, who saw the car in operation for the first time. They were also given an opportunity of testing the weight of the claims of its backers with regard to its running powers by getting in and running it themselves.

### "FORD FOLLOWERS SCORE ANOTHER VICTORY."

Sent by Ford Motor Company.

HENRY FORD and his followers scored another victory yesterday in the so-called Selden patent suit when his Lenoir car, built from patents issued in 1865, traveled about four times as far and four times as fast as what has been termed the Selden machine. The contest was held on Forty-ninth street, between Broadway and Eighth avenue, in the presence of about 100 spectators, including counsel and experts on both sides of the four-year-old suit which is claimed to involve the rights of the biggest proportion of the American manufacturers to make gasoline cars. Messrs. Cunz, Betts, and Gibbs represented the Selden side, with Messrs. Parker, Murray, Duryea, and Prof. Carpenter representing the Ford.

It was a case of 1865 beating 1877 without the slightest trouble, even when the Selden car ran, which generally was only for a few minutes at a time. In four and one-half minutes it stopped three times and in some cases would not run more than half a minute,

FORD'S REPLICA OF FORTY-YEAR-OLD PATENTS.

To refute the testimony of Dugald Clerk in the Selden action that a Lenoir engine could not be built light enough to operate a road vehicle, Henry Ford built this replica with a Pestugier carbureter, the patents on this and the engine dating back to 1865, antedating the Selden invention by a number of years.

while its longest trial was four and three-quarter minutes and its greatest speed 6 1-4 miles an hour. Once it ran the length of the Forty-ninth street block from Broadway to Eighth avenue, but was easily passed by the Lenoir—1865. The Selden test was claimed to be under flame ignition in accordance with the patent papers.

It was not expected that the Lenoir car would be on hand for the comparative tests, but Mr. Parker had brought on the driver from the Ford factory in Detroit. The Lenoir, which is claimed to antedate the Selden engine, ran with two people from the garage to Ninth avenue, and then to Sixth avenue, crossing ten car tracks. In accordance with the ruling of the trial, its spark was fastened in one position so there could be no advancing of the spark. A request that the Selden car cross the tracks was refused. Then the Ford people offered to race the Selden car a 50-mile race, giving it a 45-mile start over the Lenoir. This, too, was declined. It was noticed the Selden car started only when facing down the street grade, and was always pushed around to that position before any attempt to start it was made.

The Ford people claim yesterday's trial not alone proved the superiority of the Lenoir 1865 over the Selden 1877, but that the latter was not practical in any sense, and that even with constant nursing and fussing it will only amble by fits and starts.

## CLEVELAND'S SEALED BONNET TEST.

By W. F. BRADLEY.

CLEVELAND, O., Sept. 10.—The Cleveland Automobile Club's three-fold automobile competition has practically resolved itself into a single event owing to the lack of support from manufacturers and dealers. The electric vehicle contest failed to draw any entrants, notwithstanding the fact that Cleveland possesses a greater number of private electrics than probably any city in the country; the commercial vehicle test only appealed to two firms, the Gaeth and the American Motor Truck Company, the latter's truck competing while performing its ordinary duties.

Eight touring cars started from the Hollenden Hotel at three-minute intervals this morning in the sealed bonnet test:

Bulck, 2-cylinder; driver, George Bettissi.  
 Bulck, 4-cylinder; driver, J. T. Trumbull.  
 Mora, 4-cylinder; driver, J. W. David.  
 Gaeth, 2-cylinder; driver, Paul Gaeth.  
 Cartercar, 2-cylinder; driver, B. J. Carter.  
 Jackson, 2-cylinder; driver, R. Burman.  
 Cartercar, 2-cylinder; driver, A. W. Mall.  
 Jackson, 4-cylinder; driver, C. D. Paxson.

In the morning the 80-mile run to Ravenna and back, most of it in drenching rain, which made the confetti trail difficult to follow and often reduced traction to a vanishing point, was successfully undertaken by all but the four-cylinder Jackson.

After half an hour's control at the clubhouse an easterly run was made to Mentor and home, distance 58 miles, at an average of nearly 18 miles an hour, over very bad roads.

Only two cars, the Gaeth, driven by Paul Gaeth, and the four-cylinder Buick, handled by J. T. Trumbull, came up to the high standard of efficiency demanded by the contest committee. The Mora came in on time, broke no seals, and had no adjustments, but lost 25 points for an accidental stalling of the engine when endeavoring to pass other cars stuck on a bad piece of road.

No. 22 Cartercar lost 1 hour 18 minutes repairing a broken gasoline feed pipe. Its companion, No. 21, came in on time, but decided to change a bent front axle. The operation, performed under the eyes of the officials, occupied twenty-four minutes at the rate of five points per minute. The two-cylinder Buick strayed from the route—an easy matter in the heavy rain—dropped into a hole and broke a link in the driving chain. At 9 o'clock neither of the Jacksons had appeared, one being reported out with a seized bearing, the other struggling with an exceptionally bad tire.

Official announcement of scores has been deferred owing to the elaborate system of penalization. Breaking the seals entails a loss of 50 points each time, stopping the motor costs 25 points, adjustments are charged 5 points per minute, and cars have, in addition, a running schedule. Time lost on tires or putting on and taking off chains is allowed for. An account is being kept of gasoline and water used and will form a special table. Good work was done around the city by the Gaeth delivery wagon, driven by J. Blatt, as well as by the American truck under the care of Mr. Lurch.

## A. L. A. M. DISCUSSES ALCOHOL AND TIRES.

Hartford, Conn., was selected as the place for the meeting of the Test Committee of the Mechanical Branch of the A. L. A. M. Denatured alcohol and tires were the subjects.

At the morning session, Irving Buck, the chemical expert of the United States Alcohol Company, delivered a lecture on the subject of alcohol and gasoline and submitted to the committee a report of the results of his experiments, which prove that alcohol may shortly be a factor in the propulsion of autos. Action was taken by the committee to assist in a more exhaustive study of alcohol as a fuel, and a specially equipped power plant is to be installed. The first experiments, however, will be conducted with the various carbureters now in use and which will be attached to a Thomas "40" motor, used for engine tests at the

Hartford laboratory. At the conclusion of the chemical and efficiency tests on the motor, special vaporizers will be used and practical road tests given. The experiments so far have resulted in a reversal of opinion as to the starting properties of alcohol.

Part of the afternoon session was devoted to the subject of tires, and a very interesting demonstration was given of the new Dow tube—a non-deflation tube, which promises to eliminate many puncture evils. It has a double walled tube between the air chamber and shoe, which is filled with a plastic material with self-healing properties. When a tire is punctured and the object has been removed, the air pressure inside the tube immediately causes this plastic material (which is mixed with fiber) to flow through the opening from the inside. As soon as this flow begins, the hole is effectually and permanently sealed. To give the engineers a practical demonstration of the tube, the inventor and Secretary Clarkson made the run from New York. Before the start six punctures were made, the spike being withdrawn each time. Four nails were placed in the same shoe and left in during the entire run of 115 miles. In the presence of the engineers these nails were withdrawn, with practically no loss of air.

## DRAGON TRANSCONTINENTAL TRIP IN PROGRESS

SAN FRANCISCO, Sept. 5.—The general run of excitement in automobile circles was punctuated yesterday by the departure of

DRAGON: LATEST TRANSCONTINENTAL CANDIDATE.

Charles D'Arcy, the head of D'Arcy, Scott Company, with a crew in a Dragon stock car to attempt to break L. L. Whitman's transcontinental Franklin record of 15 days 6 hours. The start was made on the 4 p.m. ferryboat for Oakland, where the car really took to the road. The time schedule on which the car will travel has been kept a secret. In fact, D'Arcy, having never tried such a long run, has no definite idea of the ability of himself and his crew as cross-country drivers, but, having great faith in his car, has felt that the record could be lowered. He has had very little to say of the trip, preferring to await results before making any statements. The route to be followed on the trip will be over the roads running as close as possible to the Central Pacific, Union Pacific and Chicago and Northwestern railroads. From Chicago they will follow the Lake Shore railroad to New York. Besides D'Arcy, there are T. Martenstein, Frank Sexton and Ben Turner.

RENO, NEV., Sept. 7.—The Dragon car engaged in a transcontinental trip to New York City met with an accident in the Sierra Nevada mountains. Descending a steep decline and to avoid going over an embankment, D'Arcy, the driver, ran the car into the rocks. The front axle and wheels were badly damaged, but repairs were accomplished and the car resumed its journey. At time of accident the Dragon was nine hours ahead of record.

## SOME MYSTERIES OF THE CARBURETER

By CHARLES B. HAYWARD.

FROM a popular point of view there is nothing quite so mysterious about the operation of an automobile as the carbureter, and it must be conceded that its appearance and its functions are well calculated to mystify the uninitiated. What manner of "works" might this odd-looking contraption of brass, that sometimes takes the form of a mortuary urn and at others bears close resemblance to a cooking utensil, conceal within its grotesque outline? Mind you, I am speaking of the man who has never seen a carbureter dissected, and there are hundreds who have driven cars for a season or more who have never participated in one of these interesting seances. But there are in addition many hundreds, doubtless, who have viewed one of these mysteries reduced to its elements without being very greatly the wiser as to its construction or manner of working. Gasoline enters it by a most insignificant-looking tube, though nine out of ten of the gentry in question couldn't tell for the life of them how the gasoline does get into it. At the other end it leaves through a bulky outlet, totally disproportionate to that constituting its entrance. What magic process has it undergone in the interim?

For some reason or other automobile manufacturers have aided considerably in the shrouding of this essential of the car in mystery, and, strange to add, they are still doing it. Ask a representative maker, who does not buy his carbureters from a parts manufacturer, what type he is using, and nine chances to one he will reply "float-feet, automatic compensating," or something that means about as much either to the poorly-informed or to those thoroughly conversant with this branch of the art, for, with very few exceptions indeed, all carbureters are of the float-feeding order and all are "automatic-compensating," or at least their creators would have intending users believe so. The automobile manufacturer exhibits a decided reluctance to revealing the "innards" of his carbureter in numerous instances, although both he and, in all probability, his inquirer is quite well aware that it embodies nothing whatever out of the ordinary.

### Usually a Very Simple Device.

To get back to the man in the street's notion of what our Teutonic friends have very aptly termed the *vergasser*, a word that speaks for itself much more plainly than *carbureter*, it is hardly to be wondered at that so much ignorance and misconception should exist on this subject, any more than it should on that of ignition. Apart from a certain familiarity with its odor in a partly burnt state, and mixed with lubricating oil ditto, as it pollutes the atmosphere, the average man knows mighty little about gasoline, and usually cares less, until he comes to take upon himself the responsibility of owning a car. Compared to the amount of trouble of which it is capable, the carbureter appears to be a most inoffensively simple device, once its elements are understood, and the latter are so few and usually so well put together that the chances of their becoming deranged or of the contrivance as a whole causing trouble would appear to be remote indeed. Yet some of the best-known makers in the country have come to the conclusion that they cannot turn out as good a carbureter in their own works as they can buy from the special parts makers, so that if the manufacturer himself thinks fit to shift the burden to another's shoulders the novice can surely be pardoned some of his density where a clear insight into its working is in question.

In its way, the average carbureter is just as simple as it looks, and its operation is even simpler; but, like so many other *can-be-run-by-a-child* devices, the number of puzzling things that can go wrong with it is certainly amazing. It will play dead, buck, snort and pop, spit fire and perform many other tricks that are amusing and a bit terrifying to the spectator, but far more so to the man at the wheel, who has to descend to diagnose what is to him an ailment as queer as it is perplexing. It will sometimes run the

engine by fits and starts, at others not at all, while there are all kinds of variations and cross harmonics on the scale represented by these two extremes. To sum it up briefly, sometimes it works and sometimes it doesn't, just as is the case with every other device. Ordinarily it is not a very difficult matter to diagnose its ills, once the beginner becomes sufficiently conversant with its mechanism and ways to be able to put cause and effect together and trace one to the other.

### Backfiring a Puzzling Form of Trouble.

Of all the carbureter troubles that have mystified the novices of each succeeding season, probably there is none that has proved so utterly puzzling, as well as alarming, as that of popping or backfiring. This mysterious ailment has a habit of appearing with an irregularity that is disconcerting, and which makes it appear as if it were not the outcome of any particular combination of circumstances, as would be the case were its presence only an accompaniment of certain visible and easily detected symptoms. But it comes and goes unexpectedly, at times reaching proportions that are alarming, particularly when flames shoot out of the air inlet of the carbureter, an occurrence that gives the average driver visions of a conflagration and the smoking ruins of his car. It is difficult for him to understand why this fire should not ignite either the gasoline vapor or the gasoline itself that is in the carbureter at the time, and send the whole car up in flames. Simply because the former does not ignite readily, due to the fact that it is almost pure vapor with little or no air, and the flame passes over the latter at such a speed that it has not time to take fire. Even though the spray issuing from the jet should take fire, the flame could not travel back through the spray-nozzle to the float chamber, and it would be extinguished by the next inrush of air immediately following the backfire. The danger from the latter lies not so much in the fear of setting fire to the contents of the carbureter itself, as it does to something on the exterior and directly in the path of the flame. Bits of oil-soaked waste, the braid of the insulation on the ignition wiring and similar things burn readily, and the heat they produce will cause the gasoline supply to take fire also.

### Causes of Some Common Ailments.

There are three things that may bring about this objectionable ailment on the part of the carbureter—improperly timed valves, a very weak mixture, or a very rich mixture. The first is most easily eliminated, as, if it be at the root of the trouble, the latter will be constant and not spasmodic, as it is with the mixture which varies greatly at differing speeds of the engine, despite the carbureter-makers' emphatic claims to the contrary. In either case the underlying cause is to be found in the fact that the inlet valve opens while the charge is still burning, both a weak and an over-rich mixture being very slow burning. The sustained pressure causes part of the cylinder contents to be ejected through this valve into the manifold and out through the air-inlet of the carbureter, even though the exhaust valve may be open at the same time. Ordinarily there is not more than sufficient pressure to cause the familiar popping noise, the issuance of flames from the carbureter being the symptoms of an exaggerated case of the malady, in which the mixture is so very slow-burning that it is still on fire not alone after the completion of the power stroke, but after its discharge into the air. The remedy is a change in the adjustment of the spray-nozzle to give more or less gasoline, according to the needs of the case, and the chief thing for the novice to learn in this particular is to make haste very slowly. The reason therefor will be apparent by giving the screw an eighth turn upward or the reverse and noting the marked effect on the running of the engine when the adjustment is very close to what

it should be. As this point recedes a correspondingly greater movement of the screw is necessary to produce a marked effect. To find the proper point the nozzle should be closed tightly, so that all adjustments may be made from a known standard. Then open half a turn, prime and try starting; if the motor will not start, try opening a slight bit more until this can be done. In nine cases out of ten the motor will run poorly when first getting under way. The needle should be screwed up or down as little as possible at a time, and a quarter to a half turn will be found to produce an apparent effect on the motor's running. It will either slow down and begin to get weaker or will speed up very appreciably, according as the adjustment approaches or recedes the point corresponding to the formation of the best mixture. While making these adjustments the throttle should be at the customary starting point, and after having got the motor to run satisfactorily under this condition it should be tried at all points of the throttle, from practically closed to wide open. If it fails to respond as readily at the higher speeds as it should, the trouble probably will be found to lie in the working of the auxiliary air-valve, which is a most prolific source of annoyance.

#### Proper Adjustment Is a Simple Matter.

Having found a point of adjustment of the spray-nozzle at which the motor performs satisfactorily at low speeds, it is wise to maintain it before going further by tightening the nut and also marking the point on the screw by a file-scratch for future reference, for many carbureter troubles are due solely to the vibration and hammering to which it is subjected by running over rough roads at high speeds. It is safe to say that carbureter troubles would be halved if it were undisturbed in this way, so that vibration is a prolific source of annoyance that can best be guarded against by a periodic inspection, the value of which will be greatly enhanced if there are guide marks to show the state of affairs at a glance. If the engine fails to show the same satisfactory results at higher speeds, and particularly if it fails to run at a high speed—*doesn't pick up when the throttle is opened*, to put it in the vernacular—the auxiliary air-inlet should be the next seat of operations. Hold this valve open and as a substitute for it place the hand over the auxiliary inlet, uncovering the latter gradually and in about the same proportion as the valve itself should uncover it as the throttle is progressively opened. Then the valve itself should be examined to detect any cause for its failure to respond to the varying speeds of the engine. These are most commonly dirt, too high a tension on the controlling spring, or sticking as the result of a violent bump.

#### A Most Prolific Source of Annoyance.

Volumes could really be written on the idiosyncrasies of the auxiliary air-valve, but the autoist who frets and fumes over its shortcomings to-day, cursing it as an invention of the evil one, should reflect on the condition in which his predecessor of a few years ago found himself before its invention, and if he wishes to enjoy a bit of actual retrospection of this kind he has only to fasten the auxiliary air-valve tight and run the car in that state. Even then his carbureter will work much better than did those of half a decade ago, because a great deal has been learned on the subject in the interim. An auxiliary valve is one of those delicately constituted pieces of mechanism that is a necessary evil under the present system of vaporizing the fuel, and, despite the extent to which it is maligned, the prospect of eliminating it in the near future does not appear overbright, so it is a case of make the best of it. To do this with the least annoyance it is only necessary to apply to it the same system of regular inspection that should be given every other part of the car at stated intervals. Follow the let-well-enough-alone principle of always refraining from disturbing an adjustment as long as it works properly; but this does not mean to overlook it entirely until it breaks down. Railroad companies pay out large sums of money annually for inspection crews, but, in spite of the vigilance exercised in a number of departments, locomotives often go wrong on the road. How then can the

automobile be expected to be immune from the same trouble, when it is not looked after and gets so much harder service with far less care?

#### Most Troubles Are of the Ordinary Kind.

But to come back to the carbureter. Another chapter of ills is to be found under the category of fuel stoppages, and these may be found anywhere from the gasoline tank to the nozzle, so that they are not purely carbureter troubles. Lack of pressure in pressure-controlled systems and lack of gasoline in any kind of a system may be passed over as not coming in any catalogue known to the trouble-man. Autoists are still held up on the road with empty gasoline tanks that it takes them some time to discover, but probably they never do it twice. Some cars are provided with special stop-cocks right at the line side of the tank, in order to permit of the removal of the piping without emptying the tank, and instances have been known where the failure to reopen this cock has occasioned no end of blasphemy. Then there is usually another cock on the line side of the carbureter. So much for those cases of inadvertently omitting to turn the fuel on at all. Then there are water and sediment as enemies of the autoist's peace of mind. Despite the greatest care employed in handling the fuel, the amount of water and sediment that there is in the quantity used in the course of a season is surprising, so that a periodic flushing of the tank and opening of the drain-cock, both in the latter and in the line and carbureter as well, will reveal the potential source of considerable trouble if permitted to accumulate overlong. All the foregoing may be summed up as *keep the tank full and keep it and the fuel system clean*, as it amounts to nothing more.

#### Some of the Usual Mechanical Defections.

Then there are the sundry mechanical derangements of the fuel-controlling devices in the carbureter itself. The float comes first in order, though it is practically immune from defections. If of the cork variety it may become loggy and sink to a very much lower level than that intended, in which case the most effective remedy is its prompt replacement. Or, again, it may lose its protective coating of shellac and begin to disintegrate, in which case there will arise the necessity of making an inspection of the spray-nozzle. It's spindle may become bent, and it requires but a slight amount of disalignment to prevent it from performing its functions properly. The habit of hammering on the priming pin that is so prevalent is conducive to this ailment; hitting the pin a punch with the thumb does not bring the gasoline into the float chamber any quicker, as a slight depression and holding down of the tickler will achieve the same result without risk of damage. Getting out of line will sometimes cause the float to bind on the sides of its enclosing chamber, or it will fail to operate the shut-off valve in the fuel line, for reasons arising out of the same cause. Between the float-chamber and the spray-nozzle is a passage of very small bore in a great many carbureters, and though the remainder of the device may apparently be perfectly free from obstructions, they may lodge here and be overlooked. Then last, but far from least, is the spray-nozzle itself. Here of all places is one of the things that should be let alone unless there is positive demand for its adjustment, and when the latter is necessary it is a very bad habit to screw the needle up tightly, as it is apt to enlarge the orifice in the brass nozzle. These are the majority of the principal forms of trouble that will be encountered with the carbureter, though they may appear in so many diverse forms as hardly to be recognizable from the printed description. The number of different forms in which these various ills may make their appearance is legion, while matters are further complicated by the fact that it is difficult to always diagnose them properly, and they are furthermore frequently confused with defections arising from some fault totally foreign to the carbureter. The most common case of this kind is to be found in attributing loss of power to the carbureter, instead of a weak ignition current or poor trembler adjustment.

# EFFECTS OF WIND RESISTANCE ON SPEED

By JOSEPH A. MACKLE.

LONDON, Sept. 2.—In these days of big covered cars the resistance caused by windage at high speeds is a matter of great importance, and yet one on which but little reliable information is obtainable. True it is that the R. A. C. hill-climb formula takes into account the power absorbed in overcoming this resistance, but the values assumed are more or less arbitrary and seem to favor unduly the smaller vehicles.

Recognizing the need of reliable data, the enterprising S. F. Edge conducted some interesting experiments at Brooklands track last week. A standard 40-horsepower six-cylinder Napier, without body, was equipped with a pair of well-stayed uprights, standing some eight feet high above the frame. To these stays were fastened horizontal laths, each six feet long by two inches in width, and by varying the number and position of these laths different areas were presented to the wind. Fortunately for the accuracy of these few experiments, the slight breeze blew straight across the track, so that there was no opposing head wind. The runs were made over a measured quarter mile on the finishing straight, and the assistance of the R. A. C.'s official time-keeper was invoked to insure accuracy.

On the first run of the series shown in the table below an area of 30 square feet was exposed (in addition to the normal amount of about 112 square feet for car and driver), the maximum speed attained was 47¾ miles an hour. On subsequent runs the area was gradually reduced by amounts of two square feet, and the speed increased step by step till, when the last lath had been removed and the normal surface presented to the wind, a speed of 79 miles an hour was recorded. The seventeenth run had an area of 15 feet square feet, formed by a gridiron arrangements of laths. The time recorded was 15 4-5 seconds, or a speed of 57 miles per hour, showing that owing to the extra skin and corner friction the resistance was the same as if 18 square feet of continuous area had been displayed. This fact is of much interest in demonstrating the speed-reducing effect of a number of small projections on a car. For the final test a total area of

24 square feet was exposed in two sections, the top portion having 13 square feet surface and being separated from the lower 11-square-foot portion by a gap of 6 square feet. The actual effect on the speed was equal to that offered by nearly 28 feet of continuous surface. It will be noted in going through the table that the lowest speed, recorded with the maximum resistance, was 47.85 miles per hour, while the highest speed was 79 miles per hour, a variation of 31 miles per hour merely by the additional wind resistance and with practically no increase in weight. Owners of large limousines, or touring cars with wind shields, must realize the enormous amount of extra work imposed on their engines, and also on their driving tires, particularly when traveling against a head wind.

These experiments deal, of course, with plane surfaces only, and many interesting tests would suggest themselves for determining in similar manner the best shape for front and rear of a fast car. Without doubt, too, the results so obtained would be of great value in their application to the dust-raising question.

The following gives the speeds attained on the various runs:

Run	Area of Screen	Time Over Flying 1-4 Mile	Speed
1.....	30 square feet	18 4-5 secs.	47.85 miles per hour
2.....	28 " "	18 "	50 " " "

## REGISTER OF CYLINDER TEMPERATURES AND PRESSURES\*

IN order to arrive at the amount of heat transmitted to the cylinder walls of an internal-combustion motor, in figuring its thermal efficiency, calculations are usually resorted to in which the temperature of the exploding gases and the specific heats of the gases of combustion are taken as the principal factors; but the extremes to which the former reach have not been accurately established. To ascertain this result more accurately, Professor Bertram Hopkinson, of the University of Cambridge, has devised an apparatus which permits of the measurement of this quantity of heat experimentally. The device, which was the object of a communication to the Royal Society in January last, is composed of a cylinder, 30 centimeters in diameter and 30 centimeters long, lined with wood and closed at each end with plates of cork. The principle upon which the apparatus is based is the variation of the electrical resistance of copper as a function of its temperature, and for this purpose the cylinder contains a spiral band of copper 6.5 mm. long, the turns of which are spaced 1 mm. apart. The spiral is extended at each end by straight strips, as shown in the illustration (Fig. 2), these extensions being for the purpose of connecting it electrically with the remainder of the apparatus.

The cylinder itself, which is shown sectionally in Fig. 1, has an opening at each end, the left-hand one (A) being for the insertion of a spark plug or ignitor, which reaches to the center of the

cylinder, while the other (B) communicates with a pressure indicator. The other openings (O) permit the passage of the electrical connections of the spiral already referred to, the admission of the explosive mixture and its exhaust being accomplished by means of stop-cocks, which do not appear in the illustration. The mixture having been admitted and fired, the consequent rise in temperature produced causes a corresponding change in the resistance of the copper spiral, which is measured by means of the arrangement outlined in Fig. 2. The part of the circuit at the left comprises a battery (B1), consisting of 5 storage

cells, a group of 4 incandescent lamps, wired in series-multiple (L), acting as a resistance, and the copper spiral already described. The other half of the circuit at the right consists of a galvanometer (G) and a resistance (R) of 0.25 Ohm, while connected in shunt with it is a second resistance (R1) and a battery (B2) of 6 cells,

FIG. 1.—Cross sectional view of cylinder.

\*Translated from *La Vie Automobile* by Charles B. Hayward

which opposes the first battery mentioned. The number of lamps in the resistance  $L$  is such that the amount of current passing is eight amperes, while the resistance  $R_1$  permits no current to pass through the galvanometer. Under these conditions, the resistance

FIG. 2.—Electrical circuits of the apparatus.

of the galvanometer being 3.2 Ohms and that of the copper spiral ( $S$ ) 0.14 Ohm, the current furnished by the battery ( $B_2$ ) is 4.5 amperes.

When the explosion takes place the heat produced increases the resistance of the copper spiral to such a slight extent, as compared with the total resistance of the circuit in which it is placed, that the intensity of the current traversing it practically does not vary. On the contrary, the electromotive force within the limits of  $S$  is augmented proportionately to its increase in resistance, so that a current which is proportional at that moment to the increase in resistance traverses the galvanometer  $G$ . The variation of the resistance of copper as a function of its temperature being known, it suffices to measure the deflection of the needle of the galvanometer to arrive at the variations of temperature of the spiral and, in consequence, the amount of heat absorbed by it, its specific heat at these diverse temperatures having been determined in advance. The reading is taken photographically with the aid of a mirror, which concentrates the luminous ray and throws it on a sensitized plate. The pressures reached within the cylinder are shown by the gauge attached to the opening  $B$ , Fig. 1, and, for the purpose of comparison, are recorded photographically at the same time as the deflection of the needle.

### WHAT IS THE CAUSE OF RUST?

A short time ago Mr. Moody, by means of a series of experiments, of which the Central Technical College may well be proud, demonstrated that in the absence of carbonic dioxide rusting of iron and steel did not take place, and thus confirmed a view that was then doubtful, says *The Engineer* (London). The text books had taught that oxygen and water were alone sufficient to cause corrosion. It was proved definitely that more was required than water and oxygen to effect the reaction—an important step. Now another theory, remarkable in many ways, attracts attention. Dr. Cushman, of the United States Department of Agriculture, has been studying for some time the corrosion of wire for farmers' fences, and at the meeting of the American Society for Testing Materials on June 22 he described the investigations on which he had been engaged, and the facts he had discovered. From these he arrives at the conclusion that rusting is not a pure chemical reaction, as we have been taught to consider it, but an electrolytic or electro-chemical one. We have become used to the thought that most chemistry is in some way or another electric. The theory does not, therefore, sound unfamiliar, and we are able to follow Dr. Cushman when he tells us that, according to his view, the first attack on iron is not made by oxygen, even in the presence of water, but by hydrogen in the form of the hydrogen ion. A remarkable feature about this theory is that it

is practically the same as that of the corrosion of alloys, which Mr. Rhodin outlines. Electrolytic action as the cause of the wasting of steel, commercial iron, and other alloys is no new thing, but it is carried a stage further by the introduction of modern theories of dissociation. He (Dr. Cushman) has found that in powerful oxidizing agents like bichromate of potash and chromic acid a valuable material for this purpose exists. Solutions of these salts prevent rusting by "polarizing the iron to the condition of an oxygen electrode," which wards off the attacks of the hydrogen ion. Moreover, steel dipped in such a solution retains its power of resisting electro-chemical action for some time, and since solution is the first step towards the formation of rust, rusting does not take place. How far it may be possible to adopt such a method for the protection of iron and steel structures remains to be seen, and on account of its simplicity it will certainly undergo plenty of tests. Mr. Rhodin adopts a different method, and, by an ingenious system of reasoning, arrives at a bronze alloy which is very slightly corrodible. He effects this without robbing the alloy of high physical properties. If such an end may be reached with an alloy of copper and zinc, may it not also be attained in alloys of carbon and iron? We already know that all steels do not equally well resist rusting, and it requires comparatively little effort of the imagination to think of brands more resistant than any we yet have. With Mr. Cushman's theory before us, and Mr. Rhodin's process for arriving at "balanced alloys," are we wrong in expecting the future to provide a non-corrodible steel?

### ENGLISH WORRIED OVER GASOLINE PRICES.

The time was, and not so very long ago, when the question of petrol consumption was not a serious one, says the *Motor*. This was when we could buy a two-gallon can for 40 cents. To-day 60 cents a two-gallon can is the standard retail price throughout London, and anything between this and 72 cents is asked in the country. That it will advance yet a few pence higher is at least within the bounds of possibility, and it seems to me that any amount of grumbling or protest is not going to avail much. It is simply a case of being compelled to pay the price if one must have the petrol. Grumbling or protesting doesn't make the monopolists turn a hair; in fact, they rather like it as proof of their being indispensable to the motorist. And this is the position of affairs after the endless talk, discussion and study of what is termed "the fuel problem." The motorist is in a worse position to-day than he was in before the subject was broached. The question is, when is anything definite and practical to arise from such discussion? Why could it not be shown conclusively whether benzol is a thoroughly practical alternative? The results of the official long-distance test under observation of what this spirit could do would be worth reams of the academic discussion. I know for a fact that this spirit can be sold retail at 20 cents per gallon, and it certainly seems to be the only reasonable alternative. Let the petrol people once feel the pinch of vigorous competition and the inflated prices will come down with a rush, but as long as a monopoly closely controls the supply of generally used fuel little or no relief is to be anticipated.

The bucking and snorting refusal to start of the gas engine is, states *Power and Transmission*, often due to moisture in the cylinder, preventing regular ignition till dried by the heat of several explosions. The difficulty may be obviated by shutting off the cooling water a few minutes before starting of the engine and not turning it on again until after the engine begins to explode regularly when again started. The hint contained here may be of use to the autoist who has trouble of this nature in cold weather, as with the customary method of bringing the motor to a stop, that of opening the throttle wide and cutting off the ignition after it has run at speed for a few seconds, the cylinders next to fire are left full of gasoline vapor and air, which condenses when the cylinder walls get thoroughly cold and deposits no little moisture.

## LETTERS INTERESTING AND INSTRUCTIVE

### SOME QUERIES CONCERNING MOTORCYCLES.

Editor THE AUTOMOBILE:

[889.]—I would like to have you answer some questions about motorcycles, as I intend to buy one. I wish it to pull up almost any hill without pedaling and be able to run thirty to thirty-five miles an hour on the level. Will a 2 1-4 or a 2 1-2-horsepower, single-cylinder machine do this? Will a 3-horsepower or over cool successfully? Which kind of a drive gives the best satisfaction, the V-shaped belt, the flat belt, or the chain drive? Is slipping common with belt drives? I should think they would stretch and would not hold while out in the rain. Will a motorcycle tire last a season, if not, how long is the average life of such a tire? Is a motorcycle as expensive to maintain as a runabout? Is the non-vibrator coil successful, and would not a vibrator coil be much better? Why are they not used? Are there any motorcycle magazines published, and if so, will you kindly give me the necessary addresses?

A SUBSCRIBER.

Flemingsburg, Ky.

A two to three horsepower single-cylinder machine will probably suit your requirements best. In good running order, it will mount the majority of hills without recourse to pedaling, and is altogether the most economical motorcycle both to buy and to maintain. There is no difficulty in cooling larger motors, as motorcycles of five to seven horsepower are common, and racing machines have been built several times as large as this. The question as to which form of drive is superior is one that still remains very largely a matter of personal opinion. As you have doubtless noticed, machines of both kinds are made in this country, and both seem to run well, though on the whole it must be conceded that the chain is a far more durable device. The number of kinds of belts employed, particularly abroad, where this form of drive is very common, is very great, most of the modifications being designed to overcome the fault of slipping, so that this would appear to be the chief defect.

Whether a motorcycle tire will last a season or not depends entirely upon the service it gives and the care that it gets, though under ordinary circumstances it would hardly seem possible to wear out a tire in the course of an average season's riding, barring accidents.

We have no idea what the average life of a motorcycle tire is, but as many automobile tires, which bear several times the weight and are subjected to much harder service in every way, are good for anywhere from five to ten thousand miles, we should think a motorcycle tire ought to do double this. The expense of maintaining a motorcycle is far less than that of keeping even the smallest of runabouts. The non-vibrator coil has been found to be the most successful, owing to the rapidity of its action as well as its freedom from trouble. Vibrator coils are not used owing to the fact that running over rough roads would soon cause derangement of the contact-making device. *The Bicycling World*, New York, is, to our knowledge, the only paper published in this country dealing with the motorcycle.

### EXPERIENCES WITH SOLID TIRES WANTED.

Editor THE AUTOMOBILE:

[890.]—I am a subscriber to "The Automobile," and desire to obtain all the information possible regarding the subject of solid tires. I have a light runabout, and am thinking of equipping it with solid tires. Can you give me any suggestions that will enable me to get the best?

C. N. PATTY.

Pontiac, Ill.

Not having had any extended personal experience with solid tires in this role, we do not feel competent to answer your inquiry in exactly the form it is made. The question involves the weight of your car, roads to be traveled and other data, which you do not supply. Moreover, it is very largely a matter of personal experience, some autoists praising the use of solid tires, while others condemn them utterly, so we think it will probably be wise to ask any autoists who have tackled the problem to let us hear from them.

### SOME QUESTIONS ON VARIOUS TOPICS.

Editor THE AUTOMOBILE:

[891.]—How many cubic feet of gas will a gallon of gasoline produce if properly mixed for an automobile engine? Also, how can I obtain the names of different garage owners throughout the country? Would it be of any advantage to take up the matter of a muffler cut-out and transmission which occupy one-half to one-third the space at present necessary for transmissions? It can be very easily operated by a lever on the steering wheel. I am considering this from a financial point of view.

N. J. G.

Grand Rapids, Mich.

By gas we presume you mean mixture, and not pure gasoline vapor. There is some data extant on the subject that is not at hand at the moment, but to answer such a question definitely the specific gravity of the fuel, temperature and the like must be known. With the gasoline ordinarily used in automobiles the proportion of air is generally about 8 or 10 to 1, but actually the increment added by the introduction of the gasoline vapor is said to be so small that the number of cubic feet of air used by an engine in burning a gallon of gasoline would probably give an approximately correct answer to your query. Given the cylinder capacity, this could be easily calculated by multiplying it by the number of power strokes in the time required to burn a gallon of gasoline, though this would make no allowance for throttling or small charges. At ordinary temperatures, a gallon of gasoline of the specific gravity generally used nowadays in automobiles will probably produce from 70 to 90 cubic feet of vapor, and eight to ten times an average figure, such as 80 cubic feet, will doubtless give a fairly accurate result.

The best way for you to procure the names of garage owners throughout the country will be to obtain a copy of the Official Automobile Blue Book. Regarding the inventions you mention, if the devices in question are superior to those now generally in use it would certainly be to your advantage to have them placed on the market; but as to the method of doing this, we can hardly be of much assistance to you, other than to advise you to submit them to various automobile manufacturers and get their opinions.

### ADVICE ABOUT ENTERING THE AUTO BUSINESS.

Editor THE AUTOMOBILE:

[892.]—I am anxious to enter the automobile business and would like a little advice upon the subject. I am at present working in a general store, but am mechanically inclined and believe the automobile business is a great field for the right kind of a young man. I would like to learn repairing and driving and later obtain an agency or enter the employ of some company as salesman. I am twenty-three years old and have had five years' business experience after a high school education. I have been a reader of "The Automobile" for some time and would appreciate any information you can give me.

H. H. WOOD.

Enfield, Ill.

To learn repairing and driving, which seem to be the stepping-stone to further advancement in the automobile business, it will be necessary to enter the employ of some manufacturer, garage or dealer. While, as you say, the automobile business is a promising field for the right kind of young man, the advisability of entering it is something which you must decide for yourself; but if you are inclined that way, you will doubtless make no mistake in taking it up.

### INCREASING THE POWER OF A "ONE-LUNGER."

Editor THE AUTOMOBILE:

[893.]—Will you please let me know, through the Letters Interesting and Instructive column of "The Automobile," if the gasoline engine in an Olds runabout, having a 4 1-2-inch bore by 6-inch stroke, can be made more powerful, and to what extent. To do this, should the inlet and exhaust valves be made larger, and how much? Also, how much lift should the valves be given? Or would it be preferable to decrease the amount of space between the piston and cylinder head, which now amounts to one and one-eighth inches? If

so, how much should this space be lessened, and should the plate be put on the piston or on the cylinder head? H. X. MELIN, Galva, Ill.

It is possible to make such an engine produce a slightly greater output than that for which it was originally designed by increasing the initial compression. The easiest way to do this will be to fasten the plate to the cylinder head, thus reducing the clearance. It would not do to attach such a plate to the piston, as it would destroy the balance of the engine. It will be unnecessary to alter either the size or lift of the valves, as compressing the same volume that they are designed to admit and exhaust to a much higher degree will give the desired result, with a minimum of complication. Probably it would not be advisable to decrease the clearance by more than 25 per cent., or approximately 5-16 inch, as this will doubtless give the maximum benefit to be obtained from such a change without unduly cutting down the factor of safety of the remaining parts of the engine. Only a brake test will serve to show how much the power of the engine has been increased.

### INSTALLING GAS ENGINE ON STEAM RUNABOUT.

Editor THE AUTOMOBILE:

[894.]—I would like to know if it would be possible to install an internal combustion motor in the body of a 1903 Locomobile runabout, and what would be the necessary expense of doing so?

Corydon, Ia.

J. T. ROGERS.

It would be quite possible, but the job would be somewhat akin to building a new coat around an old button, and the result would be far from satisfactory. A light, air-cooled motor might be installed and made to run the combination, but it would neither be a thing of beauty nor a joy forever. As to the expense, there is no telling what this would amount to; but doubtless it would be far cheaper in the end to throw the old chassis on the scrap heap and buy a new car.

### INFORMATION FROM HAWAIIAN ISLANDS WANTED

Editor THE AUTOMOBILE:

[895.]—Can you give me any information regarding the automobile business in the Hawaiian Islands? If so, your favor will be greatly appreciated, as I am an expert rubber man, can do anything with rubber, and am thinking of going to the Islands. I use a combination of rubber, cement, and treatments that are known to me only; in other words, I have perfected the vulcanizing proposition, and I want to get in a country where there is the most money—you understand how a fellow feels when he has got a good game. I have been employed by the Nevada Mobile Transit Company for more than a year. My work has been pronounced standard by representatives from every rubber company in the United States. Here in Goldfield during the summer months the heat is something fierce. Yet I have yet to have the first job to go bad. My work has held up on trips through Death Valley when the heat was registered from 140 to 160 degrees in the shade. I have seen new tubes and old tubes blow out a yard long, but never has one of my patches been affected from the heat. If you care to mention me in your magazine, and desire me to do so, I can furnish you with samples of my work to back up my assertion that I am at the top of the ladder in my profession. It has occurred to me that Honolulu ought to be a great town for my line of work on account of the extreme heat. I am a reader of your magazine, and if you can give me some advice in regard to that country and the addresses of the automobile companies there, I would greatly appreciate your favor; also any information regarding Mexico, Cuba, or South America will be gladly received.

Goldfield, Nev.

LEE A. CRAW.

### LONG-DISTANCE TOURING UNDER DIFFICULTIES.

Editor THE AUTOMOBILE:

[896.]—My father, brother and myself have just completed a 2,500-mile tour through the east, taking in Boston and New York, and as we did something of a stunt on the part of the trip between Youngstown, O., and Toledo, I thought it might be of general interest. I was driving a 1906, 40-horsepower Pope-Toledo, and when we left Youngstown on Thursday, August 29, at 7:30 a. m., our transmission was practically gone; that is, we had nothing but the high speed, the first, second and reverse all being out of commission. We arrived in Toledo the same evening, having completed the trip of 194 1-2 miles on the high gear alone. As you perhaps know, if you have ever been over these roads, there are lots of steep and rough hills, especially between Youngstown and

Cleveland, to say nothing of the sand between Cleveland and Toledo. When I started up the hill just across the river from Chagrin Falls, I thought we were done, for I never expected to see the top. We made it, however, and I knew then that the car was capable of getting through to Toledo. It was pretty rough work, nevertheless, for we could not stop on the bumps at the bottom.

Chicago, Ill.

HORACE B. HORTON.

### NEW WAY OF NUMBERING IN TRACK RACES.

Editor THE AUTOMOBILE:

[897.]—No doubt you are aware that the Brooklands Automobile Club has issued greatly improved regulations for the races to be held September 14 and henceforth on the Brooklands track. A new rule to be enacted is in regard to the method of identifying cars, and the regulations state that a disc shall be provided for each competitor's car, two feet in diameter, and that a number shall be painted upon it.

I enclose you a photograph of a six-cylinder Napier with the disc attached, as arranged by Mr. Napier, which may prove inter-

HOW THE NUMBERS LOOK WHEN APPLIED TO THE CAR.

esting to your readers, and which, I think, you will agree with me in saying it will be a splendid method of identification, and enable the spectators to easily identify each individual car. I find by experiment that the numbers can be plainly distinguished from all parts, even the highest point on the course, i. e., furthest away from the track. The Brooklands people are to be congratulated on inaugurating this simple and neat form of distinguishing the cars, without in any way detracting from their speed.

London, England.

S. F. EDGE.

### REMEDY FOR A GREASY RADIATOR.

[898.]—I am enclosing my subscription for one year. I have read with much interest your up-to-date journal, and as I have not seen in its pages the following remedy for greasy radiators, I am sending it along for your approval. I had a very greasy honeycomb radiator, and tried to clean it with hot water and caustic soda, but did not succeed. I then tried the following: One gallon of naphtha poured into the empty radiator, and shook it up and down. Cleaned it all out in two minutes. Of course I had to detach the radiator to do so. It is a most effective cure.

Oatlands, Tasmania.

T. C. BUTTON.

### SOME INFORMATION ABOUT ACETONE.

Editor THE AUTOMOBILE:

[899.]—If your correspondent in the August 22 issue—Letter No. 366—will write me, I will be pleased to give him particulars about acetone and gas storage tanks. For your information, would say that the greatest use of acetone is in the manufacture of high explosive smokeless powder. Thousands of barrels are sent yearly to England and Japan from the United States. Less than 2 per cent. of the production is used for dissolving acetylene gas. It is the greatest solvent of carbon known.

Milwaukee, Wis.

P. C. AVERY.

### THE GREASE THAT TRACY DID USE.

Editor THE AUTOMOBILE:

[900.]—We desire to call your attention to page 334 of last week's issue of "The Automobile," in which you print an inquiry from C. L. Welmer, of Lebanon, Pa., asking what stuff Tracy used in his Locomobile racer in the 1905 Vanderbilt Cup Race. Your footnote in reply to this inquiry, is incorrect. Tracy used Havemeyer Gear Compound, which fact we advertised in your paper at the time, and it was to this very advertisement that your correspondent refers in his inquiry. Mr. Tracy also gave us a letter at the time, stating that he used our compound and that the same was most satisfactory.

HAVOLINE OIL COMPANY.

New York City.

FIRST OF THE 600 DARRACQ TAXICABS FOR NEW YORKERS' USE.

In the competition to supply New York with an efficient fleet of gasoline taximeter cabs, plying for hire at a reasonable figure, Darracq has been victorious. Associated with the French constructor—for the pioneer firm on the banks of the Seine limits its activities to automobile building—is the New York Taxicab Company, with offices at 546 Fifth avenue, and with a temporary garage at 40 West Sixtieth street, near Broadway. The officials of the company announce that thirty-five cabs will be on the streets of New York by the end of the month, and that additions will be made at the rate of sixty per month. Before the end of the winter 300 cabs will be in service, and by next spring the number will have reached 600. Rates of travel by the taximeter will be 30 cents for the first half mile and 10 cents for every additional quarter mile, in any district. Traveling further uptown than 125th street, and not returning, will entail an additional fixed charge; there will also be a supplementary charge for crossing any of the ferries. Waiting time will be at the rate of \$1 per hour.

Two types of gasoline cab have been constructed by the Darracq Company, one with a two-cylinder motor, the other equipped with a four-cylinder engine. For cities possessing well-paved streets, without difficult grades, the former model should be sufficiently powerful; for New York the more powerful car was considered preferable. Starting after some of the French firms, the

REVERSE NEVER NEEDED FOR TURNING IN STREETS.

spring clamps allows the rear axle and gear box to be taken down. Instead of being suspended from the frame, the gear box is carried with the differential on a fixed rear axle, the driving shafts transmitting power only, and not bearing any of the weight of the vehicle. There are three forward speeds, the third having direct drive, and one reverse. Large-size ball-bearings are employed in the rear axle and transmission, and gears are made exceptionally large for this size of car in order to ensure length of service. Placed on the rear axle, it is claimed that less noise is heard from revolving and changing of gears than in any other position.

In crowded traffic the Darracq cabs are exceedingly handy; the frame is narrowed forward to allow a wide steering angle, the turning radius being about 22 feet. Control is by means of throttle on the steering wheel and by a foot accelerator. Nothing is carried on the dash but the sight-feed lubricator. Gears are operated by a side lever, with a gate-type quadrant.

A landaulet body, constructed in Paris by the Carrosserie Industrielle, has been adopted, it allowing the vehicle to be either open or closed at pleasure. The taximeter, also of French construction, is carried on the left-hand side of the driver, where it is visible to both chauffeur and passengers. Instead of carrying spare tires, each machine will be equipped with a Stepney spare wheel, a British invention recently introduced to the United States. Gaulois tires are used on the cabs already arrived in New York, but it is declared that the Goodrich will be employed exclusively on the later vehicles. A school will shortly be opened to train the 500 drivers already enrolled on the company's books.

Darracq engineers recognized that an automobile for rough cab work must be built on entirely different lines from the pleasure vehicle; thus their existing models were put to one side and new vehicles designed. Nearly eighteen months ago we saw the first cab in the hands of the testers; to-day the new factory adjoining the old works is in full operation, turning out 3,000 cabs the first year, and having a contract for 2,000 chassis annually for ten years with one large syndicate.

The four-cylinder motor in one casting has cylinders 85 by 100 bore and stroke, horsepower rating being given as 14-16. Valves, mechanically operated, are all on one side, and ignition is by high-tension Simms-Bosch magneto. A winged tube radiator-forming tank is used, with belt-driven fan and gear-driven centrifugal pump.

Combined with robustness, interchangeability and accessibility have been sought in the new cab. If the motor needs attention, it can be dismantled in a few minutes merely by removing four bolts.

In the same way the removal of four

VIEW OF CHASSIS.

## FORECAST OF 1908 FRENCH MODELS

By GEORGES DUPUY.

PARIS, Sept. 2.—Interesting changes are being effected on the 1908 chassis, to be exhibited at the Grand Palais on November 12. There is a general tendency towards the chain, the cardan shaft having lost many of its admirers. In fact, it has been generally demonstrated on our European roads that the "non-suspended weight," the straining upon the differential gears (whenever there is a difference of level between the two traction wheels), the instability of the rear part of the car at high speed, and, above all, the wear upon the tires, are strong factors against the popularity of the shaft-drive. The small-town service chassis excepted—taximeters or light delivery vans—the European manufacturers will now equip almost all their models with the good old chain. A chain case of leather or aluminum will also be seen on every fashionable "voiture" in 1908.

Renault Freres have totally changed their transmission. Instead of the patented lateral switching of the gears which they have used successfully for the past four years—that is, the lateral displacement of the two gear shafts in the box—they are now building a double-sliding (triple with that of the reverse) like every common mortal. This will be just as silent as the old system, of course. They also do away with that big drop oiler on the dashboard. The drop-tubes alone are visible, while the oil tank is hidden under the bonnet. Lastly, their racer-like runabout—equipped with the ordinary 35-45 motor—seems to have conquered the favor of refined automobilists here, although I could name a few American runabouts much more comfortable.

The Panhard firm, old and venerable, has decided to wake up and do something. They have designed a motor with cylinders cast in pairs, fitted with a new Nilmelior magneto. They keep their armored wood frame, as in the past. De Dietrich will, next season, inaugurate the direct drive and a new tubular radiator.

Gobron has placed on the market a beautiful six-cylinder chassis of 60-100-horsepower, and a four-cylinder 15-horsepower for cab use, chain driven. The Gobron motor, as is well known, has a "double compensated" motion—that is to say, an explosion chamber at the top and at the bottom of each piston, so that the crankshaft works without any straining or deformation on its bearings, while the whole system gives the motor a perfect bal-

ance at all speeds. Bayard-Clément will exhibit a very interesting little 4-cylinder car, 14-20-horsepower, selling at \$1,300 complete, with four-seat double phaeton or the regular runabout body; Simms-Bosch magneto.

Simms-Bosch firm has just patented a new system of ignition, consisting of a magnetic ruptor fitted on the high-tension plug in the explosion chamber. This system suppresses entirely the high-tension distributor, as well as the ordinary low-tension ruptors, always so difficult to regulate. The camshaft, of course, acts directly on the new magnetic ruptors.

That transverse spring at the rear of the chassis, which is used on the Peerless in America, the Darracq, the Brouhot, the Pilain, the Delahaye and many others in France, and was abandoned by Renault last year, is likely to disappear, at least on the powerful cars. It gives a too considerable rocking motion to the heavy closed bodies, say the experts. C. G. V., Delahaye, Mors, Peugeot, Brasier, Delaunay-Belleville, Darracq, Mercedes, Hotchkiss, Leon Bollie, Fiat and other Italians will not add or modify anything of importance next year.

The "monobloc" motor—four cylinders in one casting—of which the C. G. V. firm is the pioneer, is gaining popularity. Almost all the "voiturette" builders are now adopting it on their chassis. This type is shorter, somewhat lighter, and gives a better cooling with less expense in the casting. The best "six" on the European market is now advertised by Napier, Bollée, Gobron, Itala, Fraignac, Mercedes, Hotchkiss, Brasier, Fiat and Darracq.

Multiple disc clutches have come to stay almost everywhere. They will be seen on a large number of chassis at the Salon. The old cone clutch has lived long enough. The Italians have adopted exclusively the Hele-Shaw pattern, with some times as many as twenty-six pairs of discs. Many French constructors are now placing the gasoline tank under the front seats, having realized the great difficulty of keeping a regular feed—on rough and uneven roads—with the actually prevailing system of exhaust pressure, hand pumps and "nurses." Finally, the detachable rim for touring purposes has not yet seen its best days here. A provision of "ready tires" constitutes a considerable weight to the load of the car, but seems likely to continue in vogue for some time yet.

### RECORD SPACE TOO SMALL FOR SALON.

PARIS, Sept. 2.—Entries for the decennial automobile salon, which will fling open its doors on November 12, were finally closed on August 15. The Paris municipality having generously given up a large portion of the Esplanade des Invalides for the erection of a huge temporary hall to supplement the Grand Palais. It was believed that for once every exhibitor could be allotted the maximum amount of space. Gustave Rives, the general manager, has to announce, however, that the cutting down process will again be indulged in, even the two big halls on the left and right banks of the River Seine being insufficient to accommodate all those asking for space. From a glance over the lists, American manufacturers do not appear to have been attracted by the decennial celebration. The few firms having agencies in France—they are still only a few—will be present as usual. Some lamp manufacturers and makers of accessories will exhibit, either directly or through agents. The only American display of any note, however, will be in the machinery section, where various types of machine tools will be shown in motion. Nearly a dozen leading American machine tool manufacturers have agents in Europe, who will show side by side with French and German houses.

During the Salon a competition will be held in the machinery hall for motor-driven electricity-producing plants, using low-grade coal gas. Silver and bronze medals are offered for competition by the *Poids Lourds*, in addition to numerous prizes offered by the executive committee.

### BREAKDOWN COMPETITION FOR CHAUFFEURS.

PARIS, Sept. 2.—Automobile mechanics are naturally men of resource, never non-plussed by breakdowns or refusals of the motor to perform the duties for which it was called into the world. At a smoker or any social gathering their skill in diagnosing and remedying the ills of the gasoline inspiring machine has been known to develop in a fantastic manner. To know what a mechanic can do under mundane conditions, when a silent, stubborn, responseless automobile is at his feet, a Parisian automobile journal has proposed a breakdown competition.

At one of the big automobile factories encircling Paris or on the quiet road around Longchamps race-course, where cyclists develop their form, the candidates for the expert mechanic diploma will be lined up in front of a row of machines, each one of which has the same secret malady. On the word of command each expert will rush to the machine reserved for him and endeavor to get it going in the shortest possible time. In one series the magnetos will be tampered with; in another clutches will need tender care; in a third the carbureters will have been specially disarranged; a fourth heat will test the ability of the men to change a number of burst tires. Thus tests will succeed one another until only the best men are left to compete in the finals. One dollar per head will be charged as entrance fee, in order to keep out the joyous individuals more anxious to obtain a half-day vacation from their employers than to compete in a competition. An official diploma will award the most skilled automobilists.

**FEATURES OF NEW MIDGLEY RIM.**

Attempts to solve the problem of providing a quicker and easier method of changing tires than the one in general use have not been lacking, though they have rarely met with considerable

success, during the past few years. A new production of more than ordinary interest has been designed by Thomas Midgley, inventor of the Midgley universal rim, the Midgley tread and other automobile accessories, and has been placed on the market by the Hartford Rubber Works Company, of Hartford, Conn.

The accompanying illustrations show the nature of the rim, which, it is declared, is truly universal, and can be used for any standard

**BEAD LOCKED IN POSITION.**

tire, either clincher or Dunlop. Previous attempts to produce a detachable bead have only been available for one type of tire. The new rim will supersede the Midgley universal rim, a former invention of Mr. Midgley and now widely used on automobiles. The turnbuckle feature, which has been a success on the former Midgley universal rim, is retained in the latest production.

As shown by the pictures there is only one bead and one turnbuckle. When the rim is used for the Dunlop tire a strip of rubber, as shown in illustration, exactly fitting the clincher groove, is put in on the inner side and the bead is reversed. By taking out the band of rubber and

**BAND FOR DUNLOP TIRES.**

by reversing the bead the rim takes any style of clincher tire. Lightness has been obtained on the new rim with sufficient strength to give every guarantee of safety. The rim can be used

with or without lugs. The three illustrations depict the rim complete, with the detachable rim secured in position; in the second one the band of rubber allowing the rim to be used for a Dunlop tire is seen; and in the last cut the two parts are shown side by side. To put on a tire by this device calls for the minimum of labor; the shoe and air chamber are slipped over the smooth edge of the rim, the bead put on and secured by means of the turnbuckle.

**THE TWO COMPONENT PARTS.**

**STANLEY GASOLINE RUNABOUT FROM MOORLAND, IND.**

**A NEW CAR FROM THE CENTRAL WEST.**

Indiana is maintaining its reputation for the production of popular-priced cars, the latest to make its bow being the Stanley gasoline runabout, made by the Stanley Automobile Manufacturing Company, at Mooreland, Ind. The newcomer is designed as a general utility car at a low price, and combines many features of merit. While its makers have taken advantage of the simplicity of the horizontal opposed two-cylinder engine, they have shorn it of some of its ordinary shortcomings by placing it forward under the hood, though still retaining the longitudinal position with regard to the chassis. The cylinders measure 5 by 5½ inches bore and stroke respectively, and the motor is rated at 20-horsepower. All the valves are mechanically operated and the motor is water-cooled, the car as a whole giving no inkling of the unusual position of the motor, as will be evident from the photograph illustrating it complete. A force-feed oiler is employed for the lubrication, while the carburetor is of a standard type and the ignition is of the high-tension order, current being supplied by dry cells. This placing of the motor has been taken advantage of to render every one of its parts not alone easily accessible, but also removable from the chassis without the necessity of dismounting the motor itself from the latter.

The frame is of the standard channel-section pressed steel, measuring ¼x2x3 inches, and is supported on four-leaf full elliptic springs all round, measuring 36x1½ inches, the latter in turn being carried on 34-inch wheels, which are shod with solid tires of the same size. The wheelbase is 108 inches and the tread standard, while the weight all on is 1,410 pounds. The front axle is a single piece of 1¼-inch steel, while the rear axle consists of crucible steel castings and seamless tubing as a housing, the driving shaft being 2¼ inches in diameter. A planetary type of transmission is employed, giving two speeds forward and reverse, with a single chain-drive to the rear axle. Roller bearings are used throughout. The Stanley runabout complete lists at \$900.

**POWER PLANT OF THE 20-HORSEPOWER STANLEY CAR.**

SPRAGUE ELECTRIC DYNAMOMETER WITH ENGINE COUPLED.

### ELECTRIC DYNAMOMETERS FOR ENGINE TESTS.

The handling of an electric current offers such a convenient and accurate method of determining the power output of a motor on test, that the use of a generator and resistance for testing preparatory to installing the motors in the chassis has become very general with automobile manufacturers. As a rule, most of the apparatus employed has been of home manufacture and more or less crude, usually consisting of a direct-current generator and bank of lamps or a water rheostat to dispose of the current. To obtain more accurate results, electric dynamometers have begun to take the place of these outfits, and specially designed apparatus of this kind is now being placed on the market by the Sprague Electric Company, New York City. They consist of a specially constructed direct-current generator, with compensating poles, mounted on a bed adapted to carry the motor to be tested, the general arrangement of the apparatus being shown by the accompanying illustration. The field frame of the generator consists of a cylindrical magnet yoke, to the inner side of which the poles are bolted, each pole supporting a field coil. Brackets containing the bearings are bolted to the end of the yoke, the front bracket carrying the rocker arm. Special bosses are cast on the end brackets to receive ball-bearings, which support the entire generator in such a manner as to permit of the oscillation of the field frame concentric with the armature. The movement of the latter is limited by a stud on the outside of the yoke projecting through a slot in a forging secured to the side of the supporting frame. The length of the slot, therefore, determines the arc through which the field frame can move. A short and a long arm extend horizontally from opposite sides of the field frame, to which they are rigidly secured, the short arm carrying at its outer end a small box to receive the amount of lead necessary to counter-balance the field frame on its ball-bearings, while the long arm is provided with a hanger for slotted weights, similar to those employed on an ordinary platform scale.

The motor to be tested having been mounted on the bed and attached to the dynamometer through the flexible coupling, its output is measured by means of the torque exerted by the generator armature in its tendency to rotate the field in the same direction as it is turning. By means of the weights on the hanger already mentioned, the amount of this torque can be readily measured. The horsepower of the engine can then be determined by the aid of the following formula:

$$HP = \frac{W + 2D + 3.1416 + S}{33,000}$$

in which  $W$  = weight in pounds on the end of the hanger;  $D$  = distance in feet from center of armature to weight, and  $S$  = speed of the engine in revolutions per minute during the test. It will be noted that in this formula the only variables with a

given dynamometer are the weight  $W$  and the speed  $S$ , so that with the aid of a curve or tabulation showing the horsepower developed at different speeds, an ordinary mechanic can perform the tests without making any calculations.

### BENJAMIN BRISCOE ON TRADE CONDITIONS.

"Recent events have caused some discussion as to the destiny of the automobile business," says Benjamin Briscoe, chairman of the committee of management of the A. M. C. M. A. "The tenor of this discussion has been, of course, influenced by the failure of two or three large concerns. These failures, in my estimation, mean nothing particularly as referring to the business as a whole.

"Last winter, in an interview, I said that I believed certain concerns were bound to fail and I decried the entry of so many new concerns into the field, which had little capital and less experience.

"As to the failures that have taken place, one can put his finger on the exact cause, and it is certainly not occasioned by a lessening general demand. It is true that there have been several contributory causes such as the lateness of the season, caused by the cold weather during the spring, even up to June, the general tightness of the money market, but these are not the real causes, it seems to me, though they may have quickened the end.

"One great cause why some concerns seem to lack business is their misinterpreting the demand. To succeed, certain definite policies must be adopted and rigidly adhered to. The everlasting changing of models; the giving of options so that every car made is different from every other car that preceded it; the starting out with a popular priced car and equipping it with accessories that made it necessary to advance the price beyond its class, the putting on of unnecessary and expensive additions, as it were."

### HOW AN OLD TIMER GIVES CONSTANT SERVICE.

The general presumption is that automobile engines require constant manual attention in the way of speed regulation and general control, particularly when working under varying loads, but the one here shown, which is used as a power unit for a concrete-mixing machine, seems to refute that theory effectively. The motor is one of the first of the single-cylinder Ramblers, and is fitted with the regular equipment standard at the time of its construction five years ago, both as to carbureter, lubricating and igniting systems. It is provided with an automatic spark controller, and it is said that with the throttle locked in position runs for hours under the varying loads to which it is subjected, without appreciable change of speed. While the power demanded is not excessive, when it is considered that the engine is exposed to all kinds of weather, and generally half covered with sand, mud and oil, it will be seen that the service exacted is of a decidedly strenuous nature.

HOW THE OLD RAMBLER ENGINE TURNS THE CONCRETE MIXER.

VILLE DE PARIS BEGINNING WORK AGAIN AFTER ITS ACCIDENT.

PARIS, Sept. 2.—In a boat-building yard in the eastern suburbs of Paris an aeroplane of much more than ordinary importance has been discovered under construction. Some time ago Captain Ferber, one of the leading authorities on aerial navigation, obtained a three years' leave of absence from the army to devote himself entirely to his favorite studies. In answer to all inquiries, the Captain replied that he was considering a new aeroplane, but had made little progress. Levavasseur, the maker of light-weight aeroplane motors, who was supposed to be in league with Captain Ferber, guarded off all inquiries in a similar manner.

Considerable progress, however, had been made with the new machine, work now being in such an advanced condition that flights may be expected this year. A 13-foot model, propelled by mechanical means, has made a series of flights, varying from 100 to 130 yards, with a wonderful display of stability.

The Antoinette-Ferber aeroplane has few points of resemblance with the existing successful machines. Its main members are a long keel and a couple of lateral wings. Two rudders are carried in front, and driving power is obtained from a 100-horsepower Antoinette motor, operating a propeller 94 inches in diameter. The illustrations of the aeroplane under construction in the Lein workshop show originality in methods of building. After repeated experiments with skeletons of birds, an improved form of wing has been designed with a cylindrical surface, declared to be 50 per cent. more effective than plane bearing surfaces. There are no metal or rope stays, so common on all aeroplanes up to the present, the new machine being as clean cut as a bird. Ash is employed for the wings, joints being formed by

aluminum sleeves and stays riveted with copper. Fully equipped with its 100-horsepower motor, its propeller and its pilot—who will be Captain Ferber himself—the aeroplane will weigh not more than 1,100 pounds. The 100-horsepower 16-cylinder motor, similar to the one used by Santos-Dumont, weighs exactly 100 kilos (220 pounds), or one kilogramme per horsepower. In 1902, when Levavasseur built his first aeroplane motor, the weight was two kilogrammes per horsepower. First experimental flights with the new machine will be made on the military drill-ground at Issy, near Paris.

After several months absence for repairs, as the result of a collision with her shed, the *Ville de Paris*, steerable balloon, has once more come forth. Its appearance coincides with the temporary retirement of the *Patrie*, called in for lengthening and strengthening of the frame with a view to carrying a heavier load. The first run undertaken to familiarize the crew with the working of the balloon was a complete success. Starting from Sartrouville,

the balloon made for the railroad station, then headed back for Maisons-Laffitte, touched Montesson and worked back to the starting point, answering its helm in a very satisfactory manner and proving thoroughly stable. On board were the owner, M. Henry Deutsch de la Meurthe, the designers, Surcouf and Kapferer, and a couple of engineers.

The *Ville de Paris* is 203 feet in length, 34 feet greatest diameter, and has at its rear eight cylindrical compensating tubes inflated with hydrogen, placed in pairs above, below and at each side of the rear portion. Its power plant consists of a 70-horsepower Argus motor, driving a propeller designed by the late Colonel Renard. There are two pairs of rudders, one of which is for altitude, the other for lateral movements. Inflexible military service has called M. Surcouf to the colors for several weeks, thus postponing further experiments. Immediately on his return, the balloon will recommence its daily tests.

### TROPHY FOR AEROPLANE COMPETITION.

A trophy which should have considerable influence in developing the growing interest in aeronautics has been offered by the *Scientific American* for competition for heavier-than-air flying machines. In order that the competition might be held under the auspices of experts, the trophy has been given under a deed of gift to the Aero Club of America, to be competed for annually by both American and foreign inventors. The first competition will occur at the Jamestown Exposition, September 14, 1907, and will be for a flight of one kilometer (3,280 feet) in a straight

HOW THE LEVAVASSEUR-FERBER AEROPLANE IS BEING BUILT ON ORIGINAL LINES IN A FRENCH WORKSHOP

line. The rules for the competition have been drawn up by a committee of the Aero Club. The competition is to be progressive in character—that is to say, if the flight of the predetermined distance is accomplished this year, next year a longer flight will be required. In other words, the conditions of the yearly contests will be such that they will be just ahead of the art, in order to induce inventors continually to strive to improve and perfect their machines. After every competition the name of the winner will be

inscribed on the trophy. If it is won three times in different years by any competitor, the trophy will become his personal property.

This splendid example of the silversmith's art which is intended to foster a great invention—a machine that shall conquer the air—is of great beauty. From a handsome green onyx base with a silver cartouche rises the massive sterling silver trophy, measuring 32 inches over all. At the base are six winged horses of cast silver, at right and left in groups of threes, with a rider astride each middle horse raising aloft the palm of victory. With this concession to mythology (for Pegasus, the horse of the muses, has always been at the service of the poets), we again ascend through the swirling air until we come upon the globe. Here, projected away from the earth, we find an aero-

SCIENTIFIC AMERICAN FLYING MACHINE TROPHY.

plane plunging through the ethereal envelope. The machine is in high relief, standing away from the silver globe with its frame held together by silver guy ropes. Above, surmounting the globe, is the eagle—the American Eagle—holding the wreath of victory, an eloquent forecast of the success of an American inventor. The trophy is valued at \$2,500 and its beauty at once brings to the lips the words: "Blue Ribbon of the Air." The contest will be watched with great interest.

### LOOKING FOR A COURSE FOR GRAND PRIX.

The Automobile Club of France is in the market for a first-class racing circuit on which to hold the 1908 Grand Prix, and has sent broadcast a request for applications. Essential qualities are a length of not more than 62 miles, no railroad crossing, no large villages immediately on the course, but some large towns capable of serving as headquarters must be within easy reach. A course of 50 miles round would be preferred to one of 62 miles, but as the new regulations are likely to bring forth a large number of contestants, safety calls for the increased distance. Naturally, the Dieppe authorities will put in a plea for the continuance of the favor bestowed upon them this year—to be selected as the scene of the French international automobile race is the greatest honor a provincial municipal council has yet conceived—but it will not receive preferential treatment. It is a foregone conclusion that the district selected will be asked to hand over a few thousand francs to meet expenses, but there is not likely to be any difficulty, even in the sparsely populated districts, in raising the amount. Dieppe is suggested as a permanent course by many automobilists, who would prefer greater economy in the organization, and believe that by reason of its nearness to Paris this circuit would be an excellent ground for all kinds of competitions.

## THE AUTOMOBILE CALENDAR.

### AMERICAN.

#### Shows and Meetings.

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.
- Nov. 2-9.....—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.
- Nov. 29-Dec. 6.—Chicago, Casino Garden, Second Annual Auto Parts Show. A. M. Andrews, secretary, 184 La Salle street.
- Nov. 30-Dec. 7.—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 14-21.....—St. Louis, Mo., New Coliseum, Second Annual Auto Show, St. Louis Automobile Manufacturers' and Dealers' Association.
- Dec. 28-Jan. 4.—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.
- Feb. 20-Mar. 7.—New York City, Madison Square Garden, Fourteenth Annual Motor Boat and Sportsmen's Show.
- April 6-11.....—Buffalo, Convention Hall, Motor Boat and Sportsman's Show. D. H. Lewis, manager.

#### Races, Hill-Climbs, Etc.

- Sept. 14.....—Boston, Readville Track, Race Meet Bay State Automobile Association (postponed from September 2).
- Sept. 14.....—Philadelphia, Point Breeze Track, Quaker City Motor Club.
- Sept. 14.....—Jamestown (Va.) Exposition, Aeroplane Contest for "Scientific American" prize.
- Sept. 14.....—Albany, N. Y., 95-mile Road Race, under the auspices of the Albany Automobile Club.
- Sept. 21.....—St. Louis, First Annual Owners' Reliability Tour, Automobile Club of St. Louis.
- Sept. 20-21.....—Milwaukee, Wis., State Fair Grounds Track, 24-hour Race, Milwaukee Automobile Club and Milwaukee Dealers' Association.
- Sept. 21.....—Harrisburg, Pa., Middletown Track, Race Meet, Motor Club of Harrisburg.
- Sept. 22-24.....—Newark, N. J., Olympic Park Track, Essex County Fair Automobile Races.
- Sept. 24-25.....—Springfield, Mass., Good Roads and Legislative Convention, under auspices of Springfield Automobile Club.
- Sept. 30-Oct. 5.—Trenton, N. J., Inter-State Fair Automobile Races, Includes 24-hour Event.
- Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

### FOREIGN.

#### Shows.

- Aug. 1-Sept. 30.—Holland, Amsterdam, International Exhibition of Motors and Machines, Palace of Industry.
- Sept. 28-Oct. 7.—Denmark, Copenhagen International Auto Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1.—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.
- Dec. 5-22.....—Berlin, Germany, Automobile Show.
- Jan. 18-Feb. 2.—Turin, Italy, Fifth International Automobile Exhibition, Palace of Fine Arts, Valentino Park, Automobile Club of Turin.

#### Races, Hill-Climbs, Etc.

- Sept. 15.....—Austria, Semmering Hill Climb, Austrian Automobile Club.
- Sept. 15.....—France, Chateau-Thierry Hill Climb.
- Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.
- Oct. 20.....—France, Gallon Hill Climb.
- Nov. 1-15.....—France, Volturette Contest near Paris.
- May 16, 1908....—Sicily, Targa Florio, Automobile Club of Italy.
- June 20-July 5, 1908.—Grand Prix, Dieppe Circuit, Automobile Club of France. (Exact date to be announced.)
- July 14, 1908....—Paris to London, Aerial Race.

## EARLY FALL HAPPENINGS AMONG THE CLUBS

### SPLENDID AUTO PARADE IN THE BISON CITY.

BUFFALO, N. Y., Sept. 9.—No spectacle of Buffalo's Old Home Week excelled the automobile parade which was held the evening of Tuesday, September 3. Never before have the people of this city witnessed such a pageant of horseless vehicles. In point of beauty of illumination, harmony of color and extravagance of

E. R. THOMAS'S THOMAS FLYER THAT WON THE FIRST PRIZE.

decorative art, the automobile parade had everything beaten. It must have cost a lot of money to decorate some of the cars in that parade, and the owners spared nothing in their endeavor to capture the eyes of the three judges who awarded the prizes.

The competing cars lined up on the west side of Main street in front of the automobile club's rooms, and about eight o'clock pots of red fire announced the start of the procession, which slowly proceeded down Main street to the Terrace and countermarched to Luna Park, where the judging took place. As the cars entered the park they backed up in double rows, facing the packed grandstand. The judges, Wilfred P. Davidson, John D. Wells, and A. M. Sterling had to dive in and out of a moving throng in order to get a good scrutiny of the decorations. They had twenty-five prizes to award.

Secretary D. H. Lewis worked indefatigably for the success of the event. President W. H. Hotchkiss of the A. A. A. was a participant in the parade, but did not enter for the prize competition.

The E. R. Thomas heavy touring car was lavishly decorated, a huge centerpiece representing the American eagle on the wing and typifying the Thomas Flyer. Jesse B. Eccleston's Peerless was bedecked in silk, with numerous white doves holding ribbons in their bills. F. A. Babcock's electric touring car, second prize in its class, was trimmed in white, with countless electric bulbs of miniature size. The judges announced the following as prize winners:

Heavy Touring Cars—First, E. R. Thomas, Thomas Flyer; second, Jesse B. Eccleston, Peerless; third, Chauncey J. Hamlin; fourth, Mrs. John L. Clawson; fifth, Eugene Kulp; sixth, James L. Byers; seventh, F. B. Wells.

Light Touring Cars—First, Charles Schoenhut; second, F. A. Babcock, Babcock electric; third, J. L. Gress; fourth, D. H. Lewis; fifth, J. H. McNulty; sixth, G. H. Poppenberg, Rambler; seventh, W. O. Holmes; eighth, W. G. Ruddle; ninth, George F. Beck; tenth, Empire State Tire Company; eleventh, Seymour P. White.

Heavy Runabouts—First, Albert Poppenburg; second, Louis Block, Ford; third, Ralph Sidway.

Light Runabouts—First, Otto Hagelin; second, William Orell; third, Deschaum Automobile Company.

Special Prize—Captain J. B. Souter.

### MONTANA'S FIRST AUTO CLUB FLOURISHES.

BUTTE CITY, MONT., Sept. 7.—Though but very recently organized, the Butte Automobile Association is already becoming extremely active and there is every prospect that within a short time it will constitute a body such as few cities of a similar size can boast of. Bruce Kreamer has been appointed attorney and the club will be duly incorporated under the laws of Montana. Until such time as the charter membership roll shall be closed, the initiation for members is to remain at \$5 and that for associate members at \$2.50, and the club has immediately made itself strong with all the powers that be by electing the mayor, members of the board of aldermen, the county commissioners and the newspaper men all associate members. The club now has 75 members and it is anticipated that this will be increased to 300 or more within the next 30 days, when the charter roll is to be closed.

The club will actively interest itself in everything calculated to advance the interests of automobiling and as a first step Messrs. Gillie, Carroll, Berkin and Rinckel were appointed a legislative committee, while as the result of a communication from the Chicago Automobile Club, requesting particulars of a route to Butte, President H. E. Harris suggested the appointment of a route bureau. The idea was acted upon favorably and a committee consisting of Walter Beck, Arthur Pierce, Creighton Leargey and Dr. Rinckel was appointed. The meeting was held in the rooms of the Stock Exchange and they will continue to be club headquarters until the organization has grown sufficiently to erect its own building.

### AURORA CLUB TO HOLD AUTO CARNIVAL.

AURORA, ILL., Sept. 9.—The Aurora Automobile Club has decided to treat the inhabitants of this part of the State of Illinois to an automobile carnival, the like of which they have never seen before. It is scheduled for September 28 and plans are under way to make the celebration as complete as can possibly be done, every member of the special committee appointed at the meeting held last week having been allotted a special part of the work to be superintend. So far as at present outlined, the affair is to be opened with an extended series of gymkhana events, for which

G. H. POPPENBERG'S RAMBLER, ALSO A BUFFALO WINNER.

numerous novel features hitherto untried are promised. There will also be speed races, and it is intended to have one of the well-known racing cracks in attendance as the drawing card of this part of the program. The members of the special committee appointed at the last meeting are: W. A. Legcrman, D. W. Simpson, C. C. Hinckley, C. B. Phillips, Dr. E. J. Sill, R. H.

Colby, M. E. Woolf, W. F. Thorne, Frank Anderson, S. E. Miller, Otto Hammerlund, F. D. DeVier, J. J. Warne and E. A. Miley. Prizes will be offered in all events and as an inducement to outside autoists all those purchasing tickets to the value of \$2.50 or more will be entitled to a club membership until the first of the coming year.

#### MOTOR-BOAT CARNIVAL ON THE HUDSON.

NEW YORK, N. Y., Sept. 10.—Beginning September 23 the race week of the Motor Boat Club of America, in which is included the National Motor Boat Carnival, will be held on the Hudson river, New York, and the program outlined promises a very interesting series of events. In order to make the interest more general a distinction has been made between purely racing craft and utility types, and there will be events for various classes from dinghys up. The events are open to all members of regularly organized yacht or motor boat clubs in this country or abroad, the races being governed by the rules of the Motor Boat Club of America.

The program of events for the week is as follows: Monday, September 23: Reliability trials. Tuesday morning, September 24: Mile speed trials against all existing world's records; afternoon, free for all race, also races for motor dinghys up. This is generally looked upon as ladies' day. Wednesday, September 25, Thursday, September 26, and Friday, September 27: Series races, all classes, in which are included the perpetual challenge trophies for the championships, as follows: International, national, interstate, motor yacht and cabin cruisers. Saturday morning, September 28: Long distance race, New York to Albany and return; afternoon, long distance from New York to Poughkeepsie and return. The former is intended for the larger type of high-speed boats, and the Poughkeepsie race more for the cruising type of boats.

#### OHIO VALLEY AUTO CLUB BANQUETS.

WHEELING, W. VA., Sept. 9.—The Ohio Valley Automobile Club, which has its headquarters in this city, is proving to be a most successful organization and is doing a great deal for the welfare of autoists and automobiling, besides having a good time of it in the process. Following closely upon its successful run to Coleraine, O., of a few weeks ago, the club gave a dinner at the Stone House, Roney's Point, W. Va., last Thursday evening, which under the able management of Secretary T. A. Westmyer proved a most enjoyable affair. The club has been very active in prosecuting its good roads campaign and is also taking considerable interest in road marking, besides which folders are issued giving the routes to important points from Wheeling, one of the latest to appear being that to Columbus, O., via Fairview, Zanesville, Jacksontown and Reynoldsburg over the old national pike. It also contains an injunction that is of value to every autoist passing that way: "Don't forget to register at the first toll-gate in Guernsey county, which is the last toll-gate on the pike, as otherwise double rates are charged."

#### VIRGINIA AUTOISTS FORM STATE ASSOCIATION.

RICHMOND, VA., Sept. 9.—In order to become eligible to membership in the American Automobile Association, as a State body, the Richmond Automobile Club has been succeeded by the Virginia Automobile Association, which has a charter membership of 45. The following officers were elected at a meeting held at the Richmond Hotel last week. President, Dr. R. Angus Nichols; vice-president, John B. Swartout; secretary and treasurer, Otis M. Alfriend. The president appointed committees to draft a constitution and by-laws as well as to carry out other necessary work to perfect the organization.

The purpose of the latter is to advance the interests of autoists generally and to endeavor to defeat proposed hostile legislation, as well as to effect the repeal of that now in force. It is ex-

pected that the 100 members necessary to complete the State organization will be enrolled within the next fortnight, as auto enthusiasm is increasing daily throughout the Old Dominion.

#### OQUAGA CUP TOUR STARTS SEPTEMBER 16.

BINGHAMTON, N. Y., Sept. 9.—Dates have been set for the Oquaga Cup tour for 1907, and start will be made from this city, September 16. Members of the Binghamton Automobile Club only are eligible to compete for the trophy, and entries will close September 14. The first leg of the tour is from Binghamton to Richfield Springs, N. Y., a distance of 98 miles, where the first night stop will be made. The second day's run will be 84 miles, from Richfield Springs to Syracuse, and the third day from Syracuse to Ithaca, a distance of about 130 miles. The final and fourth day's run will be from Ithaca to Binghamton, 56 miles. The Oquaga cup was the joint gift of W. G. Faatz and F. E. Barnes to the club, and was won last year by Ross M. Russell, who has donated it to the club to be contested for again.

#### BIG ENTRY FOR PHILADELPHIA'S 24-HOUR.

PHILADELPHIA, Sept. 9.—Next Saturday's meet of the Quaker City Motor Club will in all likelihood far outclass in importance all previous efforts of that hustling organization. The 100-mile event, the Keystone State championship, will see fully a dozen cars lined up, including two Frayer-Millers, Packard, Welch, Peerless, Oldsmobile, Stearns, Pullman, Pennsylvania and Thomas, with several possibilities to be heard from. The two 25-mile events—one for touring cars, the other for runabouts—also have filled well, and good weather is all that is needed to bring a record crowd to Point Breeze next Saturday.

#### FREEPORT, ILL., ORGANIZES AN AUTO CLUB.

FREEPORT, ILL., Sept. 9.—Organization of the Freeport Automobile Club has been effected here with a goodly number of local autoists as charter members. One of the features projected by the new organization is a race meet on the local track the latter part of September, the date for which will be made public in a few days.

#### SOME AUTO NEWS FROM GERMANY.

BERLIN, Sept. 1.—The two German officers, Graetz and von Roeder, accompanied by a chauffeur, started August 10 on their African tour from Dar-es-Salem to Swakopmund. They sent off a telegram to the King of the Belgians at their start, greeting him as the chief bearer of culture in Africa. This has caused some comment, as the Belgian rule in Africa can hardly be called a happy one.

The commercial car trials arranged for the autumn will be held during a period of six days from October 7 to 12 on the Berlin Magdeburg-Dessau-Jueterbog route. The entries closed on September 1, and are already numerous enough to insure the success of the contest.

It is pretty well assured that the German Autodrome will be laid out in the Eifel, as in spite of assertions to the contrary there is a very strong opposing body in Taunus. Several meetings have taken place at Aix-la-Chapelle, which would then be made the starting point.

His Majesty, the German Emperor, has bestowed the Order of the Prussian Crown, third class, upon Count Sierstorff and Dr. Levin-Stoelting; of the fourth class upon Herr Engler, and the Order of the Red Eagle, fourth class, on Count Arco, Baron von Schrenck-Notzing, and Herr De La Croix, for their services in regard to motoring.

Neither Baron von Hewaldt nor Captain Hildebrandt intend going to St. Louis as Germany's representatives for the Aero Gordon-Bennett in October, according to present information.

## MASSACHUSETTS RE-REGISTRATION SHOWS 9,257 AUTOS

BOSTON, Sept. 9.—Legislators and automobilists who expected to see every road in Massachusetts made into a fine macadamized and oiled highway with the proceeds of the automobile law passed this spring, assessing an annual fee of \$5 upon every owner of an automobile, were very much surprised when they learned the result of the re-registration of automobiles, which has been in progress under the direction of the Highway Commission for the past five weeks or more. The most conservative estimated that the re-registration would yield at least \$75,000 for road work, and there were plenty who expected that as much as \$100,000 revenue might result. Even the Highway Commission prepared to re-register as many as 15,000 cars.

As a matter of fact, the re-registration, which is now practically completed, shows that there are now less than 10,000 cars in use in Massachusetts. The exact figures are 8,207 automobiles re-registered and 1,050 new certificates issued, making a total of 9,257 cars in use at the present time. This number seems very small when it is compared with the more than 23,000 sets of number plates that have been given out in the last four years. In addition to the automobiles, the commission has re-registered 478 motor cycles and 186 dealers or manufacturers, and the total income from re-registration is \$44,781, which looks small indeed compared with the estimates that were made last winter when the

law was under discussion at the State House. Added to this amount there is about \$5,250 from new registration, but the total amount is only about \$50,000, and the Highway Commission estimated that it would take that amount alone to make the necessary repairs of damage caused by automobilists to existing State roads. And the work of re-registration has cost over \$5,000.

The principal cause of the shrinkage is thought to be that owners of cars have failed to obey the law, which requires that upon the transfer of ownership of a car the party selling it shall notify the Commission and have the certificate of registration cancelled. Applications for re-registration indicate that much more of this has been going on than the Commission suspected. Another cause of shrinkage is that each summer many cars from outside States are registered in Massachusetts. These cars are now in their home States as a rule and will not be re-registered until next summer. Some autoists have put their cars in storage rather than pay \$5 now and another \$5 for registration in 1908 on January 1, while there is no doubt that there are owners who are taking chances of being arrested and are planning to run their cars the rest of the fall without re-registering them. Some clubs have advised their members not to re-register their cars, on the ground that the law is unconstitutional. This attitude is bound to bring about a test if it is persisted in through the fall months.

## A NEW JERSEY FINE AND A PENNSYLVANIA SENATOR

PHILADELPHIA, Sept. 9.—A fortnight ago, Justice of the Peace Carver, of Elwood, N. J., fined State Senator James P. McNichol, the political leader of this city, \$13.30 for fracturing the speed ordinance of the State, rousing the Senator's ire, to put it mildly. Had McNichol not been in a hurry to reach the shore, he would have refused then and there to "pony up." But the constables had him and his machine, and to get away he had to pay. When he reached Atlantic City he lost no time in calling up his lawyers and instructing them to appeal to the Supreme Court. The appeal was heard by Justice Frenchard in Camden last week, and the Senator won his point, securing an order for the remittance of the fine. True, the victory was on a technicality over the irregular manner in which the complaint was made, there being no decision that the law had not been violated.

But the end is not yet. Justice Carver has carried his case

to Motor Vehicle Commissioner Smith, and the latter, firmly believing from the testimony that McNichol and his chauffeur broke the laws, has ordered them to appear before him at Trenton next Friday to show cause why their licenses shall not be revoked. As New Jersey is the Senator's favorite stamping ground, and as those who know him say he will fight what he thinks an injustice to the last ditch, local automobilists are preparing for a hot legal battle at the Jersey capital. It has been the custom of the Motor Vehicle Department to revoke the licenses of those who fail to appear in answer to the Commissioner's summons, and if McNichol and his chauffeur do not show up next Friday their names will, in all probability, be stricken from the list of eligibles, and if afterward caught operating a car in Jersey they will be jailed.

Much interest is manifested in the outcome of the incident.

### ANENT IMMUNITY FOR MEDICAL AUTOISTS.

INDIANAPOLIS, IND., Sept. 9.—At its next meeting the City Council will be asked to pass an ordinance allowing local physicians and surgeons to break the automobile speed laws in answering emergency runs. Such an ordinance was suggested by Police Judge Thomas Whallon recently when he discharged Dr. Frank Dorsey, who had been arrested while making a fast run to see a patient who had been crushed by falling iron. For several days leading physicians have been drafting an ordinance that they believe will meet their needs.

The proposed ordinance has succeeded in raising a difference of opinion among physicians who drive automobiles. The majority are in favor of a measure that would assure them immunity from arrest when driving fast. Dr. T. A. Wagner, one of the oldest practitioners in the city, has taken a stand against it. He declares that in the thirty years he has practiced he could count all of the cases on the fingers of one hand where a few minutes saved would have saved the life of a patient. Dr. Wagner uses automobiles exclusively in his practice.

### ECONOMICAL POLICE SERVICE AUTO TRIAL.

INDIANAPOLIS, IND., Sept. 9.—Local police have just been given an extensive test with an automobile patrol wagon, at the request of the Board of Public Safety, which is contemplating the purchase of one or more such vehicles to add to the White steam touring car and the Autocar runabout now in service.

The demonstration was made last Saturday and Sunday by the Indianapolis Motor Car Company with a Rapid gasoline delivery wagon, temporarily equipped as a patrol wagon. A test covering forty-eight hours and making all but three calls that came in was made, doing the work, with the one slight exception of two horse-drawn patrol wagons and two relays of horses. Two of the three runs could have been made, as the automobile patrol returned to police headquarters as one of the horse-drawn wagons was leaving.

In the forty-eight hours' time, in fifty-one runs for prisoners, 185 miles was covered. This was accomplished with eighteen gallons of gasoline that cost \$2.04. An appropriation will be requested at once and bids will probably soon be asked for.

**What Finally Becomes of the Old Automobiles?** There is a popular impression, more or less prevalent, that the automobile is a machine of short duration and that it would be difficult to find many that date back to the early days of the industry. Anyone who wishes to disabuse himself of such a notion will not find it difficult to do so, particularly if he be located in one of the larger automobiling centers. He has but to respond to some of the alluring baits held out by a few of the many second-hand dealers, and, equipped with a knowledge of what cars were, and what they are to-day, compare the printed description and its subject, lined up awaiting a purchaser.

To the average autoist of to-day a car of the vintage of 1902 is a relic in about the same class as Fulton's first steamboat, and he would be amazed to find the number in existence, not alone of the year in question, but those preceding it. Like the maid who has left her prime behind, the second-hand man is fond of lopping off years and it does not trouble his conscience much to say 1904 when he should say 1901. It takes one well versed in the models of different years to be able to say with certainty the date of their origin, particularly where foreign cars are concerned, one dealer calmly offering a French car as of the year 1903 until the knowledge of the prospective purchaser forced him to admit that it dated back to 1900, though rebuilding had obliterated many of its early earmarks. American cars of former years are generally

easier to distinguish, but nevertheless it is little short of marvelous the number of them that are still far from the scrap heap. That so few of them are seen running in the cities would appear to indicate that their outlet is found in the rural districts. Yet, if a contest of old-timers, such as has been held on the other side, were to be run, the number that would come forth even in New York City would be little short of eye-opening.

**Steel as a Material for Piston Construction.**

In view of the fact that automobile manufacturers have halted at nothing to improve the quality of their product, materials of a nature so costly as to be absolutely prohibitive to the makers of other kinds of machinery being lavishly employed, the question has frequently risen as to the reason for the non-use of steel for pistons and cylinders. Sheet steel cylinders and pistons have been resorted to in the construction of at least one racing car built on this side of the Atlantic; but doubtless, owing chiefly to the difficulty of properly lubricating this metal in contact with itself, its employment has not been regarded seriously. To take up the matter of pistons alone, the very high speeds found necessary in automobile practice, due to the necessarily restricted size of the motor, make imperative the use of moving parts that shall be as light as possible. The use of steel for this purpose would appear to be the most direct means of achieving this end, beside which the material also has other advantages over the commonly used castiron piston which dates back to the time of the invention of the first prime-movers.

French makers have been concededly in advance of their competitors in other lands in the matter of research along such lines, so that it is not surprising that the use of pistons of pressed steel is now said to be gaining considerable favor with the more prominent automobile builders of that country, although one American maker under license will import these parts and embody them in his 1908 models. The fact is of more than ordinary importance in that it marks the first radical departure from methods of engine construction that have held their own so long as to be considered almost inalterable. The automobile has been responsible for countless hitherto undreamed of innovations, but none so far-reaching as this, so that its outcome will be watched with unusual interest.

**Present Status of the Self-starting Device.**

For one reason or another, interest in self-starting devices seems to have lapsed into a semi-dormant state during the past season, and at the present writing it appears questionable whether there will be any decided revival apparent in number of the devices exhibited for this purpose at the coming shows. It is generally conceded that ability to restart the motor from the seat, regardless of the length of time it has been standing idle, is a great advantage, but whether it is such to an extent that compensates for the extra complication involved is questionable. Not that there is any particular or insurmountable difficulty inherent in the problem of evolving such a device for automobile use, as there seems to be no reason why stationary practice in the use of compressed air cannot be modified to suit the altered conditions presented by the automobile.

Doubtless, the more general acceptance with which the six-cylinder motor has met, and the fact that there will be a great many more cars of this type turned out during the manufacturing season of 1908, may have had something to do with it. The modern four-cylinder motor has been developed to a point where, under normal conditions, there is considerably less use for the starting crank than formerly, and the six-cylinder motor greatly surpasses it in this respect. Both are self-starting to such an extent that the matter of installing an extraneous device to provide for the small percentage of instances in which they fail, merely to avoid a little work at the crank, is not destined to be generally regarded in a favorable light in the near future.

**BAY STATE AUTOISTS HOLD NOTABLE MEET.**

NEWCASTLE, N. H., Sept. 9.—The first general meeting and outing of the Massachusetts State Automobile Association of the American Automobile Association, held at the Hotel Wentworth in this town, broke up this afternoon, and the automobilists who were present as representatives of the various clubs throughout the State affiliated with the Massachusetts organization went away well pleased with the results of the gathering. About one hundred members of the State association and ladies arrived Friday evening and others came Saturday, so that there was a large attendance Sunday and to-day.

The principal feature of the meeting was the banquet Saturday evening, and the formal addresses delivered on that occasion and informal discussions later have given the automobilists a better understanding than they ever had before of what the State association aims to accomplish. Moreover, a general policy to be pursued during the coming winter before the Legislature was outlined. The speakers at the banquet included Elliot C. Lee of the Massachusetts Automobile Club, formerly president of the A. A. A.; President L. R. Speare, of the Bay State association; President J. H. MacAlman, of the Boston Automobile Dealers' Association; ex-Congressman Samuel L. Powers, a leading corporation lawyer of Boston; S. L. Haynes, of the Springfield Automobile Club; President Hill, of the Brockton Automobile Club; Representative A. D. Converse; Secretary James Fortescue, of the Bay State association, and others.

President Speare explained the national automobile registration bill which has been drafted by Chairman Terry of the A. A. A. Legislative Board. He stated that this bill, if it became a law, would enable an automobilist to tour wherever he wishes without being hindered by the different State laws.

Mr. Powers spoke in favor of the passage of a bill by the next Massachusetts Legislature making it obligatory for all vehicles using the roads at night to carry lights. He said that by united action on the part of the automobilists he thought the Legislature could be induced to pass the bill. It was the general sentiment of the automobilists present that such a bill would be of much value, not only to automobilists but to drivers of horses.

The other speakers touched upon these subjects and urged the automobilists to obey the laws and respect the rights of other persons who use the highways.

On Saturday there was a baseball game between a team representing the Bay State association and one made up of members of other clubs, and afterwards the automobilists united in a parade which was a part of the celebration of the anniversary of the signing of the peace treaty between Russia and Japan. The concluding feature of the meeting was a series of gymkhana games this afternoon for owners of cars, the prizes being offered by the management of the hotel.

**GENERAL MEETING OF A. A. A. DIRECTORS.**

A meeting of the board of directors of the American Automobile Association will be held Thursday morning, September 19, at 11 o'clock, at the association's offices, 437 Fifth avenue, New York City.

The national body's entire board, composed of representatives selected by the various State organizations, meets three times a year, the coming session being the second one for 1907. The acts of the executive committee come before this board for approval.

**WELLMAN'S POLE TRIP AGAIN POSTPONED.**

TROMSOE, Sept. 9.—According to Captain Isachen, in command of the Norwegian Arctic expedition which arrived here to-day from the North, Walter Wellman and his party will probably return here at the end of the present month, abandoning their plan to attempt to reach the pole in an airship for the present year. No start had been attempted up to August 26.

**THE DEMAND FOR AMERICAN AUTOS ABROAD.**

In response to the constantly increasing number of requests made by American manufacturers as to the conditions prevailing in foreign countries and the standing of the latter as markets for American-made automobiles, the Bureau of Manufactures of the Department of Commerce and Labor at Washington has just compiled the reports of consuls in all parts of the globe, covering the matter very comprehensively. These reports, the majority of which have been published in *THE AUTOMOBILE* from time to time as they appeared, cover every phase of the use of the automobile in the countries from which they emanate, the market for American machines, the manner in which the latter are regarded by the inhabitants, number of machines of all kinds in use, prevailing prices, demand for accessories and the like, as well as the best methods of obtaining business in such places. Furthermore, they generally go into detail regarding the types and characteristics of the cars most desired and the reasons therefor, so that the pamphlet, which is entitled *Motor Machines*, being Volume XL of the *Special Consular Reports*, should prove of considerable assistance to manufacturers desiring to increase their export business. Copies may be had on application to the Department of Commerce and Labor, besides which there is much special information on file at the Bureau of Manufactures.

**BRITISH COMMERCIAL VEHICLE TRIALS.**

LONDON, Sept. 2.—For the long deferred trials of the British Club a total of sixty-two entries has been obtained in the eight classes. Possibly the makers have become tired of waiting for this event, for the list is not as great as had been anticipated.

All the same, the event has been well boomed in the general press and will doubtless serve an important purpose in further popularizing the utility motor vehicle. The trial will consist of twenty-two days' closely-observed running, under full load conditions, and during the tour the vehicles will, at different times, be on exhibition at the important industrial centers. The proceedings commence on September 9. No American vehicle is included in the list.

**CHANGES IN N. A. A. M. EXECUTIVE COMMITTEE.**

Owing to the embarrassment of the Pope interests, Albert L. Pope tendered his resignation as president of the executive committee of the National Association of Automobile Manufacturers at its September meeting, held last week, together with that of George W. Bennett, who recently severed his connection with the Knox Automobile Company to take charge of the New York branch of the White Company. Mr. Bennett's resignation was accepted as a matter of course, and he was succeeded by M. L. Goss, of the Baker Motor Vehicle Company, but the members of the executive committee unanimously refused to accept Mr. Pope's resignation, instructing the secretary to wire Mr. Pope, demanding the withdrawal of his resignation. In view of this token of regard, Mr. Pope acceded to the wishes of his associates and will continue in office as if nothing had happened.

**WHY "THE AUTOMOBILE" WAS LATE.**

Readers of *THE AUTOMOBILE* undoubtedly were surprised at the tardiness of the September 5 issue in reaching them. A delay was caused in the New York Post Office, the entire edition being held up for forty-eight hours until a ruling could be obtained from Washington in reference to the Winton page advertisement, wherein prizes were offered to chauffeurs who obtained the best economical results from their Six-Teen-Sixes. The New York Post Office officials, questioning that the advertisement might violate the lottery provisions of the law, promptly submitted the case to Washington for a decision. The advertisement was ruled "unobjectionable," but few of *THE AUTOMOBILE* subscribers saw their copies until Monday morning.

## EXHIBITORS FOR THE A. C. A. PALACE SHOW

OWING to the tremendous demand for space at the eighth annual show of the Automobile Club of America, held in conjunction with the American Motor Car Manufacturers' Association and the Motor and Accessory Manufacturers, Inc., it has been decided to practically remodel the big exhibition hall of the Grand Central Palace, where the show will open on October 24 and continue until the following Thursday night, inclusive. Instead of dividing the exhibits on three floors, as formerly, there will be a main exhibition hall and two galleries. To do this, the café will be relegated to the second gallery and all the partitions which now separate the upper galleries from the main floor will be torn out. A ten-foot aisle will be cut through the first gallery to a central stairway, connecting with the upper gallery.

The elimination of the partitions will enable visitors to obtain a comprehensive view of almost the entire exhibition, either from

the main floor or the upper gallery. The latter will also house the Aero Club's exhibit and a theater.

With the changes, there has been made available a total floor space of 65,279 square feet, of which the members of the American Motor Car Manufacturers' Association will occupy the lion's share, or a total of 23,641 square feet; with 16,087 square feet for the use of the Motor and Accessory Manufacturers, the remainder being given over to commercial vehicles, motorcycles and spaces under the head of "General Allotments," which will be occupied by manufacturers not affiliated with either of the above organizations. In round numbers the latter aggregate 10,000 square feet of space on the main floor for the exhibition of cars and a like amount in the upper gallery for accessories.

Seventy makers of complete vehicles are included in the list of the exhibitors.

### BALTIMORE SHOW THANKSGIVING WEEK.

BALTIMORE, Sept. 10.—At a meeting held last night by the Automobile Dealers' Association, arrangements were made for the holding of an automobile show in this city on Thanksgiving week. While the dealers were unanimous in favor of holding the show, there was some little difficulty at first as to time and place. This will bring the show between the Licensed show in New York and the Chicago show. The association, assisted by the A. C. of Maryland, is now negotiating for a building.

### NEW HAVEN TO HAVE AN EARLY SHOW.

NEW HAVEN, CONN., Sept. 9.—When the New Haven Business Men's Association opens its third big exposition at the Second Regiment Armory, October 26, it is expected that there will be one of the most complete exhibits of automobiles on the floor ever seen in this city. All of the local dealers will be represented, and in connection with the show a number of special events are being planned which will interest not only dealers but owners of cars as well.

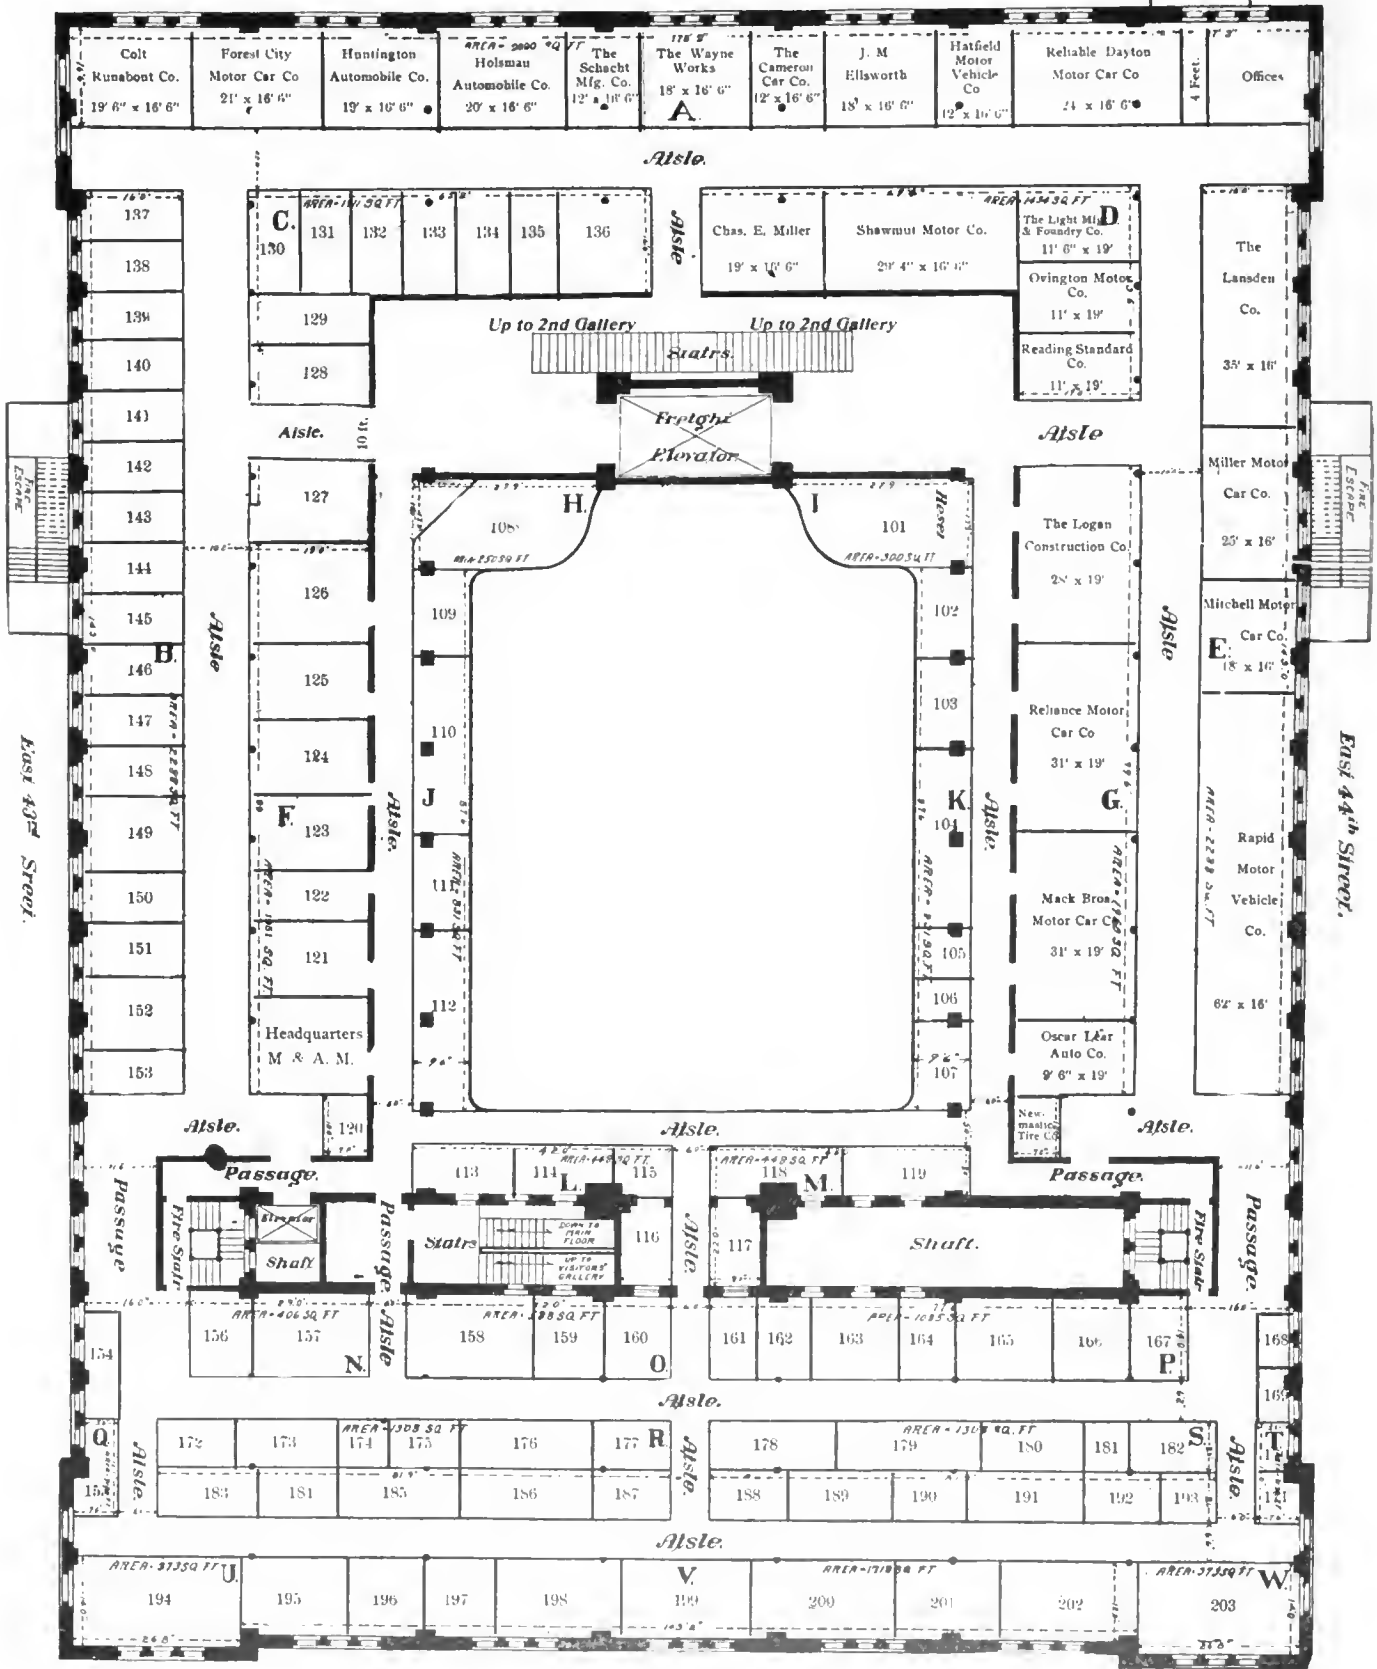

PLAN OF THE MAIN FLOOR OF THE GRAND CENTRAL PALACE, SHOWING LOCATIONS OF EXHIBITORS.

Press Room

WHERE THE EXHIBITORS WHO OCCUPY THE GALLERY OF THE GRAND CENTRAL PALACE WILL HOLD FORTH.

Depew Place

ACCESSORIES WILL BE SHOWN ON THE THIRD FLOOR AS OUTLINED IN THE ABOVE DIAGRAM.

**MATHEMATICS OF THE WILKESBARRE CLIMB.**

One of the prizes offered at this year's climb up "Giants' Despair" at Wilkesbarre, Pa., was the *News* gold medal, to be awarded to the car drawing the greatest weight per horsepower per second. More than half of the two-score participants in all classes decided in the hill-climb were entered in this contest, and the great amount of figuring necessary accounts for the delay in announcing the winners, and they have just been made public by the members of the Wilkesbarre Automobile Club, who acted as judges and referee. The results were calculated by weighing the cars and determining their horsepower according to the recently adopted formula of the A. L. A. M. This gives the weight per horsepower, the time element being computed from the records made on the hill by the various cars.

The committee was composed of P. A. Meixell, W. L. Raeder and B. R. Jones as judges, and D. C. Roberts as referee, all being members of the Wilkesbarre Automobile Club. The following

table reveals the standing of the first six cars according to this method of figuring:

Car	Driver	H.P. Pounds per Second
Matheson.....	Ross Anderson.....	5535
Flat.....	Kessler .....	4984
Matheson.....	Charles Ward.....	4118
Knox.....	Bourque .....	4063
Thomas Flyer.....	Montague Roberts.....	3649
Maxwell.....	Price .....	3268

**THE WINTON TRANSCONTINENTAL SHOW.**

General Sales Manager Charles B. Shanks, of the Winton Motor Carriage Co., yesterday arrived at the New York City branch of the Winton Company, Broadway and Seventieth street, where the "Model Six-Teen-Six" is to be exhibited for the next two days. It is a certainty that Mr. Winton's latest creation will be thoroughly examined by the many interested in the engineering work of this pioneer of automobiling.

# HOW THE CHICAGO EXHIBITORS WILL BE PLACED

AFTER all Chicago again will have the truly national automobile show this year: November 30 to December 7. The members of the rival associations, the Association of Licensed Automobile Manufacturers and the American Motor Car Manufacturers' Association, will sink their differences, at least on show matters, so that the Coliseum and its annex and the First and Seventh Regiment Armories will shelter the "Licensed" and "Independents" alike, not to speak of the many that owe allegiance to neither of these bodies.

In order to make more room for the pleasure vehicles, the First Annual National Exhibition of Commercial Vehicles will be inaugurated under the same auspices, the National Association of Automobile Manufacturers, and will hold forth in the

Seventh Regiment Armory. So far twelve manufacturers of cars and six makers of accessories have contracted for space. There will thus be ninety-two exhibitors of complete cars.

Where accessories are concerned, the showing is equally impressive. In the coliseum basement there will be 9 exhibitors, while the galleries will house no less than 118 different exhibits of various small wares. There will be 16 additional exhibitors of accessories in the gallery of the First Regiment Armory, and 6 in the Seventh Regiment Armory, so that in all there will be 237 exhibitors in the Coliseum show and its annex, and 18 at the commercial vehicle show in the Seventh Regiment Armory. These are simply the figures at the present writing, and they will doubtless be considerably augmented.

## COLISEUM MAIN FLOOR—AUTOMOBILES.

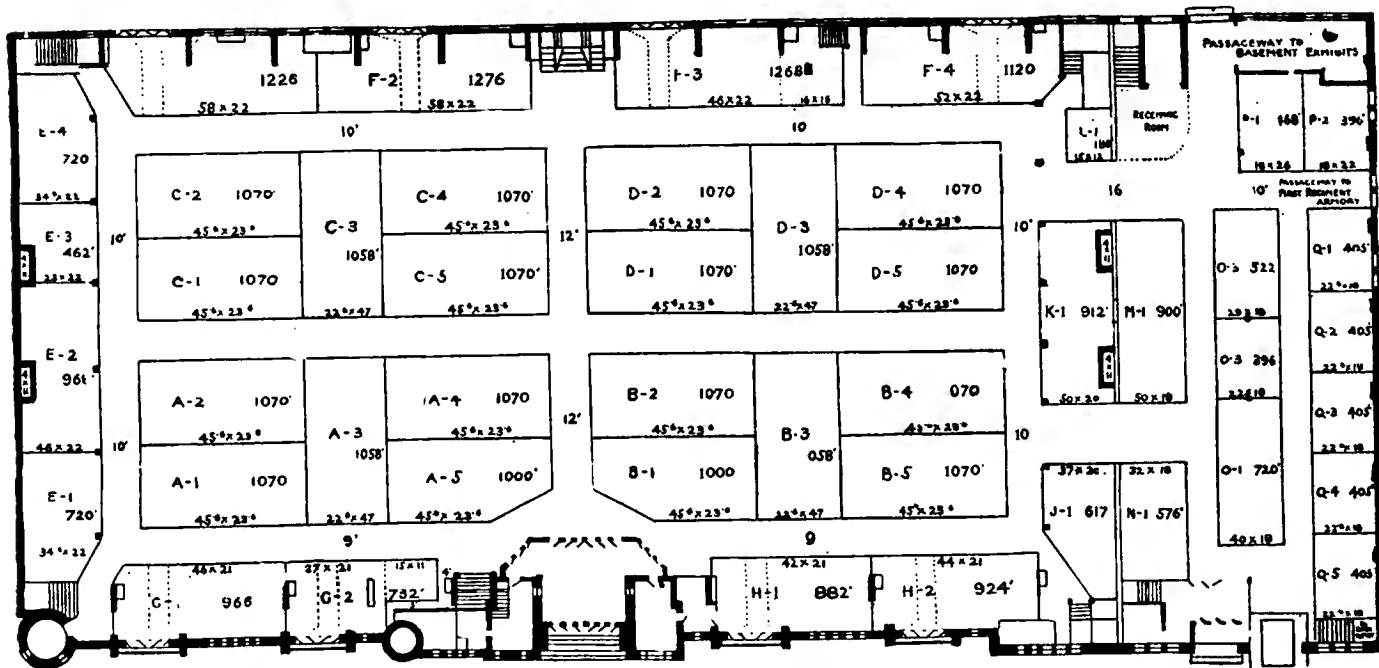

- A-1. Packard Motor Car Company, Detroit, Mich.
- A-2. Locomobile Company of America, Bridgeport, Conn.
- A-3. Wayne Automobile Company, Detroit, Mich.
- A-4. Electric Vehicle Company, Hartford, Conn.
- A-5. Knox Automobile Company, Springfield, Mass.
- B-1. Woods Motor Vehicle Company, Chicago, Ill.
- B-2. Reo Motor Car Company, Lansing, Mich.
- B-3. Studebaker Bros. Manufacturing Company, South Bend, Ind.
- B-4. E. R. Thomas Motor Car Company, Buffalo, N. Y.
- B-5. F. B. Stearns Company, Cleveland, Ohio.
- C-1. Apperson Bros. Automobile Company, Kokomo, Ind.
- C-2. Northern Motor Car Company, Detroit, Mich.
- C-3. Elmore Manufacturing Company, Clyde, Ohio.
- C-4. Olds Motor Works, Lansing, Mich.
- C-5. Lozier Motor Company, New York.
- D-1. Dayton Motor Car Company, Dayton, Ohio.
- D-2. Pope Motor Car Company, Hartford, Conn.
- D-3. Pope Manufacturing Company, Hartford, Conn.
- D-4. H. H. Franklin Manufacturing Company, Syracuse, N. Y.
- D-5. The Bartholomew Company, Peoria, Ill.
- E-1. Babcock Electric Carriage Company, Buffalo, N. Y.
- E-2. Premier Motor Manufacturing Company, Indianapolis, Ind.
- E-3. Matheon Motor Car Company, Wilkesbarre, Pa.
- E-4. Maxwell-Briscoe Motor Company, Tarrytown, N. Y.
- F-1. George N. Pierce Company, Buffalo, N. Y.
- F-2. The White Company, Cleveland, Ohio.
- F-3. Stevens-Duryea Company, Chicopee Falls, Mass.
- F-4. Haynes Automobile Company, Kokomo, Ind.
- G-1. Winton Motor Carriage Company, Cleveland, Ohio.
- G-2. Royal Motor Car Company, Cleveland, Ohio.
- H-1. Thoma B. Jeffery & Company, Kenosha, Wis.
- H-2. National Motor Vehicle Company, Indianapolis, Ind.
- J-1. Waltham Manufacturing Company, Waltham, Mass.
- K-1. Mitchell Motor Car Company, Racine, Wis.
- L-1. Pungs-Finch Auto & Gae Engine Company, Detroit, Mich.

## ANNEX FIRST FLOOR—AUTOMOBILES.

- M-1. Autocar Company, Ardmore, Pa.
- N-1. Dragon Automobile Company, Philadelphia, Pa.
- O-2 and 3. Cadillac Motor Car Company, Detroit, Mich.
- O-1. Baker Motor Vehicle Company, Cleveland, Ohio.
- P-1. Deere-Clark Motor Car Co.
- Q-1. Welch Motor Car Company, Pontiac, Mich.
- Q-2. Peerless Motor Car Company, Cleveland, Ohio.
- Q-3. Peerless Motor Car Company, Cleveland, Ohio.
- Q-4 and 5. Corbin Motor Vehicle Corp'n, New Britain, Conn.

## FIRST REGIMENT ARMORY—AUTOMOBILES.

- A-1. Buckeye Manufacturing Company, Anderson, Ind.
- A-2. Columbe Buggy Company, Columbe, Ohio.
- A-3. Knight & Kilbourne, Chicago, Ill.
- A-4. American Locomotive Automobile Company, New York.
- B-1. Rauch & Lang Carriage Company, Cleveland, Ohio.
- B-2. Western Tool Works, Galesburg, Ill.
- B-3. Aerocar Company, Detroit, Mich.
- B-4. Gearleee Transmiesion Company, Rochester, N. Y.
- C-1. Cleveland Motor Car Company, Cleveland, Ohio.
- C-2. Moon Motor Car Company, St. Louis, Mo.
- C-3. Pierce Engine Company, Racine, Wis.
- C-4. Tincher Motor Car Company, South Bend, Ind.
- D-1. Austin Automobile Company, Grand Rapids, Mich.
- D-2. De Luxe Motor Car Company, Detroit, Mich.
- D-3. Jackson Automobile Company, Jackson, Mich.
- D-4. American Motor Car Company, Indianapolis, Ind.
- E-1 (W. 1-2). Chicago Coach & Carriage Company, Chicago, Ill.
- E-1 (E. 1-2). Staver Carriage Company, Chicago, Ill.

### ANNUAL MEETING OF LOGAN COMPANY.

CHILlicothe, O., Sept. 9.—The regular annual meeting of the stockholders of the Logan Construction Company of Chillicothe, O., was held at the company's plant on the evening of September 3, a large majority of the stock being represented.

Reports of the company's business for the past year were gone into in detail and found most satisfactory. The regular quarterly dividend on the preferred stock was passed and the following directors were elected: Jos. L. Schilder, B. A. Gramm, Geo. F. Hunter, Geo. H. Smith, C. F. Smith, John Kellohofer, W. A. Hall, E. L. Bergman and B. E. Stevenson. The stockholders present inspected the new models which are in course of construction for the season of 1908 and were impressed with the fact that the trucks which are being turned out are the most perfect, strongest, and most efficient which the company has ever been able to manufacture. The Logan starts on its new year with every prospect of success.

Recently Mr. Gramm, who has been the general manager of the company since its inception, assumed, in addition to his other duties, that of buyer, succeeding Mr. Twyman. The latter also had been sales manager, B. E. Stevenson succeeding him.

### YOUTH WREAKS HAVOC WITH TIRES.

CHESTER, CONN., Sept. 9.—Finding time heavy on his hands and the facilities abundant, Edwin Priest, a 17-year-old boy of this place, living on the pike between Chester and Tylerville,

WHAT THE CONNECTICUT YOUTH BROUGHT FORTH TO TEST TIRES.

exercised his mechanical ingenuity on a contrivance that has at once brought him fame. So far as known, he has no particular grudge against autoists, but probably pneumatic tires struck him as easy game worth hunting. He set to work, and with the aid of three knives abstracted from the cutter blade of a mowing machine, an old chisel and a supply of ample-sized wire-nails, he evolved the fiendish devices shown in the accompanying photograph. To make them more effective he ground the edges of the various cutters, and then carefully concealed one of the boards in each of the ruts of a narrow part of the road. Having placed them to the best advantage, the inventor retired to the shade of the cornstalks and watched. W. H. Scoville, of Hartford, Conn., came bowling along in his car and passed over the trap serenely; few inventions have ever worked more admirably on the occasion of their first trial. Before going 100 yards Mr. Scoville realized that three of the car's tires were flat, and examination showed the job to have been a most thorough one. Search was made for the cause during the wait for repairs, and Priest's devices were soon unearthed. They were turned over to F. B. Cooley, of Hartford, who happened along in his machine, and he handed them over to Highway Commissioner McDonald, who caused Priest's arrest. He was fined \$7 and costs, amounting to \$27.11.

THE BURMAN-PARKHURST PARTY IN THE PEERLESS "SIX."

### PEERLESS "SIX" ON A LONG JOURNEY.

At the end of two years of careful study, Charles Schmidt, designer for the Peerless Motor Car Company, of Cleveland, has completed a six-cylinder car of 57 horsepower. This car is a marvel in design and construction. Its motor construction is along the same general lines as the new Model 18, which is the new 30-horsepower model offered for the season of 1908. After severe tests and try-outs already given the car, E. H. Parkhurst, vice-president of the Peerless Company, with a party including Charles Burman, who has driven a Peerless car with perfect score in the last two Glidden tours, left Cleveland, September 4, for a pleasure tour through the East. Leaving Cleveland, the route included Pittsburg, Bedford Springs, Baltimore, Philadelphia (where two days will be spent), New York (two days), Boston (two days), then through the Berkshire Hills to Albany, through the Mohawk Valley to Utica, Syracuse, Rochester, Buffalo, along the lake shore to Cleveland. The trip will take about ten days.

### HANSHUE BREAKS CALIFORNIA RECORD.

Striving after inter-city records is still a popular pastime in California, and the latest attempt on the Los Angeles-Bakersfield time of 8:37, has just been lowered to 7:18 by Harris Hanshue, driving a 20-horsepower Reo. The distance is 100 miles, and represents a continuous climb, many of the grades being very long and stiff, some being given as high as 30 per cent. for a mile or more at a stretch. The roads are far from being favorable, and to vary the monotony of always climbing there are no less than sixty-seven fords to be crossed on the way, some of them being almost three feet deep. In fact, the roads are considered the roughest in that part of California. The run was made without a mishap of any kind.

HANSHUE AND THE REO WHICH LOWERED A CALIFORNIA RECORD.

STEEL EXPERTS AT PLANT OF UNITED STATES STEEL CO., CANTON, O.

### FORD COMPANY TESTS VANADIUM STEEL.

Considerable interest has attached to the great amount of attention devoted by the Ford Motor Company, Detroit, Mich., to the production of vanadium steel in commercial quantities for use in automobile construction, and this culminated in the recent making and rolling of the last batch of this steel by the Ford experts at the plant of the United Steel Company, Canton, O. The "heat" consisted of 45 tons of vanadium-chrome steel for crankshafts, and was made under the personal supervision of C. H. Wills and F. Griffith, metallurgists of the Ford Motor Company and the United Steel Company, respectively. Those present were: O. F. Transue, Transue & Williams Company, Alliance, O.; H. W. Alden, Timken Roller Bearing Company, Canton, O.; F. W. Hedglund, Hedglund Mfg. Co., Canton, O.; H. C. Haight, F. C. Groth, Cleveland-Canton Spring Company, Canton, O.; C. W. Cathcart, Hess-Pontiac Spring Company, Pontiac, Mich.; C. H. Wills, E. S. Huff, Ford Motor Company; C. L. Bockus, Western Malleable Company (drop forge department), Detroit; D. Goddard, White Company, Cleveland; B. F. Little, sales manager, and Harry R. Jones, secretary, U. S. Steel Company, Canton, O.

### HOW KNOX COMPANY WILL RENEW.

SPRINGFIELD, MASS., Sept 9.—Creditors of the Knox Automobile Company, which recently made a voluntary assignment, met last week, Wednesday, to formulate plans for the reorganization of the company. About 75 per cent. of the indebtedness was represented and practically unanimously adopted a scheme presented by a committee of five creditors, providing for the capitalization of the company's debts of \$500,000 into 8 per cent. cumulative preferred stock and making the company's present capital stock \$360,000 common. A. N. Mayo, the receiver, will continue until the reorganization is perfected. Under the new arrangement the creditors will have complete control of the company's business.

The net earnings of the company, after the payment of the 8 per cent. dividends, less the moneys required for working capital, will be applied under the new arrangement to the retirement of the preferred stock. All claims of less than \$100 will be paid in cash. For all claims over \$100 preferred stock of a par value of \$100 will be issued for every \$100 of indebtedness, except that any indebtedness over \$100 or a multiple thereof—that is, a fractional part of one share—shall be paid in cash. The preferred stock will bear the date of January 1, 1908, and the indebtedness to be capitalized will bear interest up to that date.

The committee of creditors appointed to confer with the stockholders and suggest a plan of reorganization consisted of Robert A. Knight and C. C. Lewis, Springfield; Walter V. Morse, Marlboro; Clarence E. Whitney and Arthur Hyde, Hartford, Conn. About 200 creditors, holding claims against the company of \$8,000, will be paid in cash under the new arrangement.

### EMILE LAMBERJACK RETURNS TO PARIS.

After a brief visit of fourteen days in America in connection with the affairs of the Michelin Tire Company, Emile Lamberjack sailed to-day on the French Line steamer for Paris. In an interview before leaving M. Lamberjack declared that the American Michelin factory would start operation in one month, and that the American-made tire would be on the market in about two months.

### KINGSTON FROM KINGSTON IN A. M. C. M. A.

Among the late concerns to be admitted to membership in the American Motor Car Manufacturers' Association prior to the allotment of space for the Grand Central Palace show, was the Kingston Motor Car Company, of Kingston, N. Y., in which are interested E. R. Thomas and O. F. Thomas, the New York bankers and motor enthusiasts; F. E. Moscovitz, well known in the trade, and W. Gould Brokaw.

### CLEVELAND TO HAVE N. Y. HEADQUARTERS.

As a part of its plans for the selling season of 1908, the Cleveland Motor Car Company, Cleveland, O., builders of the car of the same name, will make its headquarters in New York City on and after October 1. No changes will be made in the manufacturing end, the complete chassis being shipped from Cleveland to New York, where the finishing will all be carried out by a well-known firm of coach builders, the entire distribution of the Cleveland product being handled from this end in future.

### CONTINENTAL'S CREDITABLE PERFORMANCE.

Doubt has frequently been expressed as to the genuineness of the many high-gear stunts arranged by the publicity man, so that as a condition precedent to showing what the Continental could do in this respect C. S. Johnston, the car's designer, not only locked the shifting mechanism in the high-speed position, but also disconnected the lever. Accompanied by E. T. Hale, the New Haven, Conn., agent of the Knox, Mr. Johnston left the New York headquarters at 1,359 Broadway at 6 P.M. last Thursday evening. By taking the route via White Plains, South Norwalk and Bridgeport, a great many hills were included, in addition to which much of the road was in process of repair and very rough. In the entire distance of 90 miles it was only necessary to allow the car to slide down one hill backward in order to get a new start, and New Haven was reached at 9 P.M. There were still some doubting Thomases, and, to show them, Mr. Johnston took the car out to Canner street hill, New Haven, the next day. The road is rough, and the grade is reputed to be 18 per cent., while it is said that it has never been taken on the high-gear before. From a standing start on Whitney avenue, the ascent was made without difficulty.

C. S. JOHNSTON TACKLING A STIFF GRADE WITH HIS CONTINENTAL.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The annual show luncheon of the American Motor Car Manufacturers' Association will be given at the Manhattan Hotel, Tuesday, October 29, of the week of the automobile show at the Grand Central Palace.

In spite of all the 24-hour races that have been held, the National still holds the honor of having the record performance of 1,094 3-16 miles to its credit. The National also holds the 1,000-mile track record, having covered that distance in 21:58:00. The drivers were Jack Clemens and Charles Merz.

From now on Toledo, O., will be surrounded by a cordon of warning signs bearing the curt notice "Slow down to ten miles an hour." There has been much complaint on the score of speeding on roads leading into the city, and after considering various suggestions the local officials have adopted this as one method toward curbing it.

The Automobile Dealers' Association of Pittsburg has just received its charter. It was incorporated with a capital of \$5,000, and the following officers were elected: Treasurer, W. N. Murray, of the Standard Automobile Company; directors, W. H. La Fontaine, of the Atlas Automobile Company, and A. L. Banker, of the Banker Brothers Company.

While driving on the Lancaster turnpike near Wilmington, Del., John Ruth and a companion had an unusual experience. Without warning an automobile crashed into them in the dark, upsetting the buggy and throwing them out. The owner of the car inquired as to the damage, and without further words shoved a \$20 bill in Mr. Ruth's hand and was off.

The Rainier Company makes announcement that it was a 35-horsepower Rainier, not a Mercedes, as was stated in two New York dailies, that enabled J. P. Morgan to catch the Pittsfield express at Lee, Mass., recently, he having missed the train at Pittsfield. The trip of twelve miles was made in Charles Lanier's car, which is a Rainier.

That trade conditions are not alone not as black as they are painted, but not black at all, is amply evidenced by the order which W. H. Kirkpatrick, sales manager of the Peerless Motor Car Company, Cleveland, O., carried away with him from Philadelphia on the occasion of his recent eastern trip. The order is for a large number of Model 18, the Peerless 1908, and delivery is required by November 1.

Early requests for Dragon agencies have necessitated tours of inspection of the ground before placing contracts for 1908, and as a result President John Kane Mills and Sales Manager A. L. Kull, of the Dragon Automobile Company, have been making an extended tour of the Eastern States, while John W. Haynes, assistant sales manager, has been carrying on the same work in the South and Southwest.

The Standard Roller Bearing Company, of Philadelphia, has recently made large additions to its plant. The buildings extend over a half-mile of ground from end to end, having a floor space of over 500,000 square feet. The concern employs over 1,500 men.

The business has grown to such proportions as to necessitate the establishing of a department of publicity, which will be conducted by C. Dickens Sternfels, who has been identified in a similar capacity with the Arthur Koppel Company, Pittsburg, Pa., for the past three years.

For the purpose of testing out one of the new 60-horsepower Thomas cars, it was recently sent on a 1,000 mile trip from the works at Buffalo, N. Y., with the intention of covering that distance in three days. In addition to Montagu Roberts, who drove, George Salzman, Mason Hatch, M. Chedru, Edmond Thomas, and Mr. Haas, representing the sales and mechanical departments of E. R. Thomas Motor Company, rode in the car. The 1,000 miles scheduled were covered in 2 days 15 hours, and immediately upon its arrival at the Houghton garage in New York City, on Sunday morning, the tanks were refilled and the return trip to Buffalo undertaken, arriving there early the next day.

W. D. Newerf, Pacific Coast representative of the Goodyear interests, is getting considerable advertising for the Goodyear tires out of the unusual performance of a tourist racer during the coast track campaign. The car was raced at San Bernardino, Los Angeles, Lakeside, Fresno, Sacramento, San Francisco, Seattle, Portland, Everett and Salt Lake City, or 26 events in all, ranging from 3 to 25 miles, winning a majority of them. From the time the car left Los Angeles until it returned, it was not necessary to change one of the original Goodyear tires. The W. D. Newerf Rubber Company now has stores in Los Angeles and San Francisco and agents in Fresno, San Diego, San Jose, Portland, Seattle and other towns on the coast.

### NEW AGENCIES ESTABLISHED.

The O. L. Gooden Motor Car Company, 541-543 Ellicott street, Buffalo, will handle the Winton in that city next season. The company was recently organized with Mr. Gooden, who is an experienced automobile salesman, at its head.

For the benefit of the Southern California trade, Morgan & Wright have just opened a new branch house at 118-120-122 East Tenth street, Los Angeles. The M. & W. business on the Coast has grown so rapidly during the past year that it was found impossible to handle it properly from the San Francisco branch. The Detroit rubber goods makers will carry a complete line of their products at the new branch and make it one of the best equipped rubber stores on the Coast.

### PERSONAL TRADE MENTION.

Frank G. Dwight, Jr., for the past two years with the Knox Automobile Company, has just taken charge of the Philadelphia office of the Jones Speedometer Company.

C. A. Gilmore, general representative of the Knox Automobile Company, Springfield, Mass., has resigned to become associated with the Boston branch of the White Company.

Arthur Lesser, for some time connected with the sales department of the Rainier Company, has just gone with Wyckoff, Church & Partridge, and will be associated with A. J. Picard in the Starns department.

W. M. Botto, sales manager of the Palmer & Singer Manufacturing Company, is visiting the Matheson agents throughout the Western States for the purpose of instructing them regarding the improvements incorporated in the 1908 models.

G. G. Westerfield, secretary of the Westerfield Motor Company, Anderson, Ind., manufacturers of gasoline engines, has just joined the forces of the Staver Carriage Company, Chicago, as superintendent of the latter concern's automobile department.

W. A. Woods, formerly connected with the New York branch of the Oldsmobile Company, has just become identified with the interests of the Cleveland Motor Car Company, Cleveland, O., having taken up the duties of sales manager of that concern September 1.

F. A. Nelson, who has represented the Diamond Rubber Company in Southern California through the San Francisco office for the past two years, has just been appointed manager of a new branch house about to be established at Los Angeles, at 1207-1209 Main street. Mr. Nelson has already taken up his new duties.

R. E. Ingersoll, who has acted as a special representative for the Reo and Premier cars in the Central States for the past two years, has been appointed sales manager for the New York branch of R. M. Owen & Company. Prior to taking on the lines in question he was identified with the sales department of the Pope Manufacturing Company for four years.

### NEW TRADE PUBLICATIONS.

The Bridgeport Vehicle Company, Bridgeport, Conn., builders of high-grade automobile bodies and whose factory is devoted exclusively to automobile work, has issued a circular showing the ample factory of the company and illustrating the special type of limousine body for which the house is noted. The company builds bodies to order, both of wood and of aluminum, to fit any car.

"Bulletin Number 13" is the title of the latest piece of literature to come from the publicity works of the White Company, Cleveland, O., and it is devoted almost entirely to an attractively illustrated description of the genesis of the White steamers, showing the highly developed methods of production on a large scale. The principal departments and their work are all shown photographically, giving some idea of the extent of the plant, which has been made proof against fire to such an extent that the company carries its own risk. A few pages of the bulletin are devoted to an announcement of the new White models for 1908, which show but few changes as compared with their predecessors of the present season, while the prices remain the same.

## The Safest Way to Store Gasoline

The NATIONAL is the only pump that discharges gasoline at every movement of the crank; it saves one-half the labor and one-half the time to pump gasoline; there is no evaporation or leakage; the tank is buried underground; the pump may be put in the building in a convenient place. It is the safest way because it meets all of the requirements of The National Board of Fire Underwriters.

For a Garage owner the National portable wheel tank will enable you to fill a car quickly by pushing the wheel tank by hand to the car. It is easily handled even in case the car would be at the curb.

The NATIONAL is also adapted to private motorists, also for lubricating oil storage. Ask for catalogue—it will explain all about the National System.

DAYTON, O.**

# THE AUTOMOBILE

## One Clean Score Survivor: Gaeth in Cleveland Sealed Bonnet Efficiency Test

By W. F. Bradley

CLEVELAND, O., Sept. 13.—A four-cylinder Gaeth, driven by its owner, Paul Gaeth, was the only contestant which survived with a perfect score the stringent three-days' sealed bonnet contest organized by the Cleveland Automobile Club. J. W. David, piloting a Mora, secured second position with only twenty-five points penalization, incurred through an accidental stalling of the engine when a broken chain blocked the rear wheel. A four-cylinder Buick, but a few hours out of the factory when H. J. Trumbull took charge of it, finished third with forty points against it for taking water on two occasions. All three machines completed the run with their seals intact, the Gaeth in addition having the honor of never stopping its motor except when authorized to do so in control. Had not the Buick run out of gasoline two miles from home, its engine would never have stopped on the run. Less fortunate were the two Cartercars, driven by B. J. Carter, and A. W. Hall, with 549 points and 771 points penalization; the two-cylinder Buick, with a broken driving chain, and two Jacksons, which retired on the first day.

The three utility tests planned by the Cleveland Club failed to draw the support they deserved. No maker of electric vehicles thought it worth while to submit his product to the ordeal outlined by the contest committee. But two commercial vehicles entered the strenuous ranks, and one of these combined the competitive test with its work-a-day duties.

Eight pleasure vehicles responded to the invitation to run over Ohio mud roads for three days with seals on everything sealable and a rival observed to record the good and the bad. Cleveland automobile manufacturers, with a reputation extending far beyond the city limits, were unanimous in declaring that the wrong date had been chosen for the test; some were of opinion that local club events should be abandoned in favor of bigger national competitions, and a few criticised the conditions.

Certainly the rules did not err on the side of leniency; in their endeavor to provide a more comprehensive test than is usual in reliability runs, the committee sacrificed itself unreservedly and would probably have found its self-imposed task too great to keep out criticism but for the ungrudging executive work performed by Chairman George H. Bowler, Walter C. Baker and L. S. Buschman. The seals on the bonnet and coil box could only be broken at a cost of 50 points penalization; 5 points a minute was the price for repairs or adjustments; each involuntary stop of the motor added 25 points to the blacklist, and water could only be had at the rate of 5 points per minute for time spent pouring it in.

For the second day's run of 156 miles to Warren, Ashtabula, and return, the four-cylinder Buick and the Gaeth started out with a clean record, while the Mora, the two-cylinder Buick, and the two Cartercars had against them the varying penalizations of the first day. After the brick pavement of suburban Cleveland,

heavy going was experienced to Chagrin Falls. Onward to Warren, conditions were a little better; but the latter part, from Warren to Ashtabula and home to Cleveland, was punctuated with heavy showers and was over surfaces unworthy to be called

MESSRS. BOWLER, BUSCHMAN AND BAKER WERE A BUSY TRIO.

roads. The Gaeth, the Mora and the two Buicks, however, came through with flying colors, reporting to headquarters on time and without a black mark laid up against them on the observers' cards. Both Cartercars fell during the day, No. 22 being obliged to break the seals to change a cracked spark plug and No. 21 having to renew the water supply after the engine had been stalled.

Along the banks of Lake Erie to Sandusky, on the morning of the third day, was one of the pleasantest rides west of Cleveland. Road conditions having improved, all six machines bowled along at a merry pace in full hopes of terminating without a blemish. Near Monroeville misfortune befell the party. On taking a turn a front tire of the White steamer confetti car came off the rim, rendering the automobile unmanageable. Bert Adams, who was at the wheel, did his best to get the car round the turn, and was assisted by Mertin A. Phillips, who instantly realized the danger on hearing the report, but it was in vain. The car crashed into a telegraph post, cut it down, swung with its rear against a tree and collapsed. One of the rear springs broke under the blow, pierced the gasoline tank and caused an explosion. The two men in front jumped for safety, but did not altogether escape the flames. Fred Baird and J. Lec Cross were enveloped in fire before they could even make an effort to escape from the tonneau, and suffered very severe burns about the head, hands and feet. In addition J. Lee Cross had his shoulder dislocated by the telegraph pole as it fell across the car.

**Difficulties Followed Accident.**

As they came along, all contestants were held up and only started out again when the injured men had received medical attention and been put on the train for Cleveland. The unfortunate occurrence, however, disorganized the run. W. W. Parttridge's Stearns, the official car which arrived first on the scene, was given the confetti and sent ahead. Carbureter troubles came along and the lead had to be transferred to a man unfamiliar with the road. Instead of running to Oberlin, as laid down on the route, a straight course was laid for Elyria through some small town torn up from end to end by a street railroad constructor. Nine miles were saved, but the going was

of such an acrobatic nature that all were heavily handicapped.

The four-cylinder Buick, for instance, had been running for a couple of hours with a broken front spring without any apparent inconvenienc, but was subjected to an unreasonable strain when called upon to plough through torn up streets, run over building plots, and scramble over half-laid railroad tracks. The engine never stopped, the seals were intact, but water had to be added twice and the first penalization was incurred.

Paul Gaeth's four-cylinder Gaeth ploughed across country valiantly, running on three cylinders for the last few miles, but still reaching control on time, with seals unbroken and without any additions to its cooling water. Its reward was the only perfect score earned in the contest.

J. W. David's Mora, a veteran of the Chicago and New York sealed bonnet contests, went through a series of road accidents during the last few miles. Notwithstanding the engine never stopped, the seals were untouched and control was reached on time. But for the accidental stalling of the engine on the first day the Mora would have tied with the Gaeth for honors.

The Cartercars both incurred penalizations through leaky pipes, causing the loss of water. Both, however, came in with the engine and transmission in excellent condition. Most unfortunate of all was the two-cylinder Buick. When climbing over a heap of dirt, with exposed car lines on one side and a ditch on the other, the single driving chain broke. No spare links being carried, a messenger had to be sent to Cleveland for the necessary repair material, the result being such a late arrival home that the day's penalization was never computed.

**Commercial Vehicles Performed Faultlessly.**

Each day the single-cylinder Gaeth delivery wagon and the four-cylinder truck manufactured by the American Motor Truck Company, of Lockport, N. Y., ran according to schedule through Cleveland and suburbs.

**Daily Record of Penalizations.**

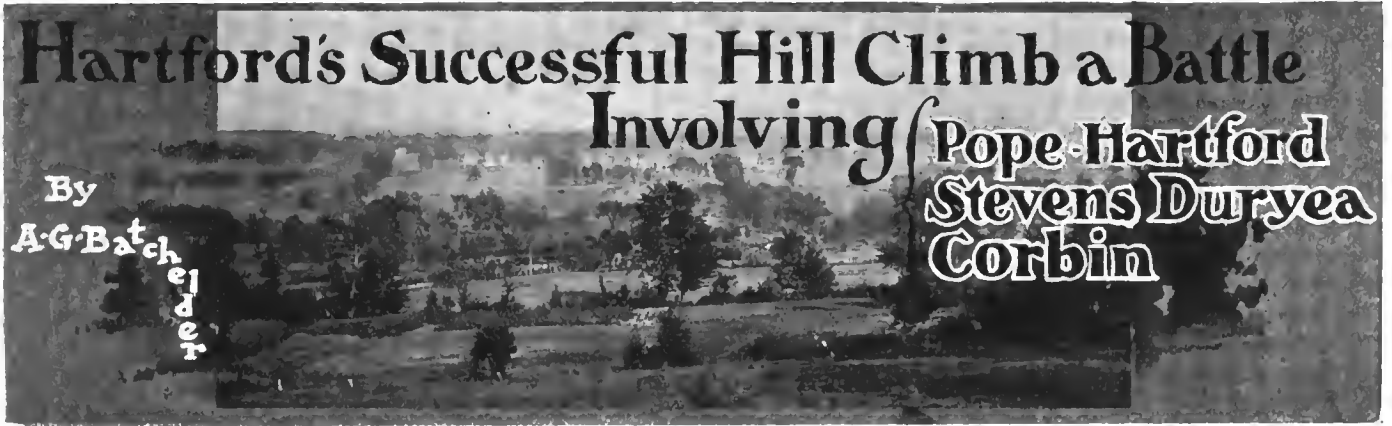

Car	Driver	First Day	Second Day	Third Day	Total
Gaeth, 4-cylinder.....	Paul Gaeth .....	0	0	0	0
Mora, 4-cylinder.....	J. W. David.....	25	0	0	25

# Hartford's Successful Hill Climb a Battle Involving Pope-Hartford Stevens Duryea Corbin

By A. G. Batchelder

HARTFORD, CONN., Sept. 14.—The first annual hill-climb of the Automobile Club of Hartford supplied spirited contests and had only one accident, and that of a minor sort, despite the fact that the onlookers invaded the road whenever their curiosity got the better of them, which was frequent. Speed is the interesting factor nowadays, and this was made dangerously apparent when the thousands started home while the hill was still being used by the participants in the high-gear slow event. Previously in '56 2-5 the Pope-Hartford, with clever Grady at the wheel, had ascended the three-quarters of a mile climb, which had a maximum 16 per cent. grade until near the summit, when it became 21 per cent., and also possessed a sharp turn more than half way up. Here the two startling events of the day happened. Only one-fifth of a second less was the upward trip of the Stevens-Duryea "Little Six," "Pete" Robinson at the wheel. Corbett, one of the stars of the New York Motor Club 200-mile Albany endurance run, made the journey with a Corbin air cooler in :57. These three were the best climbers of the day, and it all happened in the free-for-all, which event demonstrated the unthinking attitude of the public, for these cars were stripped and denuded.

The man who tours, it would seem, would much prefer to note how good a regularly equipped stock car could make an ascent, rather than to enthuse over skyrocket performances.

There were two ties, one in the smaller runabout class and the other in the larger runabout division, but the desire of the spectators to get home in time for supper—Hartford is in New England—made impossible the deciding of any ties, for the course was flooded with cars and pedestrians. Therefore, the local agents of the Maxwell and Ford will spend more money in their printer's ink battle in the local papers and thus attract a substantial amount of paying publicity. Honors, thus far, are even.

It was possible to see from the top of the hill the starting point at the bottom, owing to the turn in the road, though one might prefer on the next occasion that there be wire communication between base and summit rather than a flag signal even when given by such an experienced one as Starter Hiram Percy Maxim. Clerk of the Course C. H. Gillette was energetic, while F. H. Elliott, A. A. A. secretary, learned of the duties of a referee.

There were all sorts of notables up and down the hill, including such trade figures as J. D. Maxwell, M. S. Hart, Col. George Pope, Charles and Wilbur Walker, D. J. Post, C. H. Veeder and Clarence Whitney, while those present also included S. L. Haynes, ex-president of the Automobile Club of Springfield; A. E. Corbin, another prominent Springfielder; W. F. Fuller, president of the Connecticut State Automobile Association, as well as of the local club; G. K. Dustin, secretary of the two organizations, and Leonard D. Fisk, one of the few at the first Florida meet.

From the finishing point of the climb a magnificent view was obtainable, embracing the Glastonbury range, the Granby hills, and the Simsbury peaks, and, from base to summit, Prospect hill was lined on both sides of the road with thousands of very curious spectators who craved speed rather than practical results.

These onlookers secured one thrill when Driver Dennison overturned at the dangerous corner in throwing a tire of his Knox car. He was dragged from underneath little worse for the experience. Subsequently, Robinson and the Stevens-Duryea "Big Six" skidded at the same place, and a police sergeant, in endeavoring to keep back the crowd, got in the way of the big car itself and had some difficulty in saving himself from injury. Summary:

CORBETT AND AIR-COOLED CORBIN STARTING FOR THE SUMMIT.

FLEMING AND THE MAXWELL WHICH CLIMBED STURDILY.

PAUL HOFFMAN, TWO-TIME WINNER, IN HIS PIERCE CAR.

CHICAGO, Sept. 14.—In the second annual fuel-economy test, organized by the Chicago Motor Club and the Chicago Automobile Trade Association, a 28-32-horsepower Pierce, driven by Paul Hoffman, was most economical, its gasoline consumption for the 95-mile journey to Valparaiso and back being equal to 20.7 miles to the gallon. Last year Paul Hoffman won the first test of this nature in a 50-mile run to Cedar Lake.

Very close to the winner was a 24-horsepower Berliet, driven by J. Buchanan, the actual difference in amount of fuel on the two cars being but four ounces, while the number of points according to the weight formula used gave a variance of but .031.

Twenty-four cars—a very representative American bunch—entered for the economy test. Gasoline was officially measured out, poured into the tanks and seals attached over night, and the competing machines left in the care of a guard until starting time on Friday morning. Five minutes before 7 o'clock the pilot car, a six-cylinder Ford, with R. P. Rice at the wheel, took up the confetti bags and went away to lay the trail. There was little danger of going astray, for the Illinois Signboard Commission had inaugurated its campaign by placing guide posts over the course. In addition, cardboard signs with red arrows on them smoothed away the complications between Chicago and Highlands. Orders were that no competitor should be allowed to exceed the schedule of five hours' running time. Ideal weather conditions prevailed for a competition of this nature, but the road surface furnished an unusual quantity of puncture-producing material, which lengthened the running time. On arriving home the competing machines were again handed over to the technical committee for verification of their surplus fuel, and exercises in arithmetic were indulged in to determine the winner and official positions.

Irrespective of weight, the smallest amount of gasoline used by any one

car was 2 gallons 3 quarts 15 ounces by the 15-horsepower Ford runabout driven by T. J. Hay. A 10-horsepower Holsman had the next smallest appetite, with slightly over three gallons. Worked out on the weight basis, however, the machines with the lowest net consumption were by no means as high in the list as those with heavier loads. The rules on which the test was based gave an advantage to the heavier vehicles; this was evidenced by the general desire to obtain heavy men as passengers. Last year's New York record, established by the Franklin, when 87 miles were covered on two gallons of gasoline, was never in danger of being thrown down.

The first ten cars on the list are qualified for a subsequent 200-mile economy run for the \$500 Knight cup, at a date to be arranged later. They comprise two Pierce Arrows, two Berliets, Silent Knight, Diamond T, Locomobile, Corbin, Haynes and Apperson. Although the difference between two succeeding cars on the official table, as worked out on the

percentage basis, is but slight, there is a wide difference in the actual fuel used by the most economical and most prodigal of the automobiles. The quantity varies from 2 gallons 3 quarts 15 ounces to over 8 gallons for less than one hundred miles. Thus, though the leaders made a remarkable run, No. 6 Pierce Arrow, No. 3 Berliet and No. 1 Pierce Arrow being very closely grouped, a number were far from being up to the standard which might be expected of them. In a test, the basis of which is the lowest possible consumption of fuel, the skill of the driver is a most important factor. Making allowance for varying degrees of ability, the official table indicates that about a third of the machines were either not properly tuned up to the highest pitch of efficiency or were naturally wasteful in their use of fuel. Due attention has not always been given to the subject of economy in fuel, but indications are that with the increasing perfection of the automobile, users will be more and more exacting in their requirements under this head and that a contest such as that planned and carried out so successfully by the two Chicago associations

ENTIRE POPULATION OF WHEELER, IND., WITNESSES THE BERLIET PASS BY.

HOLSMAN CAR TAKING ITS FUEL QUOTA BEFORE THE START.

will be more numerous in the future than they have been in the past. Twenty miles to the gallon, given by the leading cars, is an excellent performance, unfortunately not attainable with every make of automobile.

**THAT BOULEVARD FROM BUFFALO TO NIAGARA.**

BUFFALO, N. Y., Sept. 16.—For the greater part of the way from Buffalo to Niagara Falls the river road is a nightmare. The Automobile Club of Buffalo has been interested in the project of a proposed boulevard for some time past, and E. R. Thomas has consented to accept the chairmanship of a working committee which the club has deemed it advisable to name. It is only a question of time before this broad boulevard from the Queen City to the great cataract will become a reality instead of a dream.

WHERE MIGHT MAKES RIGHT OF WAY, AND NO ARGUMENT.

**DARRACQ RECORD FEATURE AT PITTSBURGH.**

PITTSBURGH, PA., Sept. 14.—On the resumption of racing at Brunot's Island track, William McCulla, driving a Darracq stripped touring car, covered 50 miles in 58:40 3-5, beating the Point Breeze record, established by William Wallace, also on a Darracq, by 3:7 2-5.

There were six starters in the race, namely: Two Stevens-Duryea, driven by James Kerr and C. A. Collier; Columbia, driver Eddie Bald; Pope-Hartford, driver C. H. Bromier; a Franklin, owned and driven by Mr. Palmer, and the Darracq. The two Stevens-Duryea got away first and held the lead until the fifth lap, when McCulla's Darracq got into second position. On the tenth mile Kerr's Stevens-Duryea led by a quarter of a mile. On the seventeenth mile the Franklin dropped out, and on the twenty-second mile Collier's Stevens-Duryea withdrew for fifteen minutes, came back and ran a mile, then abandoned altogether. At half distance Kerr's Stevens-Duryea was leading on the Darracq by barely 100 feet, time being 29:04.

After a neck-and-neck struggle for one mile between the Stevens and the Darracq, the former got ahead again, but shortly after the American machine withdrew and the Darracq took first place and held it to the end. The Stevens-Duryea came back for a short time, then withdrew. The only other car on the track at the finish was the Pope-Hartford.

Other events included an exhibition race between Barney Oldfield's *Green Dragon* and Ollie Savin in the *Red Devil*, the former, of course, winning; a two-mile race between a couple of Stevens-Duryea six-cylinder cars, the winning one driven by Tom Dunn; a three-mile handicap, won by a six-cylinder Stevens-Duryea, driven by James Kerr, and an open touring car race, won by Eddie Bald on a Columbia.

**WHAT OLDFIELD SUPPLIED AT CINCINNATI.**

CINCINNATI, O., Sept. 15.—Barney Oldfield made unsuccessful attempts Saturday to lower the world's track record with his *Green Dragon* on the Latonia course. His time for the two miles was exactly two minutes. In the first mile Oldfield got round in 1 minute and 2-5 of a second; on the second mile he was clocked in 59 3-5 seconds. To-day Oldfield covered the two miles in 1:58. In a special match between Oldfield's *Green Dragon* and Eddie Bald's *Red Devil*, Oldfield "won" by a few inches. A. V. Stegman's Stearns, driven by J. R. Rainey, covered twenty-five miles in 29:30, which is a track record for this distance, the best previous performance being 29:45. The car was not stripped in any way, with the exception of the muffler being taken off. After the race the owner got into the car and drove his family home.

The six-hour endurance run was stopped at the end of the fifth hour, when J. Sharp, in a Thomas car, had traveled 188 miles. E. Robinson, in a Franklin, was second, and O. W. Rogers, in a Thomas runabout, third, but so far behind that it was impossible for them to catch the first car.

**OLDFIELD AND EX-MANAGER HAVE A SET-TO.**

PITTSBURGH, PA., Sept. 16.—A long-standing feud between Barney Oldfield and W. H. Pickens, his former manager, came to a head last Thursday night, when the two men exchanged blows in the corridor of the Fort Pitt Hotel. Oldfield caused to have printed an attack upon Walter Christie, in which he declared that the latter had not the steadiness to drive the machine which he had designed. Finding Pickens later, Oldfield renewed the attack upon Christie, who captured at Minneapolis, September 7, the one-mile track record, which he and Oldfield had held jointly for the past year. The old record was 53 seconds, and Christie reduced this a full second. When Christie was injured, September 9, on the first day of the meet here, Pickens came, in response to a telegram, to look after him. Resenting the remarks of Oldfield, Pickens never hesitated in starting the scrimmage, the final outcome of which was the ejection of the *Green Dragon* driver from the hotel.

## POINT BREEZE'S HUNDRED-MILE WON BY A PACKARD

PHILADELPHIA, Pa., Sept. 16.—Over five thousand loyal Quakers yelled their throats raw at Point Breeze track last Saturday afternoon when young Joe Parkin, in a Packard "30," took the lead from Eddie McDuffie's 60-horsepower Mercedes on the eighty-ninth lap of the 100-mile race for the Keystone State Championship for stock cars. True, it was no fault of McDuffie that he lost the lead, which he had taken on the forty-second round. Dirty gasoline had bothered him from the seventieth mile, at which point he had over a lap on his young Quaker rival. McDuffie was bowling along at a remarkably steady pace, averaging around 1:12 for mile after mile. He had set himself a schedule of five miles in six minutes and had figured it out that that pace would win on Point Breeze track. And so it would had the unexpected not happened. His engine began to miss and volumes of bluish black smoke, which trailed after the German car, indicated that something was amiss.

This was young Parkin's opportunity and he began to push his Packard as much as the condition of the track and the ticklish turns would allow. Passing the Mercedes, he set about recovering that lost lap. McDuffie couldn't see his way clear to leave the track and remedy the trouble, for he realized that before he could get going again the Packard would have a comfortable lead, which, with but a score of miles to go, could not be overcome. And he resolved to stick it out, hoping that something might happen to the Packard or his own conditions improve. But they didn't, and each lap saw the irrepressible young Quaker a trifle nearer. It was on the eighty-ninth mile that the youthful Parkin—he's a mere boy—seeing that the big German with the little Irishman at its wheel was in real distress, opened his own engine up wide at the head of the stretch and, passing the crippled Mercedes, laid the groundwork for numerous cases of tonsillitis among the grandstand and clubhouse occupants.

McDuffie hustled into camp on the next lap, but he lost five valuable minutes, and when he reappeared the Packard was almost as many miles to the good. It was too late to save the race, but McDuffie prevented the big Frayer-Miller "50" from pre-empting the place, having a total of ninety-five miles to his credit when the finish gun cracked, as against the air-cooled car's ninety-two, the Thomas Sixty's eighty-nine, and Owen's Packard's eighty-seven.

It is doubtful whether "Kid" Parkin could have won the race without the advice and assistance of his father, who acted as his mechanic. The old gentleman was the real thing, and the non-chalence with which he changed sparking plugs and refilled his lubricators while negotiating the turns at full speed caught the crowd. Once he caught a small can of oil thrown him by one of the Packard assistants, and the car going at a forty-mile clip at

the time! The old gentleman was all over the car, watching everything like a hawk.

Of the seven cars which started, four at some stage of the race held the lead, the winner and the Mercedes twice. Parkin in the Packard (No. 10) went to the front on the seventeenth mile and held it until the forty-second, when the Mercedes took command, only to lose it forty-six rounds later to the Parkin outfit. The Mercedes led at the end of the first mile, after which Tom Berger in the Oldsmobile got in front and stayed there till the thirteenth lap, when "Wally" Owen in the Packard (No. 4) came up strong, to retire four rounds later in favor of the winner.

When the touring car class was called and only two starters showed up at the tape, the Oldsmobile "30," driven by Tom Berger, and the Wayne "30," driven by William Lutton, the officials caused it to be announced that in the event of a walkover the race would be called off. After the Wayne had set the pace for five miles, which had consumed 7:53 1-5 minutes, the officials got their heads together, and, it being evident that the Oldsmobile could win at any time Berger felt disposed to let his car out, a halt was called at the end of the seventh mile and the cup awarded to the Oldsmobile. The summary follows:

### 25-MILE, RUNABOUT CLASS.

1. Packard, 30-h.p.; driver, "Wally" Owen..... 33:05 4-5
2. Frayer-Miller, 24-h.p.; driver, Dan Webster.....
3. Thomas, 60-h.p.; driver, William Coyle.....

### 25-MILE, TOURING CAR CLASS.

1. Oldsmobile, 30-h.p.; driver, T. W. Berger..... 11:00 3-5
  2. Wayne, 30-h.p.; driver, William Lutton.....
- (Race stopped end of the seventh mile.)

### 100-MILE, KEYSTONE STATE CHAMPIONSHIP—OPEN TO ALL.

1. Packard, 30-h.p.; driver, Joseph W. Parkin, Jr..... 2:02:26 4-5
2. Mercedes, 60-h.p.; driver, Eddie McDuffie.....
3. Frayer-Miller, 50-h.p.; driver, Dan Webster.....
4. Thomas, 60-h.p.; driver, Wm. Coyle.....
5. Packard, 30-h.p.; driver, "Wally" Owen.....

### TIME AND POSITION AT END OF EACH FIVE MILES.

Miles	First	Second	Third	Time
5	Oldsmobile	Mercedes	Packard (No. 4)...	6:27 4-5
10	Oldsmobile	Mercedes	Packard (No. 4)...	12:42 2-5
15	Packard (No. 4)	Oldsmobile	Packard (No. 10)...	19:00 3-5

## NEW TRACK RACE RECORD MILE AT READVILLE

BOSTON, Sept. 14.—The fall race meeting of the Bay State Automobile Association, originally scheduled for Labor Day and twice postponed because of unpleasant weather, was successfully held this afternoon at the Readville track. The attendance suffered somewhat from the postponements. The weather was perfect, and the oiled track was very fast. Walter Christie had been engaged to drive a mile and five miles for the records, but his accident at Pittsburgh made it impossible for him to be present. To take his place, Charles Basle, driver for H. L. Bowden, had agreed to drive Mr. Bowden's famous Mercedes, the "Flying Dutchman" of Ormond fame, for the mile record, and Fred H. Marriott, of Newton, holder of the world's straightaway mile record of :28 2-5 seconds, had also been given permission for a

mile trial. Before the races began, however, Basle, in tuning up his car, stripped a timing gear and was unable to start. Marriott, in a preliminary event, damaged his car, so that he, too, could not go for the record.

Though the troubles of Basle and Marriott prevented two events that promised to be among the most interesting of the meeting, the other races furnished ample excitement, and two new competitive records were established. One of these is 54 2-5 seconds for a mile in competition, and was made by L. H. F. Baldwin, of Providence, with his steam racer. It was made in the first heat of what was to have been a mile match, best two heats in three, between Marriott and Baldwin. Marriott's car had troubles and was out of the race when half way round. Baldwin

BALDWIN AND HIS MILE TRACK RECORD STEAM CAR.

won the second heat and race in a walkover and with a flat tire. The other new record is 1 hour 2 minutes 14.4-5 seconds for 50 miles on Readville track, and was made by the 24-horsepower Corbin, driven by J. Mattson, in the stripped stock chassis race for all motive powers. The best previous record was 1 hour 3 minutes 4.5 second, made by the Oldsmobile runabout in the stock runabout race on Memorial Day. The 50-mile chassis race was the most interesting of the day. There were four starters: 40-horsepower Berliet, driven by H. F. Grant; Ross steamer, driven by A. H. Waitt; 40-horsepower American, driven by A. J. Andrews; 24-horsepower Corbin, driven by J. Mattson.

At the start the Berliet jumped into the lead, and in the first five miles had lapped the Ross; the American was second, and the Corbin was third. At ten miles, which the Berliet covered in 11:01, the relative positions were unchanged, though the Berliet had again lapped the steamer and was a mile ahead of the Corbin. The Berliet continued to gain, but it was not until the nineteenth mile that it lapped the American, which by that time led the Corbin a mile. The time of the leading car for twenty miles was 21:15 1-5; for thirty miles, 32:44 3-4; for forty miles, 43:39. With only five miles to go, and making a splendid clip that would have landed it a winner under the hour, the Berliet had tire trouble in the forty-fifth mile. The American, which was two miles behind, also had trouble at about the same time.

The Corbin was then six miles behind, but before the Berliet and American got going again it had made up the difference, taken first place and won the race.

Though unfortunate in this race, the same Berliet car, with Grant driving, was more successful in the twenty-mile stock gasoline runabout event. It won this race in 22:19 1-5, having plenty of room to spare over its nearest competitor, a 40-horsepower American, driven by W. A. Fredericks. A 24-horsepower Corbin, driven by J. Mattson, was third.

The touring car race at twenty miles for stock cars had three entries: 60-horsepower Austin, driven by J. C. Kennedy; 24-horsepower Corbin, driven by H. E. Wilson; 24-horsepower Corbin, driven by G. A. Crittenden. The race resolved itself into a duel between the Austin and the Corbin driven by Crittenden. The Austin won eventually in 24:20, but at the conclusion of the race the Corbin owners entered a protest against the Austin, claiming that it was not equipped as per maker's catalogue, as required by the race conditions. The officials examined the car, but reserved their decision pending the production of a catalogue.

Owing to the accident to the timing gear of the "Flying Dutchman," the match race that was scheduled between that car and the old Napier Gordon-Bennett racer, holder of the Mt. Washington hill-climb record, had to be called off. The Napier, however, with F. C. Hoyt at the wheel, was driven a three-mile exhibition and demonstrated that though it was built some years ago it still has much speed. The first mile was covered in 1:01, the second in 1 minute flat, and the third in 1:01, making 3:02 for the three miles.

J. C. Kerrison, as race manager, had general charge of the meeting, while L. R. Speare acted as referee; H. W. Whipple was chief judge and A. D. Peck starter. The summary:

#### TWENTY MILES, OPEN TO STOCK GASOLINE TOURING CARS.

1. Austin, 60-h.p.; driver, J. C. Kennedy.....24:20
2. Corbin, 24-h.p.; driver, G. A. Crittenden.....  
(Protest filed against Austin.)

#### MATCH RACE, 2 IN 3-MILE HEATS.

F. H. Marriott vs. L. H. F. Baldwin, both driving Stanley steam racers.

First heat won by Baldwin; time, :54 2-5.

Second heat and race won by Baldwin in walkover.

#### TWENTY MILES, OPEN TO STOCK GASOLINE RUNABOUTS.

1. Berliet, 40-h.p.; driver, H. F. Grant.....22:19 1-5
2. American, 40-h.p.; driver, W. A. Fredericks.....
3. Corbin, 24-h.p.; driver, J. Mattson.....

#### FIFTY MILES, STRIPPED STOCK CHASSIS, ALL MOTIVE POWERS.

1. Corbin, 24-h.p.; driver, J. Mattson.....1:02:14 4-5
  2. Berliet, 40-h.p.; driver, H. F. Grant.....
  3. Ross Steamer; driver, A. H. Waitt.....
- Time by Berliet for intermediate distances: 10 miles, 11:01; 20, 21:15 1-5; 30, 32:44 3-5; 40, 43:39.

### MORRIS PARK'S SECOND 24-HOUR GRIND.

The New York Automobile Trade Association is to be associated with the Morris Park Motordrome Club in the promotion of the 24-hour race at Morris Park track September 27 and 28. There are sixty-two members in the Trade Association, and J. G. Robin, president of the Motordrome Club, felt that he would like to enlist their support in the promotion of meets. This will mean that a part of the management of the meet will be in charge of E. V. Stratton, the present manager of the Trade Association.

In addition to the 24-hour event, it is planned to have a 50-mile event on Saturday under road conditions. A special course will be cut through the track that will supply hills and turns, the same as on the Vanderbilt course. There are seventeen entries in the 24-hour contest.

### LONG ISLANDERS HAVE A "GRAND PRIX."

SOUTHAMPTON, L. I., Sept. 16.—On a nine-mile circuit on Shinnecock Hills, Charles L. Lawrence, on a 24-horsepower B. L. M. stock runabout, won the Grand Prix de Shinnecock, distance 45 miles, at an average speed of 50 miles an hour. The race, an invitation event, starting at half-past five o'clock on Saturday morning, was watched by Southampton society people. It will probably become an annual event.

### WHITE WINS, RIVAL WRECKED IN RACE.

LOS ANGELES, CAL., Sept. 13.—In a road race between a White steamer, driven by Capt. H. D. Ryus, and an Elmore, handled by A. J. Smith, from Los Angeles to North Baldy Mountain, distance 100 miles, the Elmore overturned, pinned the driver underneath, and caused such injuries that he had to be carried back by train to Los Angeles. The White covered the distance in 4 hours 31 minutes, winning the \$2,000 stakes.

### SAND AND TAR AS A DUST REDUCER.

YORK, PA., Sept. 16.—Ex-Senator E. K. McConkey, one of the most enthusiastic autoists in Southeastern Pennsylvania, is experimenting at present to produce dustless roads in this locality, and within the past few weeks has reached the zenith of his ambition. Sand and tar, mixed in certain proportions, is the ex-Senator's formula, and while the two are heated to a boiling condition the substance is sprinkled along the road. The Country Club road, just south of York, which has the reputation of being one of the finest auto roads in the Keystone State, has been treated in the above manner and the objectionable dust has disappeared from that thoroughfare. Local autoists are watching the experiment with keen interest.

# BEARING METAL FOR AUTOMOBILE USE\*

By THOMAS J. FAY, E.E.

OF bearing metal there is much that can be said that would not interest the automobile engineer for the very good reason that the vogue in automobile work is to employ ball and roller bearings wherever possible. On the other hand, there are a few bearings in automobiles that are, as a rule, of the plain type, and it probably will be a long time ere plain bearings will become wholly obsolete.

It will be desirable then to discuss the plain bearing question at sufficient length to bring out the facts in relation to the class of plain bearings likely to obtain in automobile work.

To begin with the desired properties of bearing metal will lie within the limits as follows:

- (a) The highest possible resistance to crushing strains.
- (b) The greatest possible heat conductivity.
- (c) The greatest anti-friction qualities.
- (d) The highest possible tensile strength, not obtained at the expense of (b) and (c).
- (e) The nearest approach of the elastic limit to the tensile strength.

These conditions primarily dictate the use of ball or roller bearings, but there are few, if any, engineers that are prepared to put ball bearings in crank pins for illustration, and there are other places not readily fitted with any besides plain bearings.

The materials of which plain bearings should be made must hold the right proportion of suitable elements. The right proportion, on the other hand, must be the quantities that evolve a satisfied chemical condition. Take for illustration cast iron. In this mixture carbon is in excess of the amount that can combine chemically and the excess carbon takes on the graphitic form and lays in stratae enmeshed in the section of the structure. This excess carbon does not add to the strength of the metal, whereas, on the other hand, iron without the excess graphite is far stronger and, to make the matter somewhat more plain, a "cemented" iron or steel bearing in which all the carbon is made to combine by a cementing process becomes a very good bearing and is much used in certain places on motor cars, as, for illustration, the piston pin and its bushing are hardened.

The best possible illustration of the fact that mixtures must combine proper elements in the right proportion will be that shown in a tabulation of lead, tin, bismuth alloys, in which melting point advances and recedes, depending upon the proportion of the components present.

## LEAD, TIN, AND BISMUTH ALLOYS.

LEAD	TIN	BISMUTH	Melting point of	REMARKS
5	3	8	202	It will be observed that a change in relation brings about a change in the melting point, or as may be said the freezing point, or the point of constant temperature during a change in the state of aggregation, but the change is not in proportion to any set of uniformly advancing increments.

Scientific American Cyclopedia, page 11.

To come to the point, what is the most likely to prove the most valuable for bearings is that which shows no excess of any one component over the amount sufficient to produce an "eutectic" alloy. If an excess of some one component is merely a crystalline or granular mass enmeshed in the eutectic, it is more likely than not a mere foreign substance free to roll about and do damage by its migration.

The manner in which balls for ball bearings are made illustrates exactly what happens when an excess of a component in granular or crystalline form is entrapped in the eutectic of a metal serving for a bearing. The balls for ball bearings are put in a barrel together with oil and emery and the barrel is tilted out of a vertical plane and rotated on a pivot pin by a suitable means. The result is the balls are reduced in size and become true spheres by the continual grinding of one by the other, and were the process to continue, the balls would ultimately reduce to microscopic dimensions, but they would be spherical.

If, however, glue were to be substituted for oil and emery, there would at once be an arrest of the process. The balls would not rotate relatively and the wear would cease. This is what holds when the bearing metal is a satisfied chemical combination and the freezing process is entirely eutectic, whereas, on the other hand, a mixture not entirely eutectic holds unbound granules or crystals and they do the damage in two ways, i.e., the migrating granules set up wear and induce heat. Of course, trouble follows a condition of this sort, if the work to be done by the bearing is enough to produce relative motion of the free—not bounded—crystals or granules as the case may be.

## The Use and Utility of Dissimilar Metals.

To look at the question of bearings from still another point of vantage may result in some enlightenment, as, for illustration, it is the practice to either use two dissimilar metals, or hardened steel on steel. Why? It may not be so easy to set down the theoretical structure for these facts and yet a theory is but a statement of a fact. To begin with, like things have a common affinity, but since this is not desired in a bearing, unlike things are used. So far so good; but, hardened steel on steel works and on that account apparently contradicts the first contention. Hardened steel is a product in which the surfaces, to a considerable depth, are into a state of wear saturation of combined carbon. Either member then in a bearing, if both are hardened, has to give up and the affinity, as it were, is destroyed. On the other hand, if one member is soft and the other member is hard, the soft steel member will absorb carbon from the hard steel surface in contact, if the heat raises, and the end will be trouble because the hard member will be rendered soft and the affinity will be reestablished.

At any rate, there is every reason to believe that the molecular or microscopic structure of bearing metal has much to do with the efficiency of the product and no doubt the product that freezes under entirely eutectic conditions is the product of use for bearings. This fact is adequately established in still another way, as for illustration, it is established that a crystallized spindle cannot be made to run cool in the very journal it may have run in for years. The crystalline structure defeats anti-friction conditions because detached crystals roll relatively and set up heat.

The question of anti-friction can, in a large measure, if not entirely, be looked upon as a question of micro-structure of a given alloy, although it may be quite true that the coefficient of friction will be different for the different alloys. To clear the matter a little more, it is but necessary to say, no matter what the bearing material is, the angle in degrees on the "friction tester" will be the same, for all of them, if a certain grade of lubricating oil is used to lubricate all of them and the tempera-

\*Extract from "Part V," "Materials for Automobile Construction," by Thomas J. Fay, E.E. Published by the Class Journal Publishing Company, New York.

ture is the same during the several trials. This merely proves that all bearing metals will act the same provided the lubrication is effective and the question of anti-friction is of no account at all under such conditions, because it is the oil that does the work and the bearing merely serves to act as a sustaining member for the oil. It is important then that the metal be rigid enough to sustain the oil, hence the load, because the oil is pressed out by the load.

Looking at it in another way will tend to sustain this contention, *i. e.*, no matter what the anti-friction qualities may be, for any material extant, it is not claimed and it would be futile to claim that oil could be dispensed with. Experts who have given the question of babbitt metal the greatest attention claim that the best babbitt metal is that of the greatest tensile strength without any question, no matter what may be the anti-friction value of the product. This is but another way of saying, the metal with the most perfect chemical bond serves the purpose best, because it will be the most free from enmeshed foreign matter and the least likely to set up "intermolecular shear," which nomenclature the writer will have to "coin" to make his meaning plain.

**An Analysis of the Matter of Stresses.**

It is said that it matters not at all if the stresses are the result of a "sliding friction" or the product of a "dead pull," and it is easy to see why this is so, for it cannot matter how the thing transpires so long as it does transpire. On the other hand, it is not so easy to show how sliding friction can put stresses in the metal of the bearing, but the stresses are present and they can be figured out as follows:

$$J = \frac{\pi d^4}{32} = \left\{ \begin{array}{l} \text{Polar moment of inertia of the section} \\ \text{with respect to the axis.} \end{array} \right.$$

$$C = \frac{1}{2}d = \text{distance of the most remote fiber from axis in inches.}$$

$$P a = \frac{S J}{C} = \frac{\pi d^4 S}{16 \cdot 5.1} = \frac{d^4 S}{5.1} = 0.1963 d^4 S$$

$$d = \sqrt[3]{\frac{5.1 P a}{S}} = \text{Diameter of the member.}$$

$$P a = \left\{ \begin{array}{l} \text{Pull in pounds at a distance (a) in inches} \\ \text{from the axis may be described as the} \\ \text{moment of the applied force in inch pounds.} \end{array} \right.$$

$$S = \left\{ \begin{array}{l} \text{Unit shearing resistance of the material} \\ \text{in pounds per square inch.} \end{array} \right.$$

All the above holds for a bearing of a given diameter if it is solid and round, but the journal box outside of the spindle is hollow and a different condition obtains. For such a case the formula should read as follows:

$$P a = 0.1963 \frac{d^4 - d_1^4}{d} S = \text{as before,}$$

and

$$d = \sqrt[3]{\frac{5.1 P a}{S \left\{ 1 - \frac{d_1^4}{d^4} \right\}}} = \text{as before.}$$

These formulas are mere adaptations of the conventional torsional formula and must apply perfectly for the purpose, only it is not quite so easy to fix upon the value of *P*, the pull in pounds due to friction, although it can be measured on a dynamometer. The distance (*a*) is any distance of the applied force, and in this case would be equal to (*c*), and (*c*), as before stated, is half the diameter or the radius of the bearing.

It is plain that *S*, the maximum torsional shearing ability of the metal, is most favorable if high, and, from what the formulæ say, the claim of high tensile strength as being a desirable requisite is borne out because high tensile strength denotes high shearing resistance.

Besides the resistance to shear, the resistance to heat is taken into account in bearings and this property is expressed as the relative degrees of heat required to overcome molecular tension, considering the various metals. The crushing strength of the metal is also a factor, and it is said that the pressure in any case

should not exceed the square root of the crushing strength of the metal used. In considering the white alloys at any rate (the so-called babbitt products), their resistance to crushing, elastic limit and tensile strength all decrease as the temperature increases. This is rather disconcerting, and it looks as if a bearing can get into trouble without much effort and they generally do.

The anti-friction properties of metals are measured in a very simple way, *i. e.*, a polished steel plate is placed in a position to be tilted and a polished cube, of the metal to be investigated, is placed thereon. The plate is tilted until the unlubricated cube slides down the polished surface of the plate and the angle is noted. This is all very simple and serves the purpose perfectly, but with a film of oil, as before stated, all metals slide down the way with scarcely no difference of the angle. Therefore, to repeat, anti-friction qualities are secondary.

SUBJECT: BEARING METAL  
 NUMBER: XXI MARK: F.H.  
 NEW YORK, 4-7-07

CRUSHING STRENGTH 88500 POUNDS PER SQUARE INCH  
 MOLECULAR TEMPERATURE 1000° FAHRENHEIT.  
 ANTI FRICTION ANGLE 77°  
 OF THIS METAL THE AUTHOR HAS USED ENOUGH FOR ABOUT 150 CRANKSHAFTS MAKING ABOUT 1050 BEARINGS WITH GOOD RESULTS IN THE S. & M. SIMPLEX MOTORS.

IN CASTING IT SHOULD BE COVERED WITH CHARCOAL AND HEATED TO A DULL RED BEFORE "TEEMING".

There is one other phase of this bearing question that ought to have more attention, *i. e.*, no matter what may be the material of which bearings are made, they will not serve at all, especially in crankshaft work, unless they are carefully scraped to a full bearing.

Taking this fact into account and the further fact that with oil all metals have the same friction—the friction of the oil—and allowing for the fact that no metal will serve without oil, it looks as if hardened and ground steel bushings accurately fitted, with due allowance for the oil film, would serve even better than any white metal that can be devised. The hardened and ground steel bushing on hardened and ground spindles or pins, copiously lubricated, answers every theoretical requirement better by far than any white metal.

These bushings are now used to a limited extent and they work admirably where they are employed, and it would be no great surprise if they held out under conditions of service that would not be possible with any babbitt metal ever devised.

Besides white metal and hardened steel, other products are used as phosphor bronze. This product consists essentially of a copper-tin entectic and differs from the best white metals in that they are tin-copper. In the phosphor bronze the copper is the major portion, whereas, in the white metal the copper is the minor portion.

The property of the phosphorus is to deoxidize the copper and compact the micro-structure, but beyond this the phosphorus serves not at all.

PHOSPHOR BRONZE.

Reduction	.....
	H 6.33
Rating	.....
	H 75.68

This product is used for "armor" brasses into which the tin-copper white metal is run to serve as the anti-friction facing.

In this way the strength of the phosphor bronze is preserved, while the good qualities of the white metal are utilized.

See XXIII.

There are advocates of the three components—ternary-alloys are best, but all seem to agree that more than three components are undesirable. At all events lead and zinc are not desirable for any high speed bearing work, and if three components are used they should be copper, tin and antimony, much the same as genuine babbitt.

Edward R. Hewitt, in some of his work, proceeded as follows and realized most promising results: He melted good commercial babbitt in an iron pot and "salted" it with pure tin until it became "cold short." This excess tin imparted the desired rigidity and altered the molecular temperature point to a marked extent.

While it is not possible to say just what the other components were, the fact remains that the doctoring or "salting" process netted good results and more likely than not the end was a tin-copper antimony product, in which the right proportions were found by "rule of thumb." The writer has used this process and found no ill-effects from the use of the product. Indeed, products of this making worked exceedingly well in motor crankshaft bearings, but the white metal so made was backed up by phosphor bronze "brasses."

From what has been said it will be observed that an inferior babbitt will be more or less brought within reach of an acceptable standard by remelting the babbitt and adding pure tin up to the limit of the tin carrying capacity of the product. It will be known when this point arrives by trying the product from time to time until it breaks on bending. In other words, the tin added tends to render the product "cold short." This process can be carried too far, but to do so is wholly unnecessary, because it is easy to see when the metal is short enough.

Alloy Metals and Their Characteristics.

Tin is an especially desirable content in a bearing metal for one other reason besides the fact that it engenders rigidity, because tin is non-corrosive and a large tin content renders the whole immune from corrosive influences. While it is true the oil to use is that free from corrosive tendencies, yet even so it is hard to tell just what oil will do until the damage is manifest. Tin then in excess amounts to insurance as against the ills of corrosive oil.

In the production of bearing alloys in which copper is a component there is more or less difficulty involved because of the high melting point of the copper as compared with the remaining components. With copper the possibility of using a little nickel to lower the facing point has been considered and taken advantage of. The presence of the nickel is no detriment to the bearing metal, anyway a very small increment of tin serves the purpose, *i. e.*, 1 to 2 per cent. After the copper is molten, tin can be added in large percentages as required, and following tin lead will incorporate and cement readily. Lead is a softener, just the reverse to tin, which may be classed as an intensifier. It follows, therefore, that an excess of tin may be offset by the addition of lead, or an excess of lead will be corrected by the addition of tin.

Lead is a fairly satisfactory component since it possesses last-mentioned quantities, although its friction coefficient is a little high.

Antimony is not a good metal for bearings because it has not the requisite wearing qualities, but it does harden the alloy, and when it is present the object sought is hardness. Excesses of antimony result in an open crystalline structure. Zinc, on the other hand, is merely a cheaper and should be found in low-priced products to the exclusion of tin. This sort of a thing is quite to be tolerated, if bearings are not required to do hard work; but zinc in the bearing alloy for motor bearings is not quite the thing.

Bismuth is valuable because it tends to reduce friction, assuming the quality is worth anything in a copiously oiled bearing. On the other hand, the bad qualities of bearing alloys as a rule are not traceable to the absence of bismuth, the presence of zinc or anything of that sort, but to the use of "junk." Junk will

not produce good bearing metal nor will a mixture of junk and good metal evolve good bearing alloys. What is wanted for good bearing alloys is all good pure metal, and even in the absence of a degree of skill fair success follows the use of good materials, whereas no amount of skill can produce the best results if junk is the foundation.

In general, the question of the skill required goes up enormously if the number of components to the alloy are many. The simplest alloy holds only two metals and there are enough, unless it is desired to use up junk. Indeed, that is the incentive for the use of more than three metals in a bearing alloy. The relative values of alloys should not be far from the following, assuming the use of new raw materials only:

RELATIVE VALUES.

1. Tin	Copper	
2. Tin	Copper	Antimony
3. Tin	Lead	Antimony
4. Copper	Lead	Antimony
5. Copper	Tin	Lead

Kent's Pocket Book, p. 33, quotes C. R. Dudley, Tour F. I., February and March, 1892, thus:

"Alloys are used as bearings in place of wrought iron, cast iron or steel, partly because wear and friction are believed to be more rapid when two metals of the same kind work together, partly because the soft metals are more easily worked and got into proper shape, and partly because it is desirable to use a soft metal which will take the wear, rather than a hard metal which will wear the journal more rapidly."

The *underscores* are by the writer with the idea of calling particular attention to the motives which can be put into other language just to see both sides. To begin with, it is said that soft metals are more easily worked, hence to use them makes the construction more easy. This is not to say soft metals are the best bearings, and again, soft metals will take the wear, but this does not say soft metals will make the best bearings.

So many of the old ideas have failed when they were applied to automobile construction that it would be no great surprise to discover that the soft metal idea is a fallacy as well; that is to say, in automobile work, with its high speed and low static pressure.

True, in crankshafts and connecting rods the bearings sustain a very heavy momentary load, but such loads are so instantaneous as not to press out the oil pad because the oil cannot be set in motion so quickly. In piston pins the instantaneous load may be as high as 1,200 pounds per square inch of projected area and no ill follows the use of hardened steel on steel. White metal would not do very well in this place, because white metal will not stand high temperature and high pressure as well, but for that matter none but the finest white metal mixtures will stand high pressure, and even then the pressure should be limited to the square root of the crushing strength of the metal.

In piston pin bearings phosphor bronze works if the bushings are very thin and backed up by steel in a most rigid way. The limit of thickness is about 3/32 inch, whereas, thicker bushing walls flatten and "run," leaving an elongated hole that soon declares itself.

Originally thin "brasses" were made for automobile work to reduce weight, but it was very quickly discovered they reduce wear, and this is a fortunate circumstance, for automobiles should be light.

Hardened steel on steel, to work nicely, should be "ground," allowing the proper bearing clearance as fixed in the "limits of tolerance" for the respective diameters; but in addition to being accurately "ground" the bearing should be worked in with "emery powder," beginning with a fairly coarse powder and ending with a comparatively fine product mixed with oil.

No attempt should be made to obtain a polished surface, for that would defeat the aim, because the emery, if the grinding process, if properly conducted, makes up a set of surfaces full of parallel grooves in which the grooves on the journal are in just position to the grooves on the hardened shell. When the bearings are so ground in, all large inequalities of surface are reduced

and the vast number of oil channels cut by the emery render it impossible to squeeze out more than the excess of oil, while enough oil remains in the grooves to satisfy the demand.

Mr. C. W. Hunt, who has given such a vast amount of attention, made it a practice to grind the shafts and spindles (of the engines and machines of various classes built by the C. W. Hunt Company) excepting at the bearings. The journals were left with the tool-marks on them, and Mr. Hunt claimed that to grind the journals was to render them unfit for arduous service. The writer served as "Executive Engineer" of this company for a considerable time, and had ample opportunity to note the results, and it is an assured fact that a bearing in trouble on a machine of any sort built by the C. W. Hunt Company is a most unusual occurrence. This plan of leaving the tool-marks is on the same principle as grinding in with "emery," but the emery is superior because it produces a vast number of very small grooves, not only on the journal, but on the shell.

The question of the loss of power in motors and transmissions is a matter that must in the long run become alive. Up to the present time (1907) most designers were wont to content themselves if only motors would run and cars would endure. Whatever troubles bearings in general are heir to, these troubles are intensified in automobile work for diverse reasons, as follows:

- (a) The machinery platform is unstable.
- (b) The rotation of the moving parts is not a constant speed.
- (c) The angular velocity is oftentimes very high.
- (d) The pressure on the projected area of bearings is variable and extreme.
- (e) The bearings are not rigid.
- (f) All kinds of foreign substances are likely to sift into the bearings.
- (g) The oil is not changed regularly, and frequently holds grit in suspension.

In general, then, bearings are hard to make and be sure of endurance, to say nothing of the question of the losses, but, as before stated, this matter must ultimately be given a due measure of attention.

Just what the distribution of losses is must depend upon the individual cars, nor can it be claimed that two cars of the same size and make would have the same efficiency of the transmission because the condition cannot be held a constant value.

In general the matter can be set down by way of a set of approximations, and as cars are perfected the approximate values will slowly advance in the direction of perfection. At the present time, for a plain bearing car, the distribution of losses will approximate as follows:

DISTRIBUTION OF LOSSES.

(Total power—100)

Delivered by motor.....	85
Delivered by clutch.....	83.3
Delivered by gear system.....	69
Delivered by sprocket chains.....	64.86
Delivered by wheel hubs.....	59.67
Delivered by tires to road.....	56.69

In thus lumping losses, it must be remembered that losses are due to many causes besides the bearing losses, and it would be a fallacy to assume that ball bearings for illustration would correct the major portion of this evil.

(This is for a direct on the high gear drive.)

(The indirect will have a different loss.)

To show that the question of losses is quite beyond the question of bearings only, it is but necessary to point out that the movement set up in the chassis springs is at the expense of power delivered by the motor or the friction in the distance rod joints sums up as a loss of motor power and so on. Indeed, every motion, every noise and every movement takes power, which to prove is very simple, as, for illustration, stop the motor and the noise, the motion and losses stop also.

## AUTOMOBILE VERSUS HORSE DELIVERY

UNDOUBTEDLY the chief factor which deters the average small house from seriously considering commercial motor vehicles is reputed high cost, regarding which there appears to be an erroneous impression prevalent. To the tradesman or business house, whose delivery service is comparatively small, the first cost of a motor vehicle appears high as compared with that of horses, while his ignorance as to the expense of maintaining such an outfit does not place the latter in a favorable light. As a matter of fact, reliable data concerning automobile delivery as an investment compared with horses is difficult to obtain, so that it is not to be wondered at that the average business man knows so little of the subject and is inclined to be skeptical.

The following data has been compiled by the Logan Construction Company, Chillicothe, O., from a number of sources, as well as from their own experience with commercial motor vehicles, so that it may be taken as applicable to similar cases in almost any part of the country, though the figures given for horse maintenance will be found low in large cities. The figures representing the initial outlay will also be found very conservative. They are as follows:

Wagon .....	\$150
Horse .....	150
Harness .....	25
	<hr/>
	\$325
Stabling and shoeing, per month.....	\$20
Driver's wages .....	60
Repairs, replacements, etc.....	5
	<hr/>
	\$85

Thus a house which requires three horses and wagons to handle its deliveries, has in them an investment of \$975, and a monthly charge for upkeep of \$255. But horses must be laid off at intervals, not to mention incapacity from sickness, so that it requires 1 1-2 to 2 horses to keep a one-horse wagon on the road all the time. At a conservative estimate, it may be said that four horses are necessary to run three wagons. This brings the

investment up to \$1,125 and raises the charge for maintenance to \$275. As compared with the foregoing, statistics compiled from a number of sources show the expense of maintaining a light automobile delivery as follows:

COST OF CAR COMPLETE, \$1,000.	
Gasoline and oil, per month.....	\$12.50
Driver's wages .....	60.00
Repairs, replacements, etc.....	2.00
Tire depreciation .....	5.00
	<hr/>
	\$79.50

With proper care, the single automobile delivery wagon is the equivalent of the three single-horse wagons, so that there is a saving of \$125 on the investment at the outset, while a comparison of the cost of maintenance of the two reveals a difference in favor of the automobile delivery amounting to \$195 per month, or a total of \$2,346 yearly. To place matters on an even more conservative basis, it may be assumed that the automobile is only capable of doing the work of two single-horse wagons instead of three, in which case its superiority in cost of maintenance would still amount to \$110.50 per month.

The price of \$1,000 is that of a light two-cylinder car for average delivery work, some of the figures having been compiled from the service rendered in the case of bakers. Larger cars with greater carrying capacity and higher speeds are sold at \$1,500 and \$1,800, at which figures they compare very favorably with the expense of maintaining sufficient horse equipment to perform the same service. One of the chief points on which the average business man is ignorant is with regard to the expense of a driver. The makers of such cars have made them as simple as it is possible to do so and neither an expert technical man nor a skilled mechanic is necessary to run them. They must be given the care required by any piece of machinery, as their reliability depends not so much on the ability of the driver to repair broken parts as it does in giving proper care and attention at the right time which will prevent such accidents.

### PRACTICAL GEAR CUTTING IN AUTO WORK.

The development of the automobile industry and the use of high-speed gears have developed new conditions and new problems in the manufacture of gearing in general, says *The Mechanical World*. Perhaps a person directly engaged in the commercial manufacturing of gears of many sizes and kinds appreciates this situation better than the average man in mechanical pursuits. It is my purpose, therefore, to treat briefly of a few of these practical points in connection with gear-making and to show the tendency of the art. The degree of accuracy required for most gears to-day is much greater than it was a few years ago. The increased perfection in building many lines of machinery has had its influence, as well as the advance of the automobile industry. The high-grade motor car demands gearing which shall run at a very high speed, under severe conditions of loading and shocks, and as noiselessly as possible. To meet these conditions, accurate gears are required. While we have been able to meet these conditions with quite a degree of success, I am looking for still greater accuracy and still greater perfection in manufacturing gears in the near future. A high-grade gear should be accurate not only as regards the teeth, but as regards all its other elements. The hole should be true and of proper size. The keyways should be of the proper dimensions and accurately located. The blanks should be turned true and of exactly the right diameter. These details are sometimes overlooked or slighted even in gears which are supposed to be of high grade. It is absurd to demand high-class cutting on a poorly-machined blank. Yet this is the condition which the gear manufacturer sometimes meets with.

### IMPROVED ROADS AND THE AUTOMOBILE.

An event of a certain amount of importance in connection with the use of motor cars relates to the trials made during May on certain roads in Middlesex and Berkshire with preparations of tar and tar-spreading machines for the prevention of dust, says *The Mechanical World*. It appears that the judges' committee of the Roads Improvement Association have just made the awards of prizes for the machines which they consider to occupy the first and second positions, and also for the two best tar preparations, due regard being had to the condition of the roads since the tests were made on four days in May. As the committee consists of eight leading engineers and road surveyors in addition to members of the Association, it will be necessary to attach importance to their report on its forthcoming publication. At the same time it has to be borne in mind that the trials have been made in the interest of the motor car industry, and the real object is to secure improved road surfaces for the purpose of obtaining higher speeds with automobiles. But how would this work out in practice on the assumption that prospective legislation would abolish the existing speed limit, and that the roads were covered with a dust-preventing composition? Surely the answer is to be found in the experience already gained on the Brooklands racing track, where the cement surface not only gave way during recent racing, but the concrete foundation was disintegrated and thrown about the track. If this is possible with cement and concrete, the question is whether the ordinary roads would behave any differently when tar-covered and when autos were traveling on them at only half the speed attained on the racing track in question.

## LETTERS INTERESTING AND INSTRUCTIVE

### EISEMANN SYSTEM AS USED ON A PACKARD.

Editor THE AUTOMOBILE:

[901.]—Will you kindly publish in the next issue of "The Automobile," under the head of "Letters Interesting and Instructive," a wiring diagram of the Eisemann high-tension system of ignition as employed on the Packard car?

FRANK AVERY.

Kalamazoo, Mich.

As employed on the Packard car, the Eisemann magneto is interconnected with a second system utilizing a set of accumulators as a source of current supply. That is, when working, the magneto operates as a self-contained system, but the same set of spark plugs and the magneto distributor are utilized, as the components of the second system already referred to. The non-vibrator coil of the magneto is carried in a case on the dash which also houses a single vibrator coil for the battery side of the system. The current from the accumulators passes through a low-tension timer of the usual type to the single vibrator coil, thence through the magneto distributor, which is turning whether the magneto is working or not, to the plugs. This is shown by the accompanying diagram, which, however, does not illustrate the inside connections of the magneto itself. One side of the armature winding is grounded; the other is carried to the terminal *Mg* on the under side of the coil box; one side of the secondary is also grounded, while the other, electrically connected to the moving member of the distributor on the magneto, is carried to the terminal shown on the coil box by concentric circles from the central terminal shown on top of the magneto distributor, the

SKETCH SHOWING PACKARD SYSTEM OF WIRING.

other four being taken to the plugs. When working on the magneto the non-vibrator coil in the case is in action, while the battery operates the vibrating coil in the same case, the terminal *P* being its primary, and *M* signifying *masse*, the French for ground connection, one side of the secondary of this coil also being grounded as usual.

### REGARDING PUBLICATIONS OF A. S. M. E.

Editor THE AUTOMOBILE:

[902.]—Inquiries recently received show that your readers are not aware that the publications of the American Society of Mechanical Engineers are for sale to the general public, and further, that none of its publications is copyrighted.

The second edition of "The Art of Cutting Metals" was brought out to fill orders for Proceedings, Volume 28, No. 3, which was almost immediately exhausted after the annual meeting. So great was the interest aroused that we expect to go to press a third time with this paper early in the fall.

To correct the above mentioned misapprehension we will appreciate your making note of this in your next edition.

THE AMERICAN SOCIETY OF MECHANICAL ENGINEERS,

29 West 39th St., New York City.

E. S. Whitaker.

### ABOUT THE USE OF OXYGEN AND ACETYLENE.

Editor THE AUTOMOBILE:

[903.]—I have a Packard "30," and would like to have some light on a few things that perplex me.

1. Granted that the oxygen in the air is the active agent which combines with the gasoline vapor in the explosion, would it not be an enormous gain in power to provide a tank of oxygen just in front of the auxiliary air intake? Even if much of the gas thus escaping from the tank did not enter, would not the fact that the air thus inhaled was more or less diluted with pure oxygen in excess of its normal content, give a great increase of explosive power?

2. Or, how would it do to provide a supply of peroxide of hydrogen ( $H_2O_2$ ), which gives off its oxygen, leaving water behind, contained in an atomizer just above the air valve of the carbureter, and spray the surrounding air with its vapor? Would the water thus given off, together with the oxygen, have any worse effect than the atmosphere on a rainy day?

3. Would there be any gain or loss of power if the contents of a Prest-O-Lite tank were allowed to escape under the hood, thereby compelling the carbureter to mix acetylene gas with the usual mixture?

4. On a car having a chain drive, taking the gear ratio as being 3 to 1, would it not be a saving of power to have both sprockets as

FIG. 1.

FIG. 2.

large as possible? Is there not more energy wasted in pulling the tooth on Fig. 1 than on Fig. 2? In other words, is not the lever in the sprocket of greater radius much longer, thus making the pull lighter?

AL. EISEMANN.

New York City.

1. The addition of oxygen in the proper proportions would naturally give a more powerful explosion than obtainable with its more dilute form as in the shape of air. In fact, there has been considerable controversy over the use of oxygen by racing cars on the Brooklands track in England, as giving those who employ it an entirely unfair advantage over their competitors not thus equipped. The manner of employing it that you indicate would be extremely wasteful and probably not productive of much good. Its use entails the risk of producing so powerful an explosion that the motor will succumb to it, probably with disastrous consequences. Motors are not designed for the use of fuels other than those commonly employed, such as gasoline, kerosene, alcohol, under ordinary conditions, and the introduction of such a mixture might well produce an explosion far exceeding the motor's factor of safety. There are other things to be considered beside a mere increase in power. The average up-to-date automobile is already very much over-powered.

2. Your second question is open to the same objections. The method is wasteful and extremely uncertain, so that there would be imminent risk of the motor wrecking itself. The water combined with the oxygen would be no objection, could the quantity of either be properly regulated. The admission of a certain amount of moisture rather benefits the motor than otherwise, and numerous experiments have been made in water-injection just about the time of explosion.

3. This would be far more objectionable and likewise far more dangerous than either of the foregoing expedients suggested. There would be every possibility of the escaping acetylene gas combining in the proper proportions with the air under the hood to make an explosive mixture, which would sooner or later be fired with serious consequences. The latter are also to be expected of the introduction of an acetylene mixture into the cylinder as the explosion obtained with this gas is extremely powerful and not safe to employ in even the best built motor

designed for gasoline. The method of employing the gas would also be equally wasteful and uncertain. Running such a combination would be about equivalent to sitting over an open barrel of powder and dropping matches into it from a little height. Most of them would go out before reaching it, but sooner or later it would go off.

4. Within certain limits larger sprockets save power and make the running much smoother, regardless of the gear ratio, by compelling the links of the chain to bend round a circle of large diameter rather than of one of small diameter which would necessarily cramp them more or less, as well as introducing a great deal of unnecessary friction. The leverage is better distributed.

### ANOTHER NOVEL IGNITION SYSTEM.

Editor THE AUTOMOBILE:

[904.]—I have noticed the description of the new system of ignition being placed on the market as the "K-W" ignition, which employs what is known as a "master vibrator," but I have devised a system of ignition of my own which I think is superior. Instead of adding an extra coil and trembler to the four already in use on a four-cylinder engine, I see no reason why one coil and vibrator is not sufficient. I enclose a rough sketch from which you will see that the chief difference lies in the construction of the timer. The system, of course, requires the use of a magneto or dynamo as the primary current is not broken, as is the case with the ordinary timer in general use.

NOVEL IGNITION SYSTEM AS OUTLINED BY MR. BROWN.

To explain the sketch, the rollers C and D and their connecting link G, are insulated from the engine frame. The timer has the usual outside contact points corresponding to the spark plugs, but it also has an inside collector ring F, insulated from the engine frame, and stationary. The rollers C and D form an electrical connection between the ring F and the segments of the timer. Means are provided for rotating A at the speed of a camshaft and for holding C and D in their relative positions.

Will you kindly give me your opinion of this ignition system and state the objections you think it may have? DAVID L. BROWN.  
Otto, N. Y.

There are numerous objections to your proposed system of ignition which have been sufficient to condemn its use when tried in the past—that is, its fundamental requirement of employing a continuous current. This needs a direct-current generator or a magneto which is run continuously at such a speed that its output will be of practically a uniform intensity. That is, its periodicity must be so high, such as the 60 or 125 cycle alternating current used for incandescent lighting, that there will be no interval of excessive drop in the current value at any particular point, as should the latter coincide with the time of contact the plug connected with the latter would not spark. The type of magneto generally utilized for automobile ignition does not produce such a current, but is usually synchronized with the motor and only produces a current impulse at a point corresponding to the time of firing in each cylinder. To do this, its armature is usually short-circuited upon itself and only opened twice per revolution in the

case of a four-cylinder engine. The details of the various systems of magneto ignition differ considerably, but they are all based on synchronism and could not be employed for such a system as you contemplate.

The objection to the use of a magneto generating constantly, such as that previously referred to, is the same as that attaching to the use of the direct-current generator. Its speed must not alone be high, but it must be, as nearly as possible, uniform. A governor is required to prevent exceeding a set maximum, while any excessive drop such as frequently occurs in the speed of an automobile engine puts the whole system out of commission, as its mainstay—the generator—no longer produces sufficient current to operate it. Moreover, a trembler coil of the usual type would never operate satisfactorily with a current of such constantly fluctuating value. The slightest hesitation of the governor to function properly would sooner or later result in the destruction of the coil, while subjecting it to continuous use would be productive of endless trouble with the trembler. These are a few objections that strike us at first sight; doubtless those who have tried similar systems in earlier days can recall others.

### MANAGEMENT OF SPARK AND THROTTLE.

Editor THE AUTOMOBILE:

[905.]—1. With car standing, ignition system O. K., spark retarded and throttle closed, the engine occasionally misfire. I am told that this is not an infrequent occurrence, and that, so long as there is regular firing at higher speeds and under load, this misfiring has no significance. I wonder whether this is correct. Does it not indicate either that the carburetor is not, or that it cannot be, accurately adjusted for the best service?

2. In adjusting a carburetor and the spark lever for the minimum service (i.e., spark retarded and throttle closed), is there any general rule as to the number of revolutions of the motor under these conditions? Should the adjustment under these conditions be such that the motor runs "as slowly as possible?" Or, assuming the maximum speed of the motor to be ... r. p. m., what should be the minimum?

3. Should the minimum adjustment as in No. 2, for best general results, be such that the motor will do some work under load? For instance, should the adjustment be such as to enable the motor to move the car on the level at minimum speed? Or is it better to figure on the motor doing no actual work except with some advancement of the spark or some opening of throttle?

4. Instructions are given, on the one hand, that the preferable operating practice is to run with advanced spark rather than with opened throttle and late spark; and, on the other hand, we are told, and we often find, that misfiring results from first advancing the spark and later opening the throttle, but not if the throttle leads and the spark follows. So much depends upon the proper manipulation of spark and throttle that I would like light upon this. If there is a general rule applicable to all gasoline motors I would like to know it, and try to work to it. If each motor and outfit must be treated as an independent proposition in this respect, I would like to know that.

5. Automobile makers often hold out the idea that a touring car will run twenty miles or more on a gallon of gasoline. I read of operators who claim to do 50 per cent. better than this. Working in the hills and using the lower speeds a great part of the time, I very often seem to get no more than eight to ten miles per gallon. When I try to work with less throttle I lose power. The question with me is not so much the cost of the gasoline, as whether I am awkwardly opening too much and getting my engines too hot. I do not know how much heating is normal when running in the hills. Water in my radiator, thermosiphon system, often boils in this work. Can you help me out on this? If so, doubtless there are others who also will benefit by it.  
TENDERFOOT.  
Cambridge, Ohio.

As you say, this is a more or less frequent occurrence, but nevertheless it should not be. The motor should run regularly at as low a speed as it can be throttled down to, though with some carburetors it is found impossible to obtain satisfactory service at higher speeds, if adjustments be made to have the motor run without misfiring at very low speeds. In other words, the carburetor's range of adjustment is not co-extensive with that of the motor's speed range. Such cases would seem to be rare nowadays, however, and doubtless the majority of them could be remedied. It is customary in adjusting a carburetor to a motor

to set it so that it will run the latter regularly at as low a speed as possible, subsequently modifying the adjustment in order to obtain similarly good results at high speeds and under load. The adjustment need not be a great deal out of the way to cause this misfiring at low speeds, as it will readily be evident that a slight excess opening of the gasoline nozzle that would not be particularly noticeable at higher speeds when the auxiliary air-valve was also open, might pass entirely too much fuel for low speeds, as a motor will misfire on an over-rich mixture as on a very lean mixture; in fact, the case can be reversed, the extra suction of the engine at high speed drawing sufficient gasoline, and not enough when throttled down.

2. Not that we know of. It is customary to adjust the carbureter to run the motor as slowly as it can be made to do so without misfiring. As you do not supply any figure for your assumption we do not know what you had in mind, but, taking 1,500, which is probably a usual maximum speed for automobile motors having a normal speed of 1,000 r.p.m., the minimum would be about 300 r.p.m., maybe less in some cases, but not a great deal, and higher than this in a great many.

3. This adjustment is very frequently made so that the motor will move the car on a smooth, level surface, such as a garage floor, with little or no opening of the throttle. But by "this adjustment" we do not refer to that of the carbureter nozzle, but to the opening of the throttle. The latter will be found to have a stop in the majority of cases, which prevents its entire closing, and this stop is usually set to give the engine sufficient fuel to move the car on the level. As already referred to, the nozzle adjustment is usually made to run the engine at its minimum.

4. The better practice is, as you say, with advanced spark and half-closed throttle, rather than otherwise, as under such conditions the fuel is burned to much better advantage. Misfiring results from advancing the spark without opening the throttle, as the motor literally runs away from its fuel, *i.e.*, it speeds up as the result of advancing the spark and cannot then draw sufficient fuel through the restricted opening. It is good practise to either open the throttle and follow with the spark, or advance both simultaneously, as some drivers do. With magneto ignition, now very general, the spark lever position is not disturbed much, except for starting, control being entirely by throttle. This is coming to be very general practise. To a certain extent, each motor is a law unto itself and its peculiarities must be learned, otherwise general rules apply.

5. "Touring car" is too indefinite. There are thousands of touring cars which never do 15 miles on a gallon of gasoline even under the most favorable circumstances, owing to the great size of their motors, weight of the car, and the like, and many do not go much above 10 miles to the gallon. In hilly districts or heavy roads this would be less. The skill of the driver plays an important part in fuel consumption. An 18-20-horsepower car, in good condition, and under favorable circumstances, should average about 20 miles to the gallon, but frequently will not do this owing to poor adjustments. The question is not one of throttling alone; tight or poorly aligned bearings anywhere on the car will cause a great loss of power. As the size of the motor decreases, the mileage per gallon increases, single-cylinder motorcycles doing as high as 90 miles or more to the gallon. Given good conditions, it is simply a question of engine size and car weight. The fact that you are using so much gasoline and that the water boils, would seem to indicate an excessive opening of the spray nozzle, giving too rich a mixture.

#### OVERHEATING IN ENGINE AND GEARCASE.

Editor THE AUTOMOBILE:

[906.]—Will you kindly tell me through "Letters Interesting and Instructive" how to clean my radiator? My engine overheats quickly and I find the water in the tank has a very rusty appearance. Am not sure that the cooling system is at fault, but probably matters will be improved if I clean out the radiator. Why does my gearcase

(planetary) overheat? I find it difficult to keep grease in same. The bands are not dragging, yet the case gets hot. C. G. MOORE.  
Sharon, Pa.

It is not altogether certain from the few particulars you give that faulty water circulation is the cause of your engine overheating. It may be that, through neglect in filtering, foreign matter has been allowed to enter the radiator and one of the tubes is choked. This can be removed by sending a strong flow of water through the radiator by means of a powerful pump. If incrustations have formed on the tubes or the radiator is greasy, it should be washed out with an acid solution, being thoroughly flushed with water afterwards to remove all trace of the acid. Details of how to do this have frequently been given in THE AUTOMOBILE; in last week's issue one correspondent tells of a preparation he used with success to clean out a defective radiator. While you are doing this work it would be wise to verify the working of your pump. It may be that you are simply running on too rich a mixture and will find that a simple carbureter adjustment will remedy matters.

By opening out your gearcase you will doubtless at once discover the cause of overheating and the remedy will be apparent. You do not give any particulars, but we should imagine that, possibly through neglect, one or more of the pinions are not running freely on the studs. Are you sure that you are using the right kind of grease, and that proper attention has been given to lubrication?

#### LONG TRIP ON KEROSENE AND GASOLINE.

Editor THE AUTOMOBILE:

[907.]—As an experiment, myself and my two sons recently undertook a tour in which we relied entirely upon a mixture of two fuels, kerosene and gasoline, in the proportion of 3-4 of the latter to 1-4 of the former. The car is a four-cylinder, air-cooled machine, and we averaged 15 miles to the gallon throughout the distance, of about 500 miles, which is good going for the roads to be found through Indiana and Ohio, over which we traveled. We found that there seemed to be less heat, less vibration, better lubrication, and apparently more power. In fact, we have been so pleased with the outcome of the experiment that we have no doubt there are many readers of "The Automobile" who would like to learn of it.

Columbus, Ohio.

CHARLES L. BELL.

#### SOMETHING FURTHER ABOUT THAT GREASE.

Editor THE AUTOMOBILE:

[908.]—In reply to a letter of inquiry (No. 887) about gear case compound, signed C. S. Welmer, printed in your issue of September 5, I am quoted as saying that I used Albany grease on the Locomobile racer in 1905. While this statement of itself is correct, yet, taken in connection with the inquiry of Mr. Welmer, it is misleading. Albany grease was used on the machine only for lubricating the water pump shaft. The gear box was lubricated with Havemeyer Gear Compound, which proved thoroughly satisfactory for the purpose.

To prevent any misunderstanding on the part of the readers of your "Letters Interesting and Instructive," will you please publish this letter in your next issue?

New York City.

JOSEPH TRACY.

#### AT LAST ON THE RIGHT TRACK.

Editor THE AUTOMOBILE:

[909.]—Answering my own inquiry, No. 887, I desire to thank you for putting me on the track of the lubricant. The Havoline Oil Company have communicated with me, and they are the company from whom I can secure what I wish. I have sent them an order to-day.

For my own satisfaction I have hunted up the ad., which I remembered having seen in "The Automobile," and I found it in the Thursday, October 19, 1905, issue, on page 28, a full-page advertisement of the Havemeyer Oil Co.

Lebanon, Pa.

C. S. WEIMER.

There were 27,026 automobiles in use in Germany at the beginning of the present year. Of these Prussia alone had 16,084, and the province of Brandenburg, which includes Berlin, 4,028. Berlin itself had 1,976 cars registered.

MODEL J, 40-HORSEPOWER PULLMAN TOURING CAR, FULLY EQUIPPED.

WITHIN the past few years the automobile industry as a whole has become more or less sharply divided into two large classes of manufacturers; those who devote their entire attention to the construction of a single model, and those that find it more profitable to appeal to a wider range of buyers by presenting a line of models. An instance of the latter is to be found in the case of the York Motor Car Company, Inc., York, Pa., this firm planning to market a line of not less than five models during the season of 1908, two of which will be distinctive, while of the others one will be the runabout counterpart of the touring car type, one is a special six-cylinder roadster and the last a low-powered car. They will be known as Models I and J touring cars, and Models 4-40 and 6-30 runabouts, the fifth being a 20-horsepower car, the details of which are, as yet, not forthcoming.

The Yorke Pullman cars, as they are known, embody numerous distinctive features of design, which are, however, substantially reproduced in each of the different models, so that a description of the Model I, five-passenger, 40-horsepower touring car will suffice to give an idea of the construction of all. The motor is distinguished by the use of independent cylinders which, however, are cast with large rectangular flanged openings in the water jackets. When the motor is assembled these flanges are bolted together, thus combining the water jacketing of all four, insuring a uniform temperature. At the ends the jacket openings are covered by plates, as shown by the illustrations of the motor. This form of construction also has the advantage of anchoring the independent cylinder castings together firmly, thus minimizing vibration and rendering the motor much stronger as a whole, while still permitting the easy removal of any one of the cylinders. In fact, from the viewpoint of the user, it has all the advantages of a four-cylinder unit casting, with none of the latter's disadvantages. It also greatly simplifies the circulation piping as the water enters the rear cylinder jacket and progresses forward through all of them. Both cylinders and pistons are ground to .001 inch on an improved Heald cylinder grinder and a special piston grinding ma-

chine, the pistons being tapered from the lower ring to allow for expansion. Three compression rings and an oil ring are fitted, while an oil groove distributes the lubricant and oils the wrist pin.

The valves are oppositely disposed and mechanically operated; they are interchangeable and are die-forged from solid bars of nickel steel. The crankshaft is machined from a solid billet of high-grade steel and is offset from the cylinder centers, reducing the side thrust on the cylinder walls during the explosion stroke. Cramp's special bearing bronze is used for the wrist pins, and Parson's white brass for the main bearings. The connecting rods are I section drop forgings. The engine base is of an aluminum alloy of high tensile strength and carries the five main bearings. Four liberal-sized inspection plates are provided, while the casing for the timing gears is cast separately and bolted on. The bottom pan is also an aluminum casting and is divided into four oil compartments of the proper height, a sight gauge cast integral with the base serving to show the oil level.

A six-feed oiler takes care of the lubrication and is conveniently mounted on the dash, four of the feeds going directly to the cylinders, while the remaining two are branched to the five bearings and their surplus serves to maintain the level in the crankcase. The oppositely placed camshafts are also offset from the valve centers, reducing both the wear and noise to a minimum. The timing gears are of manganese bronze and of large diameter,

and have a center insert of hard fiber. Cooling water circulation is by means of a centrifugal pump situated directly back of the radiator and bolted to the I-beam supporting arm of the engine base. It is gear-driven at the same speed as the crankshaft and has a capacity of eight gallons per minute at a speed of 1,000 r. p. m. It receives the water directly from the radiator and delivers it through a single pipe to the jacket of the rear cylinder. The radiator itself is of the vertical, flat-tubed type, the tubes being separated and supported by horizontal fins; it is mounted directly on the cross girder of the frame and has no connection with the side members, thus avoiding destructive torsional stresses. The fan consists

THE PULLMAN AS SEEN FROM THE FRONT.

INTAKE SIDE OF 40-H.P. 4-CYLINDER PULLMAN MOTOR.

VIEW OF MOTOR AS SEEN FROM THE EXHAUST SIDE.

of a manganese bronze hub with sheet aluminum blades, the whole being mounted on adjustable ball bearings.

The ignition is of the high-tension type employing a single coil and combined timer and distributor. The coil is mounted on the dash, while the distributor is placed between the first and second cylinders, its bottom being flush with the top of the engine. It has but one adjustment and one contact for all four cylinders and runs in oil, being housed with a glass cover. The drive is by bevel gearing from the camshaft, the spindle running in bronze bearings and being lubricated from the splash in the crankcase. A set of six-volt, 60-ampere hour accumulators forms the current supply with a set of six dry cells as reserve.

A conical, leather-faced aluminum clutch is employed as the first step in the transmission of the power, the leverage of the clutch pedal being compounded so as to render its disengagement easy. It is interconnected with two automatic brakes, which bring the clutch to a stop and facilitate gear-changing without possibility of clashing. The gear set provides four forward speeds and reverse, the direct drive being on the third with the reverse idle on all the forward speeds. Shifting is on the selective plan, a movement of the lever to the right or left picking up one of the shifting levers and automatically locking the remainder. Both the pinions and their shafts are of chrome-nickel steel, the latter being supported on imported ball bearings of the non-adjustable type and the whole running in oil. The housing is of cast aluminum supported by four integral arms carried on the pressed steel sub-frame. A universal is interposed between the gear set and clutch, while two more universal joints are embodied in the cardan shaft; all are automatically lubricated and thoroughly protected from water, dust and dirt.

The rear axle is of the floating type fitted with adjustable Timken roller bearings throughout, the taper of the latter taking care of the side thrusts of the gears as well as the weight of the load.

The driving shafts are one and one-half inches in diameter and are squared at the differential end, thus permitting of their withdrawal without removing the axle, and also making the gears and bearings accessible. The inner Timken bearings take all the side thrust of the bevels and provision is made for the adjustment of the latter by small plates lo-

cated in the housing, made accessible by the removal of a single bolt. The axle is trussed under center of differential housing.

The front axle is one-piece forging of chrome nickel-steel, the steering knuckles being fitted with roller bearings. The frame is of the standard channel section, pressed steel type, carried on 41 by 2 1-4 inch semi-elliptic springs forward, direct connected in front and suspended by plates at the rear, and on a three-point platform spring suspension at the rear; the springs are clipped at the third leaf, each leaf having aligning flanges. The running gear consists of 34-inch wheels, fitted with quick detachable rims to take any standard American tires, the front being 34 by 4 and the rear 34 by 4 1-2.

A double set of internal expanding and external contracting brakes housed in drums on the rear wheel provide for this important essential. The steering gear is of the screw type with ball bearing cone to take up lost motion. The steering gear is mounted on one of the I-beam arms of the engine case and is suspended by a bearing on the dash. The latter is an aluminum casting curved at top and sides and is bolted directly to the frame. The wheelbase is 118 inches and the tread 56 inches. The bodies are of wood and are made complete in the home plant. With complete equipment, the Model I lists at \$3,250. The chassis of the Model J is identical, but the motor is equipped with a magneto, having two separate ignition systems, even to the plugs. The body has an unusually large tonneau fitted with two comfortable extra folding and revolving seats, and the car has, in addition to its ordinary equipment, a lined cape top, with side curtains, and a folding glass front. It lists at \$3,750. The Model 4-40 runabout is built on the same chassis as the foregoing with a three-speed gear set, has 108-inch wheelbase and carries a magneto as regular equipment. The weight is about 2,400 pounds, and the selling price is \$3,000. Model 6-30 runabout is a special 30-horsepower six-cylinder roadster having smaller cylinders. The

wheelbase is 104 inches and it is lighter throughout. It carries a magneto as regular equipment and lists at \$2,750.

Thus, ranging up from a 20-horsepower four-cylinder car to a 40-horsepower touring automobile, the York Motor Car Company obtains five models, with which they can appeal to a wide range of present and prospective users.

SIX-CYLINDER 30-HORSEPOWER PULLMAN RUNABOUT.

## IN THE MAKING OF A STEAM CAR.

With 35 years' experience in the manufacture of machinery on a large scale back of it, as a foundation upon which to build, the White Company would naturally be expected to embody in the construction of its new plant at Cleveland, O., the result of that knowledge gained through a long period of apprenticeship such as few other automobile manufacturers have had the advantage of. That the opportunity thus afforded has been fully availed of goes without saying; unhampered by any restrictions whatever, free play has been granted the architect, engineer and factory expert, to co-operate in the production of a plant that should lack no detail which could possibly contribute to the efficiency of production or the welfare of the operatives. The most modern ideals have been followed and the buildings are not only of single-story, fireproof construction with that most effective method of light distribution—the saw-tooth roof, but they are laid out according to a well-defined unit system with an eye toward facilitating present intercommunication and future expansion without disturbing the plant's well thought out symmetry as a whole.

Efficiency in production consists not only in having up-to-date machinery with skilled operatives to handle it, but involves as one of its chief factors what may be termed speed of progression. In every modern factory, the product advances step by step, though the various operations are carried on simultaneously and the finished product of each department is never mingled with that of another until it reaches the assembling room. But many parts must necessarily progress through various departments and it is the facility with which the raw material can be brought in and the parts in process transferred from one department to the next that has a very important bearing on the plant's capacity as a whole. In this respect, the White factory is certainly unique. Each building has a basement of its own length and 60 feet wide beneath it with which communication is had by means of electric elevators large enough to accommodate a loaded truck. In these basements, raw material is stored as well as parts, that, for some reason or other, must progress in advance of the requirements of the next department. The bodies of the White cars, which are built from beginning to end in the home plant, are an example of this, as they require eight weeks for their completion, while the plant has a capacity of ten finished cars a day, so that the body-building department's chief requirement is storage room. But one of the most decided novelties in factory construction designed solely with a view to facilitating intercommunication to the utmost, is a dividing corridor running the length of the buildings which branch from it on either side. This great artery is 600 feet long by 30 feet wide—the dimensions of a pretty fair-sized factory in itself, but it is used solely as an avenue of communication between the various departments. Its floor is of smooth concrete for the entrance of loaded trucks which may go directly into any of the departments, or from which heavy pieces may be lifted by an overhead traveling crane. Steel, concrete and glass form the chief materials of construction, wood being employed for flooring to a limited extent and for window frames, so that the buildings are considered fireproof to an extent where the company carries its own insurance risk.

So much for the buildings themselves. With the six-story administration building of imposing proportions and the independent power plant, they constitute a group covering an impressive amount of ground as well as representing an investment that strikingly illustrates the faith of their owners in the permanence of the automobile. But it is naturally the machinery and the methods of handling the cars to be in the process of construction, that are of the greatest interest. At present the power-plant consists of a 750-horsepower Erie, compound engine, direct-connected to a 500-kilowatt direct-current generator, and a pair of 300-horsepower boilers fed by automatic stokers, coal from the railway cars being dumped directly into the storage bins. Space

WHERE THE REINFORCED WOOD FRAMES ARE PUT TOGETHER.

ONE OF THE BASEMENTS WHERE THE BODIES ARE STORED.

has been provided for two additional power units of the same size and another set of boilers of the same capacity. Electric motors are used throughout for driving, being directly coupled in the case of small machines, and placed in the center of each section of line shafting for driving groups of machines. This shafting is symmetrically arranged throughout the plant and so fixed that it can be removed or shifted in a few hours, this also being true of the corrugated sheet metal partitions of the various departments, to permit of rearrangement consequent upon growth, so that remodeling of the plant to suit changing needs can be accomplished as often as the latter become manifest. The overhead steel work is utilized for trackage for small hoists, as illustrated by their use in the engine assembling department. The saw-tooth roof construction renders artificial lighting unnecessary in any part of the plant, except the basement, during the day, a liberal provision of group and single incandescent lights being made for night work. Each department has its own locker room, every possible provision being made for the employé's welfare.

Given unlimited space and abundant light, the next requisite is the machine tool equipment, and it is needless to add that not alone the most modern, but the most accurate and time-saving machines thus far produced have been installed. Every detail contributing toward rapid and accurate production has been carefully studied out with the result that each machine is a law unto itself. For example, the double milling machine which faces the engine cases, once set for this particular duty, will probably cut an entire season's supply before altering its adjustment. Then there is the multiple spindle drill which bores eight holes in the rear axle housing at one operation, the specially devised machine for cutting the burner slots and a multitude of others, each of which performs a special task. One of the most important departments is the hardening room, in which there are three furnaces heated by natural gas. Here the steel, bronze and aluminum entering into the make-up of the White car undergo special treatment. After passing through the various departments producing the finished parts, the visitor comes to the assembling room which typifies the whole establishment. There are exactly so many parts and exactly so many cars to be made from them; each operation is done in the same way and on the same part of the assembling floor, and, having progressed to the end of this, the cars go to the testing rack, where the power output at the rear wheels is measured by a dynamo and rheostat in the shape of a bank of lamps. They are then taken in hand by the road testers and on the completion of this important operation are fitted with bodies, which marks the close of their factory careers.

#### VALUE OF THE AUTO TO THE FARMER.

Just what the farmer can accomplish with the aid of the automobile has been shown by an enterprising individual who was an autoist before he was a farmer. H. E. Hesseler, a hardware merchant, resident in Syracuse, N. Y., recently came into possession of a farm located in the neighborhood of Cazenovia, and he has found that his Franklin car is an immense help in farming operations. He can carry a crew of laborers out the five-mile trip in the morning without starting over early or wasting any time; can pull loaded hay wagons, horse rakes and hay tedders in a manner to make the most up-to-date farmer open his eyes in wonder. If anything has been forgotten or is needed in a hurry, it is only a matter of a short time to go in and be back with it from the village. As an instance of the auto's value on the farm, it may be said that the crop of hay from 75 acres was harvested in a few days and at a rate hardly conceivable by the old-timers.

Endurance runs are frequently pretty strenuous affairs in this country owing to the abominable nature of the roads, but what must they be in Germany, where, in spite of the fact that no difficulties are encountered on this score, one must be able to emit *Zuverlässigkeitsfahrt* every time he wants to refer to the performance? The Teutonic tongue is certainly strenuous.

# Fashion's Autoing Fads Up-to-Date

By LAURA R. SEIPLE.

**E** DICTS from the oracles that dominate the automobile sartorial world set forth so many fascinating styles in coats and accessories that it is difficult to choose any one model that is "smartest." During the last few months it was evident that designers of apparel for use with the motor car were striving to give the enthusiast diversified models so that each and every woman shall be attractively and becomingly attired when she automobiling goes. There are, if possible, more stunning garments for the pastime than ever before. New materials have been introduced by enterprising manufacturers, and designers have supplied a wide range of charming models from which to choose. In fact, everything points more nearly to perfection in the way of comfortable clothing than ever before. With these facts staring us in the face and high prices for correct habiliment a consequential condition, it is the marked simplicity that is in noticeable contrast with the more bizarre fashions of a year ago.

Automobiling in the first cool days of Autumn promptly suggest change of raiment for heavier materials. Between seasons furs and fur-lined garments are uncomfortable, even on coolest nights, and this is the time attention should be turned toward clothing of proper weight, which mistake far too many persons make in the effort to economize on the seeming unnecessary extra expense of a "between-season" coat.

Another between-season is coming, if they would only think of it, and the styles are now so well crystallized that it is possible to make a light or medium weight garment do service two or even three seasons if the style be excellent in the beginning. The essential factor is to patronize a reputable outfitter at the start; the price may be a trifle higher than that asked by the man who does not make a specialty of certain lines of goods, but the satisfaction received more than pays for the few extra dollars spent with the dealer who knows his business.

The capital coat for automobiling is shown in one of the accompanying illustrations. Fashioned of brown and tan plaid homespun, the model is as well cut as it is practical. Biscuit-colored leather decorates the collar and cuffs, giving

enough tone to the tout ensemble to make it radically smart. Nothing could be jauntier than the little French felt "college" hat accompanying it, with its matching brown and tan plaid scarf. These hats are vastly becoming and well liked by the young contingent of automobilists. They may be tied as snugly over the head as desired without injury, and when the veil is removed the shape resumes its original lines or may be bent to suit individual taste.

With the general acceptance of the closed motor for going to and from evening functions, the automobile cloak de luxe is in order. A stunning one in rich dahlia-red rubberized silk is exquisitely embroidered with self-colored soutache braid and heavy silk threads. The sleeves are joined with narrow bands of hand embroidery and the collar, cuffs and cunning little cravat ends adorning the front are wonderful examples of needlecraft as it is being exploited in Paris. A short time ago the idea of lace or fancy needlework of any description on automobile toggery was unheard of, but with the growth of garish fashions in all classes of dress there is no telling where elaboration will cease.

Other coats of the same material are found in a large range of lovely colors, including all the new shades brought out this season, among which are Caledonia green, Laurier green, copper, pomino (old rose), elephant gray, dove gray, purple and kindred ecclesiastical tones that are fast gaining precedence over all other fancy shades. Some of these floral hues are as rich as the natural petals from which their colorings were borrowed. Another note that is an innovation of the season is the touch of foreign color added to nearly all outer garments. For instance, one of the recently unboxed cloaks now on exhibition at a fashionable outfitter's is in elephant gray Skibo serge, with touches of burnt orange velvet introduced in the collar and cuffs. The effect is strikingly pretty and so out of the ordinary that it places the garment in a class by itself.

One of the cleverest models in leather is in Caledonia green Scandinavian leather, lined with Burgundy colored silk. The length is three-quarters and the front and back are cut in a solid panel effect,

COAT OF SCOTCH TWEED

FOR THE THEATER VIA AUTO.

forming the yoke, which narrows a trifle as it descends towards the bottom of the garment. The sleeves are made with deep cuffs, to be worn turned back to form three-quarter length sleeves, or turned down to wrist length. Bands of leather and leather-covered buttons decorate the front, the high rolling collar is finished with leather frogs, and may be worn in storm effect, turned half way down, or in cape fashion, as preferred. A coat of this character is a good investment for the woman who uses her automobile for all purposes. The lovely shade of green is universally becoming and the model is dressy enough for almost any occasion.

Quite wonderful is a great coat of Irish frieze, lined with fur and outwardly decorated with stitching and strapping, a huge roll collar and deep cuffs of opossum fur in the same soft tones of the cloth. There is a strap around the waist that can be so adjusted as to completely transform the appearance of the coat, making it a tight-fitting model. The coat, as a whole, is an altogether invaluable possession for automobiling. Another charming cloak for warmth and one that is not weighty is made of cheviot-tweed in tobacco brown, with indistinct tracings of dark red threads. The body of this comfortable garment hangs in ample folds from a broad yoke, which relieves all possible crushing of the gown, also the absence of heavy dragging at the knees when the wearer is seated, which is a sad fault with so many long garments.

In the realm of millinery for automobiling there was never such diversity in styles and never such becoming shapes in small hats as the present season has brought with it. For long journeys there is a nobby little capotelette with slightly "tammed" crown, upturned brim at the back and sides and visor effect in front, which may be worn either up or down, according to individual fancy. Another popular shape is the cavalier, in soft felt. Over either model veils can be perfectly arranged, and both models are generally becoming. A chic little hat in Kentong silk, that heavy Japanese weave resembling old-fashioned poplin, is in the natural dust shade. The crown is full, being shirred, as it is, to the flexible brim, which is decidedly peaked in front to break the wind. A curtain and shield protecting the back of the head and ears is held in place by elastic bands covered with shirrings of silk. The principal advantage of Kentong silk is that rain and dust have little or no effect upon it.

When it comes to the automobile veil, which comprises, these days, the useful ones for riding and driving in more ways than in automobiles, there is wide choice. The washable silk mousselines of chiffon finish with crinkled or satin striped borders, which come in all colors and from two to five yards in length, are perhaps the most practical. Besides these, there are some wonderfully attractive ones in chiffon with more elaborate borders and others covered with velvet dots both in self tones and contrasting colors. Automobile veils with shirred ring and divided at the back are a wise choice for actual automobile service. A capital veil that is creating a sensation just now is in white silk mousseline shirred on a long spring that may be adjusted to any style hat. The face has mica inserted over the eyes and a mouthpiece of Oriental lace. An inexpensive veil that is liked by many women and bids fair to become a popular favorite, is in white

and pastel shades of single mesh veiling, with graduated size chenille dots sprinkled over the entire surface. This is sold by the yard, as is also a new double width maline decorated with small chenille dots. The long chiffon scarf has lost none of its former favor. Very lovely ones are being imported from the other side gorgeously decorated with gay flowers and rich Persian patterns. These are liked by women who prefer goggles to a veil when they are pressed into service mainly for the purpose of holding the hat in place. For evening wear the bizarre scarf is much in demand. The illustration on page 403, showing evening coat with hood arrangement, is fashioned of a long scarf formed in two little knots at either side of the forehead to give fullness over the hair, the back is caught with a long veil pin and the ends tied in a fetching bow at one side. This arrangement is a splendid one for going to the theatre; it covers the hair without disarranging it and offers ample protection in coldest weather.

Among the accessories there are some wonderfully practical items that have recently made their appearance. A black silk petticoat lined throughout with chamois skin is a capital idea, carried out by an enterprising manufacturer of automobile apparel. A chamois lined waistcoat is another practical garment being exploited; besides this, there is a very sensible shield or chest protector, with high collar, offering absolute warmth to the throat. These garments may be worn under various light-weight wraps with every comfort. Cloth leggings and high-topped boots are essential features in the well-ordered automobile wardrobe. They come in Scandinavian leather, suede and velvet, with fur trimmings; also finished simply with straps and stitching.

Long gloves that reach the elbow are fleece-lined and trimmed at the tops with otter fur. These are advised both for long and short sleeved coats, when they afford protection to the arms in either case, being worn, as they are, under the sleeve of wraps with wrist-length cuffs and meeting the lower edge of three-quarter lengths shown in evening wraps. The automobile glove par excellence is the white doe-skin gauntlet, while chamois-skin gloves of various lengths follow close seconds. Big buttons that are easily fastened are noticed on smartest light gloves, while on others the inserted elastic across the wrist proves most satisfactory to the wearer.

Of masks there are many and varied forms. The photograph showing face mask represents one of the most approved styles. The shape is so designed that the entire face is protected; an extra piece inserted over the nose leaves ample opening for breathing and the goggles are framed with chenille to make them rest comfortably against the face. The same style mask also comes with extra ear muffs, which will prove a boon in very cold weather. Silk and leather are equally liked for this shield, though the former is perhaps most desirable, since it is more porous than leather yet of sufficient thickness to thoroughly protect the skin from cutting winds and dust.

A knitted woolen jersey for women automobilists is among the latest fall productions. It is made perfectly plain and without a belt, and extends below the waist line. It has a becoming wide collar, to turn down, that may be fastened at will about the throat, and the cuffs are shaped and turned back. This garment makes a very cozy wrap under a large coat.

## CLUB NEWS FROM THE COUNTRY OVER

### UNIVERSAL LIGHTS ADVOCATED IN NEW JERSEY.

NEWARK, N. J., Sept. 16.—Secretary H. A. Bonnell, of the New Jersey Automobile and Motor Club, which now has a membership of 850, has sent a letter to each member urging them to work in unison for the enactment of a universal lights law, and increase the membership of the club, so that it will still have greater influence in defeating the passage of unjust laws aimed at automobilists. At present drivers of horse-drawn vehicles are not compelled to carry lights at night, with the result that very few do. The absence of lights has resulted in some bad accidents since automobiles became numerous and there have been many narrow escapes, in which the bright rays from acetylene lamps were all that enabled motorists to avoid running into horse-drawn vehicles that were either in the middle of the road or on the wrong side of it altogether. Another reason why the Newark club wishes to add to its membership list is the fact that the Automobile Club of Buffalo is making a strong canvass for members with the plan of becoming the second largest automobile club in the country, and Newark aspires to that honor.

There is some talk of the New Jersey Automobile and Motor Club holding races at the Waverley track on election day, November 5, but as yet nothing has been officially decided upon.

### CHICAGO CLUB TO TEST SPEEDOMETERS.

CHICAGO, Sept. 16.—During the course of the coming Chicago automobile show in December next manufacturers of speedometers will be given an opportunity to put their instruments through their paces. The show is to be held during the week of November 30 to December 7, and arrangements were completed by the Chicago Motor Club at its meeting last week for the holding of a contest of this kind. At least twenty different makers of speedometers are expected to enter the trials, which will be the first of their kind in the annals of Western automobiling, if not in this country. The tests will consist of freak runs, speed matches and the like, besides a number of stunts calculated to thoroughly test the abilities of the little instruments in doing their duty under adverse conditions. The club also announced its intention of holding a stag affair for visiting autoists and tradesmen during the week of the show.

### CALIFORNIA FORMS STATE ASSOCIATION.

OAKLAND, CAL., Sept. 13.—California now boasts a State automobile association affiliated with the American Automobile Association, and through the medium of the latter will be kept in touch with automobile organizations all over the country. The new association was recently incorporated, some of the moving spirits being such prominent California autoists as L. P. Lowe, Samuel G. Buckbee, Charles C. Moore, Herbert E. Law, E. R. Dimond, R. B. Hale, J. A. Britton and Oscar A. Cooper. The dues will be nominal, not exceeding \$5 for the first year, this sum consisting of \$2 for initiation and \$3 for the annual dues. It is confidently anticipated that the association will have a long membership roll in the near future, as its objects in upholding the interests of the sport appeal to all autoists.

### ALBANY CLUB POSTPONES ITS ROAD RACE.

ALBANY, N. Y., Sept. 16.—Owing to its inability to complete proper arrangements for the holding of its proposed 100-mile road race this month, the Albany Automobile Club, at a meeting held a few nights ago, decided to postpone the race until October. It is planned to hold the race on a circuit of roads south of Albany and the original plans called for holding it in September, but it was found impossible to do so.

### ALABAMA CLUB TO BUILD PALATIAL CLUBHOUSE.

BIRMINGHAM, ALA., Sept. 16.—Interest in automobiling in this city as represented by the Birmingham Automobile Club is growing apace. An informal meeting was held in the office of R. S. Munger a few nights ago for the purpose of discussing automobiling prospects throughout the south in general, and in this city in particular, during the course of which it was announced that 21 life memberships had been enrolled at \$1,000 each and that the required number of 30 would be made up within a short time. With the sum of \$30,000 thus collected work will immediately be undertaken on the construction of the clubhouse to be erected on the Mount Pinson road. The building will be a commodious establishment, fitted up with every modern facility, and will doubtless do a great deal to aid in fostering the activity now shown by the club in maintaining the enforcement of the law governing speeding, as well as advancing the interest of the automobilist in many other ways.

### LOUISVILLE CLUB TO PROMOTE RACE MEET.

LOUISVILLE, KY., Sept. 16.—At a meeting of the Louisville Automobile Club a few days ago it was decided to have an automobile parade and hold a race meet on "Louisville Day," September 18, at the Kentucky State Fair. The arrangements were placed in the hands of a special committee appointed by President G. H. Wilson. The parade will be for the purpose of showing the extent of the automobile activities of the club to the rest of the inhabitants and will be participated in by all the members. It will pass through the principal streets of the city and will disband at the Jockey Club, where the race meet will be held. An appropriation was made for prizes and all the expenses will be borne by the club treasury. The committee on parade management is composed of Eugene Strauss, chairman; Charles Chreste, J. F. Ross, Dr. H. E. Tuley and Louis H. Wymond, while the racing committee consists of Dr. J. W. Clark, chairman; Albert Reutlinger, H. Moore, J. B. Newman and Charles Mengel.

### KANSAS CLUB ELIMINATES SOCIAL FEATURE.

WICHITA, KAN., Sept. 14.—Forty autoists gathered in the parlors of the Commercial Club last night for the purpose of forming an automobile organization. It was at first proposed to organize a body on social lines, but the proposition was voted down. W. B. Throckmorton was elected temporary chairman and appointed a committee of five on permanent organization, consisting of F. A. Amsden, Thomas Arnold, Horace Williams, Scott E. Winne and Dr. Wilson. The committee decided that the name of the new organization should be the Wichita Motor League. A board of governors consisting of nine members was then elected as follows: W. B. Throckmorton, George Walker, F. A. Amsden, Scott E. Winne, S. W. Hess, C. L. Davidson, Thomas Arnold, Coler Sim and R. L. Millison.

### ATLANTA CLUB IS FLOURISHING.

ATLANTA, GA., Sept. 16.—For the first time since its organization about three months ago the Atlanta Automobile and Good Roads Association held a regular meeting, which took place one evening last week at the Piedmont hotel. Matters of general interest to autoists were discussed, as well as those of purely local importance, and the meeting was voted a great success. The club now has almost 100 members on its roster and the number is constantly being increased. Its officers are: F. L. Seeley, president; J. P. Stevens and E. H. Inman, vice-presidents; W. P. Andrews, secretary; Asa G. Candler, Jr., treasurer. A clubhouse, centrally located, will be the next thing considered.

**Moderate-Power Cars Com-** From producing ridiculously underpowered and overweighted machines that could scarcely drag themselves up the easiest of grades, manufacturers have gone as far as possible toward the opposite extreme. Naturally, there has been a demand for such cars, or they would not have come into existence: the number of 50 to 60 horsepower cars now in use amply proves this. When first taken up, the plan of providing a certain percentage of excess power was found valuable to enable the car to take ordinary hills without changing gear and to pull itself out of bad places without assistance. Twenty-horsepower was thought to represent a figure sufficient for all ordinary uses, so making 30-horsepower about a standard provided a liberal factor of safety in this respect.

But then there arose a demand for a car that could take extraordinary hills on the direct drive, as the result of which a sort of modern road locomotive has been developed. It is quite as evident that such cars can never represent the ideal machine for the average autoist as that steam yachts are not for the average man. Casual observation would seem to show the day of the moderate car—both in power and price—to be further off than ever, for the majority of makers are devoting attention to the production of larger and more costly cars—six-cylinder types, in short. While this is quite true, it is equally apparent that with few exceptions these six-cylindered cars are, in the great majority of instances,

mere bids for the rising tide of popular favor shown this type. Not one maker in twenty will rely for the bulk of his business on high-priced models alone during the coming season, and to a large extent this was true during the past year. "Oh, yes, we are building a number of those large cars, but our principal demand is for the lighter model," was a frequent answer by the maker regarding this season's output, usually meaning a 30-35-horsepower car as compared with one of 50-horsepower or over. A 20-24-horsepower car can go anywhere and do practically anything that one of twice its size is capable of, without carrying around a superfluous ton of weight to use up gasoline and tires. Both the autoist and the manufacturers are coming to recognize this, so the day of the moderate car may be said to have dawned.

**Depreciation of the Present Day Automobile.** If there be any one quality for which the automobile has been maligned more than any other, when regarded in the light of an investment, it is its factor of depreciation. That a car but a season old should command scarcely more than fifty per cent. of its original selling price would seem to place it almost in a class by itself in this respect, and, indeed, such was the case in its earlier days when the value of a car dropped to about the same extent as does a piece of millinery of the year before in the face of a radical change in style. The actual mechanical depreciation in these old cars was seldom proportionate to the great tumble in their market value, as witness the number of them still in active service. The exceptions consisted of those cases in which cars had simply been done to death by careless and reckless owners who rendered them fit for nothing but the scrap heap.

To a certain extent, the same holds good to-day; there are still autoists who ruin their cars in a fraction of the time they would last with reasonable care, but the general increase in knowledge, and far more than this, the vast improvements that have been brought about, principally in the materials employed, has made such cases rare. The modern automobile does not depreciate to anything like the extent that is true of a piece of machinery of any other class, and of the same value.

That some of the best-known cars apparently are still offered second hand at ridiculously low prices would seem to support the belief that things have not changed in this respect. This is far from being the case, as an investigation of the majority of these wonderful bargains reveals the fact that most of the subjects are only fit for the scrap heap or are very much out of date. Instead of 50 per cent., 20 to 25 per cent. is now a more usual drop, except where the reduction is due to the circumstances of the seller rather than the condition of the car, and it is now uncommon to find two or three-year-old cars in good condition selling at half their original prices.

**A Lesson in Preparedness from the Other Side.** If forewarned is forearmed, certainly early preparation for any event, whether it be an automobile race or contest or any field of human activity whatever, is a certain guarantee of success. French automobilists, who have never been guilty of arranging their competitions with that haste which some authority has declared to be of the devil, have surpassed themselves this year. Instead of drawing up the 1908 programme during the last days of December, the Racing Board of the national club has announced the conditions and date of its only event for next year almost before the echoes of the previous race have died away. Now the A. C. F. Contest Committee, concerning itself with the more utilitarian aspect of the industry, issues its programme for 1908 before autumnal leaves have begun to fall. Thus the main lines of touring and racing in 1908 are laid down months in advance, with an advantage to the manufacturer, the dealer and the general public which needs no elaboration. There is a lesson here the learning of which by the proper bodies would benefit the American automobile industry considerably.

### NO STOCK CAR RACE FOR LONG ISLAND.

There will not be any road race on Long Island this October for stock touring cars. At the meeting of the Board of Supervisors of Nassau County, held Monday afternoon, the application of the Metropolitan Automobile Association for a grant of the roads, October 16 and 17, was not presented. The exact reason

THREE WHO WANTED THE RACE.

Deputy Foster, Sheriff Gildersleeve, and Mr. Krug, of Krug's Corners, assisted in picking out a route in Nassau County.

may never be known, but it is probable that a combination of circumstances figure in the situation. T. F. Moore, president of the disappointed organization, insinuates that the promoters of the Long Island Motor Parkway had something to do with the change of opinion on the part of the supervisors; others assert that these same supervisors had not been convinced of the stability of the Metropolitan Automobile Association and its ability to conduct such an event in a satisfactory manner and protect the county from damage suits, etc. At any rate, there will not be a race, and naturally there is disappointment among those who advocated the holding of a contest, though some of these admit that the time was short to prepare properly for a successful race.

Sheriff Gildersleeve and Under Sheriff Foster, in conjunction with Mr. Krug, of Krug's Corners, lent considerable assistance to the Metropolitan Automobile Association in its preliminary efforts. Supervisors Cox, Christ and Painter first said that it would be impossible to secure sufficient oil to put the roads in proper shape for the contest. But this excuse didn't hold water any better than oil would mix with it, and the reason must be searched for in other quarters.

### GOOD ROADS AND GOOD LAWS CONVENTION.

Representatives of the automobile clubs of New England, as well as from clubs in New York, New Jersey and Pennsylvania, will assemble at Springfield, Mass., September 24 and 25, on which dates, under the auspices of the Automobile Club of Springfield, there will be a good roads and good laws convention. A notable array of good roads talent is assured, including the highway commissioners of most of the States, and the director of the Division of Roads of the Department of Agriculture at Washington. Of course, Robert P. Hooper, chairman of the Good Roads Board of the American Automobile Association, will be present, and accompanying him will be Highway Commissioner Joseph W. Hunter of Pennsylvania, and his deputy, R. D. Bremen. Commissioners MacDonald of Connecticut, Sergeant of Maine, and Edwards of Rhode Island are other State highway officers who will participate in the good roads session September 24.

In the afternoon good laws will be the subject discussed, and it is hoped that either President William H. Hotchkiss, of the A. A. A., or Charles Thaddeus Terry, of its Legislative Board, will present the views of the national automobile body on federal registration. In the evening will come the banquet at Cooley's Hotel, and it is promised that the speechmaking will be brief and entertaining rather than long and instructive.

Wednesday will be devoted to unfinished subjects and embrace an auto tour of Springfield and vicinity. The club expects that the affair will be the first annual of the kind, to be held each year in that city, and duplicated in other parts of the country.

### NEW HOME FOR PIERCE IN NEW YORK CITY.

Pierce Great Arrow has secured a new and more elaborate New York establishment, quitting the homestead at Broadway and Fifty-ninth street for a handsome dwelling at 233-237 West Fifty-fourth street, between the Automobile Club of America and Broadway. Salesroom and executive offices occupy the first floor; the second floor is for chauffeurs and sundry stock; the third is given over to minor repairs, fitting of tires and bodies, and at the top is one of the most complete repair shops in existence, with tools and appliances necessary for the most extensive work. With the 60-foot frontage and four floors, the Harolds Motor Car Company believe they will have all the space necessary for present needs of the Pierce. General Manager Robert D. Garden has with him R. W. Slusser and R. D. Willard as salesmen. The sale and repair of Pierce machines only will be undertaken in the new premises, no cars being taken in storage.

### JENKINS MOTOR CAR CO., OF ROCHESTER, N. Y.

ROCHESTER, N. Y., Sept. 16.—The Jenkins Motor Car Company have filed papers of incorporation with the County Clerk. The incorporators are J. W. Jenkins, Lewis H. Whitbeck, George W. Todd, Alexander M. Lindsay, Jr., and Ira M. Ludington. The company, which is capitalized at \$100,000, will manufacture high-grade automobiles of from 40 to 45 horsepower, which will be known as Jenkins cars. The company is building a plant on University avenue, near Culver road, two stories in height, and will contain about 20,000 square feet of floor space. Additional buildings are to be constructed from time to time on the two acres of ground which the company owns. About seventy-five workmen will be employed at the start. The election of officers will take place in a few days.

### THE FLIGHT OF THE PEERLESS SIX.

CLEVELAND, O., Sept. 16.—Following the flight of the new six-cylinder car from Cleveland, on a demonstrating trip through the East, most enthusiastic reports have been received at the factory over the interest displayed in all the cities through which this car passed. E. H. Parkhurst, vice-president of the Peerless Motor Car Company, accompanied the party as far as Boston. He returned to the factory Thursday, and expressed great satisfaction with the showing made by the new car on this trying run.

The route selected by the party was over the roads made famous by the Glidden tour of this season. No effort was made for any remarkable speed, the trip being made purely as a pleasure and demonstrating trip. Interesting statistics are now being compiled regarding the showing made by the new six-cylinder car, which will be ready for publication on the return of the car to the factory. C. H. Burman is driving the car.

PEERLESS "SIX" CROSSING BRIDGE AT LIGONIER, PA.

## BOSTON DEALERS ARE OPTIMISTIC AS TO TRADE CONDITIONS

BOSTON, Sept. 16.—More or less of a hue and cry has been raised in some sections of the country about so-called "depression" in the automobile trade, the sacrificing of cars by their owners, who have been pinched in the money market, and other things which would lead the outsider to believe that because four or five manufacturers are temporarily embarrassed the whole automobile industry is in a bad way. Now, Boston people have been hit as hard as anybody by the current state of the stock market, for they are large holders of copper stocks, and the raiding of these securities has been felt here very widely. But as for depression in the automobile trade, it is not apparent in Boston; in fact, the local trade is decidedly optimistic and looking forward to a busy season with the 1908 models.

As usually happens between the end of the selling season and the arrival of the new models, there is in progress a considerable rearrangement. Agencies for cars that have not been successful are being dropped or changed, while new agencies are being placed, and there is a kind of between-seasons uneasiness. But the dealers who have well-trying cars to sell and who have fixed up their plans for 1908 are all pretty busy, and those who have had the trial cars of the new product in town are kept on the jump following up customers, who appear to be as plentiful as ever. What is more to the point, leading dealers state that their outstanding accounts with old customers are less than usual, and new customers are buying more extras for their cars than ever before, indicating that they are not obliged to curtail.

It is not improbable that many owners will run their this year's cars another season, but that is not on account of financial stringency. It is merely a sign that the cars have become so perfected that the owners of good machines see no reason to change for a new model and they take pride in keeping their present cars going for another season. They do not fear the depreciation in their cars that has caused them to change in the past, as soon as the new models were on the market.

One of the most successful dealers in Boston is Alvan T. Fuller, who handles the Packard and the Cadillac. He has secured an increased number of cars for 1908 and is decidedly optimistic for the new season. He says: "Neither last year nor

this have we noticed what has been called depression. Already we have sold 117 Packard 1908 cars, and not only have we obtained the regular prices, but our customers have ordered more in extras than ever before. Recently we took an order from a Fall River man for three cars, costing him \$16,000. Another recent order was from a lady, who bought two cars costing her over \$10,000."

F. A. Hinchcliffe, manager of the Winton branch in Boston, has already had many inquiries about the new Six-Teen-Six, and he expects a good demand for these cars. He says: "We have noticed no falling off. People are not so crazy to ride all the time as they used to be, but they are coming to regard the automobile as a necessary means of transportation. If curtailment is necessary, automobilists will curtail in other directions before they sell their cars. We have not heard of any Boston people selling their cars at a sacrifice because of so-called hard times."

The New England situation is well sized up by John L. Snow of the Peerless branch, who has just made a trip through New England, visiting agents. He is satisfied with the outlook and believes that there will be a larger demand for real high-grade machines than ever before in this territory. "People are learning," he says, "that it is not profitable to buy a cheap car of unknown merits and they are now demanding first-class machines. This may result in trouble for some of the manufacturers and agents who have been getting their experience in automobile building and selling at the expense of the public." President J. H. MacAlman of the Boston Automobile Dealers' Association and manager of the Columbia branch sees good prospects ahead and says he has as many orders as usual for this season.

The above are merely examples of the expressions of opinion by the Boston dealers. Here and there one is to be found who is pessimistic, but he is usually more troubled about the other fellow's chances than about his own. New Englanders as a rule do not buy cars until they feel pretty certain that they can afford to own and maintain them. When they have made up their minds on that point it takes more than the manipulation of the stock market to scare them out of it, all of which is a tribute to the stern Puritan characteristics that predominate.

### NEW MANAGER FOR WAYNE COMPANY.

DETROIT, MICH., Sept. 16.—At the directors' meeting of the Wayne Automobile Company, held last week, C. R. Wilson and B. F. Everitt, of the Wilson Body Company, were elected to the directorate of the company. This change was brought about largely through the death of Roger J. Sullivan, formerly an active member of the firm. Officers were then elected, as follows: President and general manager, B. F. Everitt; chairman of the board and secretary-treasurer, Charles L. Palms; vice-president, J. B. Book; consulting engineer, William Kelley.

Mr. Everitt is known to almost every man in the trade, and is well liked and highly competent. Mr. Palms has been unable to give the Wayne company the time it deserved because of his duties in the management of the vast millions of the Palms estate, of which he is the administrator. Mr. Palms retains the same financial interest he has always held in the Wayne company, and will devote all the time he can to the general work of the company.

New agencies that will handle the "Wayne Thirty" have been closed as follows: A. L. Stanfield, Edgar, Ill.; J. L. Mott Company, Trenton, N. J.; T. S. Everitt Land Co., Redfield, S. D.

Savannah, Ga.—The Wilson Auto Company has opened a new garage at 349 Bull street. M. Ed Wilson heads the concern, which will take the agency for several lines of cars.

### ANNUAL MEETING OF ROYAL MOTOR CLUB.

CLEVELAND, O., Sept. 16.—At the annual meeting of the stockholders of the Royal Motor Car Company, held September 10, the old board of directors was increased by the election of George H. Worthington, president of the Cleveland Stone Company, and F. L. Alcott, vice-president of the Diamond Portland Cement Company, the old members re-elected being Daniel Shurmer, E. D. Shurmer, S. F. Haserot, H. A. Kelley, K. F. Gill, W. J. Gawne, E. S. Reese, K. V. Painter and T. F. Newman.

At the meeting of the board following the stockholders' meeting, the following officers were elected for the ensuing year: President, E. D. Shurmer; vice-president, Daniel Shurmer; chairman, S. F. Haserot; secretary and treasurer, A. D. Hatfield; engineer, Robert Jardine. The company has just completed moving into its new plant.

### A CORRECTION AS TO APPERSON PRICES.

In the issue of THE AUTOMOBILE of September 5, the price of the Apperson Model M, 30-35-horsepower car, was erroneously stated in the firm's announcement on page 66 as \$2,500. It should have read \$2,750. A similar error was made in the price of the 50-55-horsepower touring car which should have been \$4,200 instead of \$4,000.

# Last Act in Europe's

## 1907 Race Program

CAGNO, ON ITALIA, SPEEDING TO VICTORY IN EUROPE'S CLOSING RACE OF THE SEASON.

BRESCIA, ITALY, Sept. 7.—Europe's big racing program for 1908 has been brought to an end, so far as events of the first water are concerned, by a double Italian victory in the Brescia meet. Minoia, piloting an Isotta Fraschini 294.2 miles at an average of 64.7 miles an hour, was victorious under the German Emperor rules limiting cylinder area to eight liters; under Grand Prix conditions limiting fuel supply to one gallon per 9.59 miles, Cagno on an Itala took first place over the same circuit with an average of 65.3 miles an hour.

Brescia being too small to lodge all the interested spectators gathered together from all points of Europe, those unable to find a bed curled themselves up in their cars, if they possessed them, in railroad carriages, or in any other place that offered the little protection needed from the mild night air. The electric lights around the grandstands and the little patronized betting booths gave way to the sun, record crowds flocked to the track, the animated buzz of conversation was hushed as the crack of a pistol rang out, and Ceirano opened the game by driving off on his S. P. A. at 5:30 o'clock. Demogeot followed on Darracq, the others starting at intervals of 30 seconds with perfect regularity until Fitz Earle, on a Benz, closed the list of 34 competitors from four different countries.

Demogeot was first to finish the initial round of 37.7 miles, followed by Trucco's Isotta Fraschini, Ceirano's S. P. A., Durlacher's Wolsit, Viton's Rochet Schneider, Cagno's Itala, and Minoia's Isotta Fraschini. The fastest time on this first round was made by Minoia's Isotta Fraschini at an average speed of 67.1 miles an hour. The second round was slightly faster.

At the end of the second round Minoia's Isotta Fraschini was still leading, with Vincenzo Florio's Darracq, driven by Airoldi, a good second; the others in order being: Cagno on an Itala, Viton on a Rochet Schneider, Hemery on a Benz, and Demogeot on a Darracq. Several accidents occurred during the third round. Hieronymus, who drove in a daredevil manner, broke his nose through a collision with another machine; Durlacher, the driver of the Wolsit, dropped off the railroad bridge and had to be carried to the hospital; Hemery's mechanic fell from the Benz near the grandstand, rolled over several times, but was not seriously hurt.

At the end of the fourth round, half time, Minoia's Isotta Fraschini was first, a Rochet Schneider second, Demogeot's Darracq third, Hanriot on a Benz fourth, Darracq fifth, and Isotta Fraschini sixth.

Out of thirty-four starters, only eighteen remained on the course. All news came in from outside during the fifth round. The steering gear of Baron de Martino's Züst broke when traveling at high speed, killing the unfortunate driver on the spot.

Although Minoia lost a little of his speed during the last two rounds, he was never seriously menaced for first position, his lead at the end of the 302 miles being ten minutes over Hemery's Benz and nearly eighteen minutes over Hanriot's machine from the same factory. About a year ago Isotta Fraschini was bought by Lorraine-Dietrich, the Italian car which won the race being identical with the Dietrich from Luneville, with the exception of the radiator and the hub caps. On these grounds the French claim the victory as theirs. Michelin, who equipped the winner with rims and tires, has a performance to be proud of, the Isotta Fraschini starting and finishing the last race with the same set of tires. Second, third, fourth, fifth and sixth machines were also shod by Michelin and fitted with his dismountables.

Although France provided two of her best drivers for the second and third arrivals, the first position taken by an out-and-out French production was fifth place by a Rochet Schneider. Sixth place also went to Rochet Schneider and Darracq took seventh and eighth positions. Itala was unfortunate throughout. Henry Fournier went out on the first round. Cagno disappeared on the second round, and Fabry joined him on the fourth round. Bianchi might have done better had not Hieronymus collided with the firm's best driver.

Twenty shaft-driven and fourteen chain-driven machines started in the race. The proportions in which chain and cardan finished was 58 per cent. for the former and 30 per cent. for the latter. Military not being obtainable to guard the course, volunteers performed the service in a manner that gave entire satisfaction. Although there was a record crowd the track was never invaded

at any time. Last year the Brescia meet had to be abandoned owing to the refusal of the Minister of War to give aid.

The same starting point, the same crowd, the same enthusiasm, and again an Italian victory. For the second day of the Brescia meet Grand Prix conditions had to be observed, seven of the machines being those which had actually taken part in the big race on the Dieppe circuit last July. Cagno, unfortunately the previous day, came out victor at the end of this 302-mile race by driving his Itala car for 4:37:36 in pouring rain at an average speed of 65.3 miles an hour. There were

DEMOGEOT, WITH GRAND PRIX DARRACQ, CAME SECOND.

fourteen starters, half of them French and half of them Italian. The French had the enormous advantage of all having run in the Grand Prix; the Italians, including the Itala on which Cagno secured his victory, were all being tried out for the first time.

It is a severe blow to the French industry that in only one speed contest this year has she been victorious. All along the line Italy has won in such a convincing manner that it is impossible for the most patriotic supporter of the "national industry" to deny the importance of the success. Michelin equipped the winner with anti-skid tires—the heavy rain made the use of the steel studded band imperative—and, as on the previous day, supplied one set which held up from the beginning of the first to the end of the eighth round. That two cars should each cover over 300 miles at an average speed of more than 64 and 65 miles an hour without a moment's tire trouble is a wonderful performance. Demogeot, who came second on a Darracq, three minutes behind the winner, had four Dunlops which started and finished the race.

Cagno's compatriots were not fortunate, all of them dropping out of the race—most of them on account of mechanical defects—before half time. Two French machines failed to finish. Duray, driving a Lorraine Dietrich, skidded seriously on one of the turns, when leading by five minutes, and damaged his steering

gear. After a hurried repair he set out again, led the Itala at the end of the fifth round, and appeared a certain winner when his car took fire and he had to abandon. E. Fitz Shepard, on a Payard-Clement, was second, three minutes behind Duray, at the end of the fourth round, when his course was brought to an end by the car jumping over the Montichiari bridge. Six machines were left to finish, their order being Itala (Cagno), Darracq (Demogeot), Dietrich (Rougier), Dietrich (Gabriel), Bayard-Clement (Alezy), Bayard-Clement (Garcet). In addition to winning the race, Cagno made the fastest round, at an average speed of 71.9 miles an hour. In the French Grand Prix Wagner made an average of nearly 75 miles an hour for one round, driving a Fiat.

#### THE SPEED TROPHY.

## PROGRAM COMPLETE FOR FRENCH 1908 CONTESTS

PARIS, Sept. 9.—Meeting for the first time after the Coupe de la Presse, the Competition Committee of the Automobile Club of France has drawn up its program for 1908. Next April there will be an industrial vehicle competition, and in August the Coupe de la Presse will be run again on exactly the same basis as this year. It depends on the attitude of the government whether the preliminary touring event, forming a part of the Press Cup contest, will be over open roads or not. Should permission be refused the tour will have to be held on a guarded circuit. Body dimensions, weight limits and amount of fuel per 100 kilometers will remain unchanged. These two events will be the only utility contests organized directly by the A. C. F. The Racing Board having given full particulars of date and

conditions of the Grand Prix, the only event it will undertake, manufacturers are able to lay their plans for next season's public performances with assurance.

On the proposition of the Marquis de Dion the Commission has decided to consider the question of a permanent closed circuit in some mountainous district. Conditions required are about 25 miles round, several 10 per cent. grades not less than a kilometer in length, wide and well-made roads. The permanent circuit will not be in any sense an autodrome; twenty-five miles of good road in the Alps, the Vosges, or the Cevennes would answer the purpose. This project is independent of the one under consideration by the Racing Board, the requirements of that body being something in the nature of the Dieppe circuit.

#### LOZIER LINE TO INCLUDE A SIX-CYLINDER.

For the past twelve months the builders of the Lozier have been planning the addition of a six-cylinder car to their line for 1908, and it has finally been decided to add a 50-horsepower, shaft-driven car of this type to the Lozier family for the coming season. It will be known as Type I and will be practically the same as the new Lozier recently described in detail in THE AUTOMOBILE. The only exception will be found in the motor, which will consist of six cylinders cast in pairs, their dimensions being 4 5-8 inch bore by 5 1-2 stroke. Under the recently adopted A. L. A. M. formula, which the Lozier company has been one of the first to adopt officially for all their ratings, the output of the new six is slightly over 50 horsepower, and it has been given this designation. Under previous ratings it would have been called a "60," and it will have a speed of something like 70 miles an hour.

The motor will have a ball-bearing crankshaft, double ignition system, using a Bosch magneto, and set of accumulators, as well as all the other distinguishing features of the Lozier motors of the four-cylinder type. The wheelbase is 131 inches and the radiator is placed directly over the front axle. With touring car body and equipment the new six cylinder will list at \$6,000, the other members of the line being a 40-horsepower four-cylinder, chain drive, and a 45-horsepower, four-cylinder, shaft drive.

The recently organized B. & H. Motor Company, 147-151 West Forty-ninth street, New York City, has been admitted to membership in the New York Automobile Trade Association.

#### DETAILS OF THE RAINIER FOR 1908.

In announcing the specifications of the new Rainier for 1908, the builders call attention to the fact that its construction will be characterized by an entire lack of castings in places where the latter have usually been employed, such as for brake drums, differential housings and the like, lighter and stronger die-forgings of steel being used instead. Other features of note are the greatly simplified and improved low-tension ignition system using a Bosch magneto; the multiple disk clutch with cork inserts and a new and original type of automatic carbureter with air control on the dash. The gear-set provides four speeds forward, working on the selective plan of operation with the direct drive on the third, the shafts of the gear-set as well as the differential and wheels, all being mounted on F. & S. non-adjustable ball-bearings. The main motor bearings are of white babbitt enclosed in bronze cases. The rear-axle unit is the same as on previous models but has been considerably strengthened and provided with a double torsion rod, while the propeller shaft brake has been done away with, both sets of brakes now being of the internal expanding type and are located in hubs on the rear wheels, the latter now being 36 inches in diameter, shod with 4-inch tires front and 4 1-2-inch rear. The motor dimensions are 5 by 5 1-4 inches bore and stroke and the rating is 45-50 horsepower, lubrication being by means of a McCord force-feed oiler, gear-driven. A compression release is fitted to facilitate starting. The general appearance of the car remains the same, a seven-passenger aluminum body being fitted; the weight, all on, is 2,800 pounds.

TRUCK PREPARED FOR THE START ON ITS LONG TRIP.

### MITCHELL MOTOR TRUCK'S LONG TRIP.

A Mitchell motor truck is now engaged upon a trip from Chicago to New York, carrying a load of 3,000 pounds of freight. The trip is made wholly for the purpose of determining the reliability of the truck under such a strenuous program, and the economy of operation. The schedule does not call for an average of over 80 miles per day.

The motor truck is of the regular one-ton pattern, and the large overload of 50 per cent. above the regular rating is carried to prove that the efficiency of the rating is not exaggerated. Careful account will be kept of the amount of gasoline and lubricating oil used during the trip, and the result is confidently expected to demonstrate the practicability and the economy of this method of transportation. It is not expected that the truck will equal a railway train in the time consumed between terminal points, but it is believed that it will demonstrate that a load of merchandise may be hauled within a practicable time limit and at a minimum of cost.

The route to be followed lies along the lines of the Lake Shore and New York Central, and stops are scheduled at such cities as Toledo, Cleveland, Erie, Buffalo, Rochester, Syracuse, Utica, Albany and Poughkeepsie.

### VYING WITH THE SIDE SHOW AT RURAL FAIRS.

At the Michigan State Fair a friction-driven Cartercar took a turn with the freaks in amusing the crowd of spectators, and while it was doing its stunt the pink lemonade, the South Sea Islanders, the snake charmer and all the other weird attractions, each with its barker howling his very loudest, had to take a back seat. Even the "gap of death," the "death defying demonstration of absolute desperation" and more to the same effect from the human megaphone and the posters had to fade by comparison with the man who did tricks with the automobile, for this was something new.

PANORAMIC SCENE AT MICHIGAN STATE FAIR, WHERE THE CARTERCAR SEEMED TO BE THE POPULAR FEATURE.

NEW HOME OF THE JONES SPEEDOMETER IN NEW YORK.

### ANOTHER ADDITION TO AUTOMOBILE ROW.

New York's long and constantly increasing line of automobiling establishments that are daily going up further north along Broadway received a notable addition with the recent formal opening of the Jones Speedometer building at the corner of Seventy-sixth street and Broadway, in which ceremony the newspaper scribes duly assisted by punishing the buffet luncheon. The photograph illustrates the façade of the building, facing on Seventy-sixth street, as well as the end giving on Broadway, and it will be noted that the walls are largely composed of glass, while the building as a whole presents a pleasing exterior.

### CORBIN BUSY ON NON-STOP DEMONSTRATION.

At 6 P. M. on Monday, September 9, a Model 8 24-horsepower air-cooled Corbin motor was cranked up at the Corbin Motor Vehicle Corporation's showrooms, 1892 Broadway, and left to run under public gaze. A week later, at 1 A. M., on Monday, the 16th, the car was run out of the garage with orders to reach Boston. Before going, however, its high gear was sealed in by E. V. Stratton, of the New York Automobile Trade Association.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Work is being rushed on the new plant of the Chadwick Engineering Works, at Pottstown, Pa., and the company expects to have same in operation by November 1.

The Jackson Automobile Co., Jackson, Mich., has purchased the plant of the Jackson Vehicle Co., that city, and will use the buildings as a factory. The property has an assessed value of \$115,000.

Walter Christie's circular track record of the mile in 52 seconds, made at Minneapolis, September 7, adds another to the list of Diamond wrapped tread tire achievements. All of Christie's racing for the past two years has been on these tires.

Changes has been made in the headquarters of the F. N. Motor Club of America, which will hereafter be located at 2234 Broadway, New York City, instead of at 2208 Broadway. Alfred G. Hanke has been elected treasurer and a director of the club, in place of F. V. Littlefield.

In the recent boulevard straightaway races at Wildwood, N. J., a stock Great Chadwick "Six" covered a mile in 52 seconds, which was a course record for gasoline cars. The Chadwick captured the touring car championship of the meet, and defeated a couple of Stanley steamers and several high-powered runabouts in another event.

King Edward VII of England has just ordered a fine pair of 10-inch Rushmore headlights for his new 60-horsepower English Daimler. The lights, which have just been shipped, are of the plain front type, nickel-plated and very handsomely finished. The Rushmore Dynamo Works has also shipped a pair of 9-inch Rushmore lights for Prince Louis of Battenburg.

The Knox Motor Truck Company, Springfield, Mass., has delivered three Model B 3-ton trucks to the Model Transfer Company, of Hackensack, N. J., and New York City. These trucks are run on regular daily trips between the metropolis and Ridgewood, N. J., for suburban deliveries, covering 50 miles per day, each doing the work of four double teams.

The manufacturing facilities of the B. L. M. Motor Car Company have been greatly increased by the acquisition of a building adjoining its present factory in Brooklyn, N. Y., which gives a total floor space of over 45,000 square feet. In addition, a building 60x100 feet is being erected in the rear of the present building, which will be used for assembling. It has been decided to limit the output of B. L. M. cars for 1908 to 250, despite the fact that the company's agents have already asked for a larger number than this.

The White Company announces that this year White steamers will be exhibited at the show of the Association of Licensed Automobile Manufacturers, to be held in the Madison Square Garden, November 2-9. The White Company, being entirely independent of and indifferent to the Selden patent situation, has always been in a position to go with either the licensed or unlicensed group. For the last two years the White steamers have been exhibited at the unlicensed show, but this year it has decided to exhibit with the licensed cars.

"On the Art of Cutting Metals," by Frederick W. Taylor, M.E., Sc.D., which was

the presidential address presented at the last annual meeting of the American Society of Mechanical Engineers, has been printed and bound in cloth by the society, price \$3.00. This or any other publication of the society may be had by addressing the secretary, 29 West Thirty-ninth street, New York. It is not necessary to send orders through members. None of the publications of the American Society of Mechanical Engineers are copyrighted.

Word has gone out to all of the representatives of the Thomas cars that hereafter cars made by the E. R. Thomas Detroit Company will be known as the Thomas Detroit instead of the Thomas Forty. The change is made, it is explained, primarily for the purpose of avoiding the confusion between the names Thomas Forty and Thomas Flyer that has been apparent during the past year. Both cars are distinctive in design and outline, and are made in separate plants—the Thomas Detroit in a new steel and concrete building in Jefferson avenue, Detroit, and the Flyers at Buffalo. The Detroit Thomas cars are, however, marketed by the E. R. Thomas Motor Company, of Buffalo.

The Aerocar Company, with factory and headquarters at Detroit, having been adjudicated bankrupt by the United States District Court, the Detroit Trust Company was appointed receiver, and on September 10 was unanimously elected trustee in bankruptcy for the concern. Realizing the importance of an early sale, so as to secure to the purchaser the 1908 business, which will soon be under way, the trustee has secured an order to sell the entire plant and property of the Aerocar Company at public auction September 24, either in parcels or in bulk. The inventory and appraisal of the plant amount to approximately \$192,000, and the property consists of land and buildings, conveniently situated on railroad, and full lines of machinery, tools and appliances; a large stock and partly manufactured product and some complete machines; a large amount of automobile parts, patterns, patents and trade marks, and accounts receivable.

### RECENT BUSINESS CHANGES.

With a view of securing more convenient and commodious sales quarters, the New York branch of R. M. Owen & Company has leased the property at 1759 Broadway, which was formerly occupied by Smith & Mabley. The Owen Company will move from its present quarters on or before October 1.

The Harry S. Houpt Co., the well-known Eastern representatives of the Thomas line, with headquarters in New York City, has succeeded the Autovehicle Company, of Newark, N. J., as representatives of the Thomas line in New Jersey. The Newark salesrooms will be maintained at the old address, with George T. Cole as resident manager.

President Bailey, of the York Motor Car Company, of York, Pa., has decided that the growth of the company's business in Philadelphia has warranted the establishment of a branch house to succeed the Pullman agency, which has been in existence for about a year at 205 North Broad street. The new deal goes into effect at once, the branch occupying the old agency quarters.

A. M. Spear, Jr., has resigned his position as manager for the business of J. A. Dowling, Portland, Me., and will start for himself in the automobile business in that city. Mr. Spear has leased a salesroom on Exchange Street, has secured the agency for a fine line of cars and expects to be in readiness to receive customers by October 1.

### PERSONAL TRADE MENTION.

Frank C. Thomas, for some time press representative of the Cadillac Company and later of the Pope Companies, is to be the automobile editor of the new Boston *Tribune*. An up-to-date department is to be conducted.

John R. Bensley has been appointed manager of the commercial vehicle department of Fairbanks, Morse & Company, Chicago. Mr. Bensley has been identified with the auto trade in Chicago for some years, and brings an extended experience with him.

The Hills Motor Car Company, Royal Tourist agents in Philadelphia, has been strengthening its selling force. Last week it added to its list of salesmen Robert W. Blake, former manager of the Knox branch, and W. C. Middleton, who has been connected with the Titman & Leeds Company, Matheson and Studebaker agents.

### NEW TRADE PUBLICATIONS.

A booklet of great typographical beauty, which may rank as one of the most comprehensive publications on the 1907 Glidden Tour, has been issued by R. M. Owen & Company, the general sales agents of the Reo car, whose executive offices are in New York and factory at Lansing, Mich. Among the good features is a series of clear and accurate maps showing the route of the 1907 Glidden Tour, the towns passed through in each of the seven States, and the principal towns covered in the 500-mile official non-stop run of the 16-horsepower Reo No. 33, from New York to the Jamestown Exposition, after finishing the Glidden Tour with a perfect score. The booklet will be interesting to all automobilists, and particularly useful to those who contemplate visiting Jamestown before the close of the summer touring season.

The wording of the title page of the latest Stevens-Duryea publication, "A catalogue of the Stevens-Duryea automobiles, with especial reference to the six-cylinder cars," does not do justice to the work of the compiler and printer. Elegantly bound within stout boards, printed in black and colors on high-grade paper, illustrated with line drawings, half-tones and full-page color prints, the book is far above the ordinary range of trade catalogues. The subject matter, too, is of a nature to interest and instruct all who are interested in automobiles, diagrams and concisely written text telling in a logical manner the story of the Stevens. The usual specifications are given, but do not occupy the major part of the book. A further quarto publication from the Chicopee Falls, Mass., factory deals pictorially with Stevens-Duryea limousines. A series of handsome half-tones are mounted on hand-made paper, given just sufficient text to make them explicit, and bound in a green cover. They form an excellent presentation of the firm's line of elegant limousines.

# THE AUTOMOBILE

## Auto "Heavy Weights" by the French Army Being Tried

PARIS, Sept. 17.—"Heavy-Weights," as the French designate commercial vehicles, are again playing an important part in the Southwest army maneuvers, and attracting considerably more public interest than ever before.

The army possesses its own fleet of eight vehicles bought after long competitive tests from De Dion Bouton, Mors, Turgan, Darracq-Serpellet, Gillet-Forest, and Delahaye. In addition seventeen firms have responded to the invitation of the army authorities with 32 machines: Berliet furnishing six, Dietrich two, De Dion, Panhard, and Mors two each. The eight machines owned by the government are naturally operated by picked men from the army automobile corps; the machines lent for the maneuvers are driven, as far as possible, by mechanics from the maker's factory, who have thrown off the blue overalls to spend twenty-eight days under the flag. Such an arrangement is pleasing to the men, who naturally prefer a continuance of factory duties—though under military rule—to handling a rifle and performing fatigue duty, insures reasonable care of the vehicle, and gives the best service to the army.

Excepting the Darracq-Serpellet steamers, all the vehicles are operated by internal-combustion motors of the four-cylinder type, engine carried forward, and are fitted with bodies suitable for the transportation of provisions. One Mors has a special tank body for carrying water to distant camps and along with the troops when under marching orders. Dietrich has a six-wheel chain-driven wagon which attracts considerable attention. As indicative of the greater interest now being taken in commercial vehicles in France, it is interesting to note that a large number of engineers from the leading factories are following the troops in order to closely observe the performance of the automobiles.

No better test of automobile transport could be had than these three weeks under military rule. The machines are working in teams: in one are grouped the slower vehicles with metal-shod wheels, carrying three to five-ton loads; several more rapid teams take the lighter loads up to three tons. At 5 o'clock each morning the teams are loaded up, provisions and water are carried out to the troops in the field, and the return journey is made empty. Order of march is the usual military one by convoys at a fixed speed of seven to

ten miles an hour, according to the order of the officer in charge.

This year the service has been performed in a remarkably regular and efficient manner, the automobile convoys being equal to the horse-drawn teams in reliability, with the enormous advantage of greater power and speed. One day

per week each wagon is accorded leave of absence for adjustments or repairs. These latter, however, have been very rare, Purrey's big factory at Bordeaux, placed at the disposal of the army corps, not often being called upon to render help.

One of the minor difficulties in the operation of the wagons is that of speed. Each driver, confident in the ability of his charge, is anxious to push forward at a higher rate of travel than prescribed by the officer in charge. Breakdowns, whenever they have occurred, have been traceable in most cases to the endeavor of the driver to obtain the maximum speed from his motor.

Road surfaces around Bordeaux are good, though hilly, but in following after troops on the march it is not always possible to stick to national highways. Frequent excursions over rough lanes and at times across country provide strenuous tests for men and machines.

Last year automobile vehicles were employed exclusively in transporting drinking water to the army corps engaged in the maneuvers at Langres. The task was not one of the easiest, for the district in which the troops were operating was entirely destitute of water, and every drop had to be carried in the special tanks fitted to the automobiles. During this severe test, where the breakdown of a single vehicle would have caused considerable inconvenience to officers and men, the automobiles gave entire satisfaction, all journeys being made regularly and without accident.

When the southwest maneuvers were being planned, it was decided by the Etat-Major to employ automobiles exclusively for carrying provisions from the army base at Bordeaux to the two corps in the field. The experiment was not a rash decision, for the Army Service Corps had during previous years watched closely the work done by automobiles in army work, and in addition had followed with the closest attention all the commercial vehicle competitions held by the French club. The army itself was but meagerly equipped for this work with a Delahaye, a De Dion Bouton and a Gillet-Forest bought at

DIETRICH SIX-WHEELER CAN HANDLE BIG LOADS.

the end of the 1906 military competition, and two Darracq-Serpollets, a De Dion Bouton, a Mors and a Turgan obtained at the close of this year's commercial vehicle competition. These eight were handled by military automobilists taken from the first company of artillery workmen. With the 32 wagons of all kinds supplied by private firms, a very important fleet of automobiles for transport service was obtained. An indemnity of about 17 cents per horsepower and per day is paid by the Government for each vehicle. Fuel, oil and grease are provided by the army authorities.

At the commencement of the maneuvers the forty vehicles were divided into two classes. At daybreak of the first day one division set out from Bordeaux loaded with provisions to be delivered at the camps indicated, somewhere within a radius of seventy miles. Traveling in convoy at a speed of from seven to ten miles an hour, the provisions could not be discharged before two or three o'clock in the afternoon. Their mission for the day accomplished, the convoy would reach some town or village about twenty miles nearer Bordeaux, their base, and pass the night there. The next morning an early start would be made for Bordeaux, that city being entered about noon. After the trucks had been loaded up, each one would proceed to the military garage, where the drivers would carefully examine their vehicles in order to be in perfect condition for an early morning start the next day. An officer in charge of this garage had strict orders not to allow any vehicle to leave unless it was apparently in a condition to accomplish its journey.

This two-day program, repeated throughout the grand maneuvers, brought twenty wagonloads of provisions to the fighting line each day. The two divisions were subdivided into classes,

according to the average speed they were able to maintain, and an officer was placed in charge of each of these.

Although a circle of seventy miles was fixed as the limit of action for the automobile wagons, as the troops moved away from their base this distance was frequently increased, some of the vehicles covering 160 miles in one day. On several occasions, too, the roads to be traversed to reach camp were far removed from the standard of *routes nationales*. Nevertheless, the work was done in an excellent manner, the provision wagons undertaking the double duty of carrying back the wounded—more frequently those suffering from minor ailments—on their supposedly empty return journeys. Two only of the forty automobile wagons had to be withdrawn as the result of mechanical troubles before the end of the maneuvers; not a single case of late arrival has been reported, nor have the troops ever been held back because of a slow working Army Service Corps.

Apart from the "Heavy Brigade," reservists called to the regiment have in a score of cases brought their automobile and placed it at the disposal of staff officers for twenty-eight days. Captain Genty, known to the public as De la Touloubre, the racer, transports a number of staff officers from point to point in a Panhard; General Picquart uses a Dietrich, with a Berleit following in attendance; Lieutenant Taffoureau, in charge of one of the convoys, follows his vehicles in a 15-horsepower De Dion, lent for that purpose; Lieutenant Petitet has a 60-horsepower Aries, also loaned, with which it is possible to run up and down the line of march. In addition to "heavy weights" and touring machines, a number of motorcycles are employed, carrying orders from headquarters to distant points. It is quite possible that motorcycle brigades will supplant the existing cycling corps.

WAITING FOR ORDERS—A ROADSIDE SCENE DURING FRENCH SOUTHWEST ARMY MANEUVERS.

# Britain's Commercial Vehicle Trials

evening. This has been necessary owing to the wide range of vehicles entered and their consequent varying speed. Eight one-day exhibitions have been arranged at Bristol, Birmingham, Liverpool, Manchester, Leeds, Sheffield, Nottingham and Bedford, thus giving business men of the most prominent towns traversed an opportunity of inspecting and obtaining information concerning the vehicles. The daily runs are sufficiently strenuous to be of some value in demonstrating the relative value of the machines engaged, but the event is probably more of a traveling exhibition than a competition. The routes have been laid out to give participants the greatest amount of exhibition in the shortest time, and in this respect England, with its closely adjoining towns, is an excellent field of operation. Expert salesmen accompany the tour. With entries limited to two per firm for each class, it is a valuable proof of the wide extension of the commercial vehicle in England that such a large number of

COMMERCIALITIES LEAVING CHISWICK ON FIVE WEEKS' EXHIBITION TOUR AND TEST.

LONDON, Sept. 16.—British advocates of commercial motor vehicles have been rewarded for their long wait by a competition and demonstration of such magnitude that good results are bound to accrue to the industry as a whole. A joint committee from the Royal Automobile Club, the Society of Motor Manufacturers and Traders and the Commercial Motor Users' Association drew up the regulations, the carrying out of which are entirely in the hands of the national club. Load carrying capacity has been taken as the basis of classification, seven classes being provided, capable of taking loads from 1,120 pounds to 6 1-2 tons. No attempt is made to group vehicles into mechanical classes, gasoline, steam, and gasoline-electric running together on a commercial basis of load carrying power.

Of the 62 vehicles which entered, no fewer than 56 started from Thorneycroft's yard at Chiswick, near London, on September 8 for their five weeks' tour. With the exception of the 5 1-2-ton class, which only obtained one entrant, who had to be transferred to the higher category, each division was well represented, the three-ton class being the strongest. From Chiswick the run will be along the Thames valley to Reading, then westward to Bristol, northwards to Gloucester, Worcester, Birmingham, Stafford, and Liverpool; the busy manufacturing district through Lancashire and Yorkshire will be traversed in almost every direction and a southward run to London made by a more central route. A feature of the arrangement is that the different classes will take different routes, but will meet at one given point each

competitors should have been obtained. Further, passenger vehicles are barred, thus keeping out a few firms having only 'bus bodies on their chassis. British firms have the largest representation, the list including practically every home factory of importance; France has eleven vehicles sent by Turgan, De Dion Bouton, Unic, Darracq, and Darracq-Serpellet. Germany's representatives are seven Milnes-Daimler vehicles. Italy contributes a couple of Fiat five-ton trucks. With the exception of Darracq-Serpellet, all the foreigners send internal combustion motors. The Britisher's love for steam appears to be losing ground slightly, as internal combustion motors have become more and more perfect. In the 5 1-2-ton class steam and gasoline are numerically equal; for all vehicles carrying a lower load gasoline is unmistakably supreme. The only structural features in which there is marked uniformity among the competing vehicles is in final drive and mode of ignition. Fifty per cent. have double chain drive; seven per cent. employ the cardan, the remainder comprising single chain, worm gear, and internal gears of special types. Low-tension magnetos are employed in the proportion of 45 per cent., high-tension magnetos are used on 28.5 per cent. of the motors, and storage batteries in the proportion of 26.5 per cent. Thirty per cent. have batteries as a standby.

Road regulations call for an average speed varying from twenty to five miles an hour in the different classes. The load carried primarily determines the running schedule, but tires also have their influence. Thus for one class calling for twelve miles

EDITORIAL SANCTUM ON A MILNES-DAIMLER CHASSIS.

TAKING THE WEIGHT OF A THREE-TONNER.

an hour a reduction is made to eight miles when metal shod wheels are used; the five-mile-an-hour class has to furnish twelve miles if soft or elastic material is used in place of metal shod wheels. During the five weeks the fastest vehicles will travel 1,540 miles, being an average of about seventy a day. Those limited by legal restrictions to twelve miles an hour will cover 1,210, 1,100 or 880, according to the load carried. The heavy steamers with trailers attached will cover less than 700 miles, police regulations forbidding them to move faster than five miles an hour. Speeding is forbidden under penalization. An observer appointed by a rival firm is carried on each competing vehicle, with instructions to record all incidents of the road. Arrangements are made by the club for a supply of fuel at all stages along the route. Covered parking stations being impossible at

every point, competitors must carry their own tarpaulins or whatever protection they may consider necessary for open-air storage. In determining awards the judges will take into consideration accessibility, adequacy of platform area and convenience of loading, adhesion (loaded and light), ease of manipulation, finish and workmanship, freedom from nuisance to public, brakes, condition after trial, cost per ton-mile, hill climbing, maneuvering, quiet running, repairs and replacements. One man only is allowed on the vehicles in addition to the observer, except in the case of steamers, where a stoker is allowed. To encourage punctuality a special prize of \$20 is offered to the driver most regular in arriving and leaving control according to his official schedule. At the end of the tour the vehicles will be taken to the large Vanguard Motorbus Company's garage in London.

## U. S. GOVERNMENT TESTS ALCOHOL AS FUEL

WASHINGTON, D. C., Sept. 23.—An exhaustive report on tests of internal-combustion engines on alcohol fuel has just been completed for the Department of Agriculture by Prof. C. E. Lucke, of Columbia University, and S. M. Woodward, one of the Department's experts. Recently in this country a widespread interest has developed in the possibilities of alcohol as a fuel. The question of a possible substitute for the petroleum fuels will become of increasing importance as time goes on. The supply of crude oil to be obtained in the United States must ultimately diminish, and the history of the past indicates that a constant increase in price of kerosene and gasoline may reasonably be expected.

The tests made by Prof. Lucke and Mr. Woodward were carried out in New York City, chiefly in the mechanical engineering laboratories of Columbia University, between October 1, 1906, and February 1, 1907. Most of the engines used were loaned by their makers for the purpose of the tests. Each of the eight engines was run on alcohol as well as gasoline or kerosene for which it was designed. The engines used were: 15-horsepower, 2-cylinder, vertical, 4-cycle gasoline engine; 6-horsepower, horizontal, 4-cycle gasoline engine; 6-horsepower, horizontal, 4-cycle gasoline engine; 6-horsepower, vertical, 4-cycle gasoline engine; 6-horsepower, horizontal, 2-cycle kerosene engine; 40-horsepower, 4-cylinder, automobile gasoline engine; 40-horsepower, 4-cylinder automobile gasoline engine; 2-horsepower, vertical, 2-cycle marine gasoline engine. The following general conclusions were drawn as the result of the investigations:

Any gasoline engine of the ordinary types can be run on alcohol fuel without any material change in the construction of the engine. fuel.

The only difficulties likely to be encountered are in starting and in supplying a sufficient quantity of fuel, a quantity which must be considerably greater than the quantity of gasoline required. When an engine is run on alcohol its operation is more noiseless than when run on gasoline, its maximum power is usually materially higher than it is on gasoline, and there is no danger of any injurious hammering with alcohol such as occurs with gasoline.

For automobile air-cooled engines alcohol seems to be especially adapted as a fuel, since the temperature of the engine cylinder may rise much higher before auto-ignition takes place than is possible with gasoline fuel; and if auto-ignition of the alcohol fuel does occur no injurious hammering can result. The consumption of fuel in pounds per brake horsepower, whether the fuel is gasoline or alcohol, depends chiefly upon the load at which the engine is being run and upon the setting of the fuel supply valve. It is easily possible for the fuel consumption per horsepower hour to be increased to double the best value, either by running the engine on a load below its full power or by a poor setting of the fuel supply valve.

These investigations also showed that the fuel consumption was affected by the time of ignition, by the speed, and by the initial compression of the fuel charge. No tests were made to determine the maximum possible change in fuel consumption that could be produced by changing the time of ignition, but when near the best fuel consumption it was shown to be important to have an early ignition. So far as tested the alcohol fuel consumption was better at low than at high speeds. So far as investigated, increasing the initial compression from 70 to 125 pounds produced only a very slight improvement in the consumption of alcohol. It is probable that for any given engine the fuel consumption is also affected by the quantity and temperature of cooling water used and the nature of the cooling system, by the type of ignition apparatus, by the quantity and quality of lubricating oil, by the temperature and humidity of the atmosphere, and by the initial temperature of the

## EDGE MAKES COMPARATIVE FUEL TESTS

LONDON, Sept. 16.—With a view to testing the capabilities of British fuel for automobiles, S. F. Edge has been making a number of tests recently under the control of the Royal Automobile Club. The most recent of these was a comparative test of gasoline put on the market under the name "Shell" spirit and benzol. With a 40-horsepower Napier, a couple of 200-mile journeys were made from London to Grantham and back, "Shell" spirit being used on the one trip and benzol on the other. No adjustment or alteration was made to the carbureter for the benzol, though it was of much greater specific gravity than the petrol; obviously, some alteration should have been made to get the best results, but even using it under the adverse conditions the result was excellent.

"Shell" spirit gave 19.96 miles to the gallon, and on benzol the mileage was 19.27 miles to the gallon. The weight of the car with

four passengers being 3,870 pounds, the test showed that for one ton carried on "Shell" spirit the automobile ran 34.48 ton-miles to the gallon and on benzol 33.303 ton-miles to the gallon. The difference between the two results is really negligible, and had the carbureter been adjusted to benzol the car would probably have run further on that fuel than on "Shell" spirit, the best gasoline procurable.

The comparative tabulated results of the two tests, as certified by the Royal Automobile Club, conditions being identical on each occasion, are as follows:

	Gasoline	Benzol
Ton-miles .....	345.52	345.52
Ton-miles per gallon.....	34.48	33.303

Edge states that he intends later to carry out tests with benzol only, with the carbureter adjusted properly to suit it.

## AN AUTO'S ADIRONDACK INVASION.

That there are some places where an automobile cannot travel, goes without saying, but that the number of them is constantly being decreased is also a matter of such common knowledge as hardly to call for comment. The members of the Adirondack League Club are fully convinced that the number has been reduced by one at least, and will no longer regard the 1,300-foot climb on the 20 miles of road separating Forreestport from Lake Honnedaga in the Adirondack mountains as an impossibility. Up to a short time ago the members of the club were in the habit of abandoning their cars at Forreestport in favor of the stage coach which carried them the remaining twenty miles of the journey to the camps along the chain of lakes in the club's 100,000 acre reservation. Lake Honnedaga is 2,300 feet above sea level and 1,300 feet above Forreestport, and there were good reasons for doubting the impossibility of making the trip by automobile, for it had been tried before and the fifteen-mile stretch where there is no road at all, had proved too much for even the best intentions.

So thoroughly convinced were the club members that the feat could not be accomplished, that they never expected to see an auto make the trip and were not loath to issue a *defi*, which was promptly accepted by Manager R. D. Garden, of the Harrolds Motor Car Company, and New York representatives of the George N. Pierce Company, of Buffalo, N. Y. Negotiations were concluded through Robert W. Slusser, one of Mr. Garden's salesmen, and a 40-horsepower Pierce-Arrow was sent by boat to Albany and driven over the 120-mile stretch intervening between the capital city and Forreestport. The car was in charge of John Williams—the boyish-looking, quiet little chap who always ornaments the wheel seat of a Pierce every time a car of that make is entered in a competition of any kind in the vicinity of New York, for Williams knows the Pierce from beginning to end; he knows what it can do and, more than that, knows what he can do with it. He is one of those drivers who goes along steadily, minding his own business and without any attempt at grandstand plays along the road for the benefit of a few "rubes" or the discomfiture of the occupants of another car, so that he is always in front at the finish with his car and himself and passengers far cleaner than any other outfit in the competition. His work in the A. A. 1,500-mile mud-plugging match last summer was something that came in for considerable comment, so that Mr. Garden was safe in concluding that Williams in a Pierce was a combination that could be relied upon in an emergency.

TOP OF A BAD HILL HALF WAY FROM THE LAKE.

Williams arrived at Forreestport on schedule time, and just to show that a few more or less made no difference, took along some members of the club and Uncle Sam's representative in the person of the mail carrier. Just one hour and thirty-one minutes were required to make the climb, and in their enthusiasm at the successful achievement of the hitherto impossible feat, the club members decorated the car with a sign to the effect that it was the first automobile to enter the region. The return trip was made in 1:12, and then the car was sent back and forth over the route several times to demonstrate that it was not a matter of being able to accomplish it once as a herculean effort, but was easily within the capacity of the car. On each occasion the mail carrier and some of the club members were taken along, though the nature of the going, whether up or down, was hardly such as would entitle the trip to be called "joy-riding." Williams was quite certain that there was nothing in the whole two-week road nightmare of the three A. tour that could hold a candle to the Adirondack climb, and was naturally proud of his achievement in succeeding where others had failed.

ON THE LITTLE FALLS AND NEWPORT ROAD, WHERE THE UNDULATING HILLS PRESENT A PICTURESQUE SCENE TO THE TOURIST.

ENROUTE VIA STAGE ROAD FROM ESTES PARK TO LYONS.

A PARTY of four of us started from Colorado Springs for a two weeks' tour of Colorado in a Holsman surrey. We carried a hundred pounds of luggage and some extra supplies and emergency parts. We found that we needed every pound of our luggage, but did not need the parts, as we did not have a single repair on the whole trip. This is quite remarkable, since we encountered some of the worst roads in the State, as well as some of the best.

We spent two days driving about Colorado Springs, visiting the Garden of the Gods, Cheyenne Canyon, Manitou, etc. The roads around Colorado Springs were delightful and the finest we found on the whole trip. One afternoon we drove to Palmer Lake, twenty-five miles, where we stayed over night. There are a great many hills on this road, and as Palmer Lake is 2,000 feet higher than Colorado Springs, there is a considerable climb all the way. Palmer Lake is a beautiful place and we really regretted that we must make our stay there so brief.

The next morning we drove to Denver, about fifty miles down grade and fine roads. After a ride through some of Denver's beautiful parks we started at noon for Boulder, thirty-five miles. There are a good many hills on this trip, but the roads are excellent, except where we were directed over a short cut the latter half of the way. This proved to be a coal road and was

ALONG THE CANYON OF THE BIG THOMPSON RIVER.

full of chuck holes, which made progress slow and riding anything but enjoyable.

Boulder, although one of the oldest, is one of the most up-to-date and attractive of Colorado's smaller cities. The State University, the Chautauqua, and the Battle Creek Sanitarium are among the features of interest.

A night and a forenoon in Boulder and then on to Loveland, thirty-four miles, Saturday afternoon. The road to Loveland passes through some of the finest agricultural lands in the country. Almost every crop is grown here in abundance, owing to the fine system of irrigation and the prevalence of sunshine. Sugar beets are raised in such quantities that beet sugar factories are located about fifteen to twenty miles apart throughout this entire part of the State.

Sunday forenoon we drove to Estes Park over the new automobile stage road, thirty-five miles. This was the most enjoyable and the most picturesque ride on our entire trip. The road follows the cañon of the Big Thompson river for about twenty-five miles. The foaming river and the precipitous cliffs lend an enchantment that at times is not unmixed with awe. There are some steep pitches, but the road as a whole is excellent.

Estes Park is one of the newer of the Colorado pleasure resorts, but is fast becoming one of the most popular in the West.

SIGNS THAT ARE FEARFULLY AND WONDERFULLY MADE.

Its altitude of 7,500 and 8,000 feet insures a cool and invigorating atmosphere, and it is not yet blighted by the depressing effects of too much civilization. The park comprises about 8,000 acres of beautiful valleys, surrounded by pine covered mountains and traversed by streams of water that go dashing down to join the "Big Thompson" that forms the outlet of the park. Perpetual snow is in sight on all sides and "Long's Peak," the king of Colorado peaks and the goal of the more hardy and ambitious mountain climbers, is in full view and easily reached from the park. Our stay here was at the "Rustic," a most attractive inn surrounded by rustic cottages, which are for the accommodation of guests of the hotel only. The view from this place is the best in the park and is one of the finest I have ever seen.

After a few days' sojourn in Estes Park we took the return trail to Denver, which ended our tour. This time we took the shortest route out of the park, which is via the stage road to Lyons. But although this route is shorter than the Loveland route, it is so cut up by the stage and the heavy supply wagons that it took us longer to go down than it did to go up the other way. Part of the Lyons route has been improved by a new road and I understand that more extensive improvements are to be made on this line. However, the Loveland route will continue to be preferred by autoists on account of its grander scenery and its freedom from the heavy traffic which is so hard on mountain roads.

## HOW THE A. A. A. IS DOING ITS NATIONAL WORK

WHAT the American Automobile Association is accomplishing for the general good of automobiling was made substantially apparent at the quarterly meeting of the Board of Directors, held at national headquarters, No. 437 Fifth avenue, New York City, Thursday, September 18. The reports of the Legislative, Good Roads, and Touring boards told of much progress and of a kind most helpful to members and the pastime and industry as a whole. Preceded by a session of the executive committee, the full board met with the following present:

President, W. H. Hotchkiss, Automobile Club of Buffalo.  
 First Vice-President, L. R. Speare, Bay State Automobile Association.  
 Treasurer, George E. Farrington, Automobile Club of New Jersey.  
 W. K. Vanderbilt, Jr., Automobile Club of America.  
 Sidney S. Gorham, Chicago Automobile Club.  
 A. G. Batchelder, New York Motor Club.  
 Colgate Hoyt, Automobile Club of America.  
 Robert P. Hooper, Automobile Club of Germantown.  
 Paul C. Wolff, Automobile Club of Pittsburg.  
 Stanford L. Haynes, Automobile Club of Springfield, Mass.  
 W. H. Chase, Wachusett (Mass.) Automobile Club.  
 J. H. Edwards, Automobile Club of Hudson Co., N. J.  
 G. A. Post, North Jersey Automobile Club.  
 A. R. Pardington, Brooklyn, N. Y.  
 Frederick H. Elliott, Secretary.

According to the report of Secretary Elliott, the total membership of the association at the present time is 18,550—made up of 16 State associations comprising 109 clubs, 15 clubs unaffiliated with State associations, and 550 individual members. During the present administration the membership of the association has more than doubled, and the number of affiliated State associations has been trebled. Applications are expected from four recently organized State bodies in the South and West.

Provision was made for a Technical Board to which will be referred all matters of contests of a technical character.

A special committee representative of the various trade interests was appointed to consider the advisability of sanctioning track races in future. This committee, after conferring with the representative national bodies of manufacturers and with the affiliated A. A. A. clubs, will report at the directors' meeting in November. The committee consists of President W. H. Hotchkiss; Jefferson DeMont Thompson, and Ira H. Cobe, of the Racing Board; Charles Clifton, Association of Licensed Automobile Manufacturers; Benjamin Briscoe, American Motor Car Manufacturers' Association; Percy Owen, Importers Automobile Salon.

The directors approved of the position taken by the donor of the Vanderbilt Cup and the Racing Board in deciding to hold no race this year for the cup over public highways unless the course could be properly guarded by troops.

The amendments to the by-laws were adopted, providing for the annual meeting of the Association to be held in November instead of December. The fiscal year was also changed to begin November 1 instead of February 1. There will be quarterly meetings of the Board of Directors hereafter to be held in February, April, September, and November.

The Finance Committee was authorized to audit the annual report of the Treasurer for the current year and to draft a suitable financial policy for the future.

Treasurer Farrington's report showed a balance of \$6,602.14 on hand, with other assets available which will increase the total beyond ten thousand dollars. A budget for the next year, most conservatively outlined from the point of assets, showed how the organization need have no apprehensions as to its financial future. Nevertheless, President Hotchkiss enlarged upon the need of a greater revenue if the association is to accomplish quickly the extensive work that has been drafted out.

The invitation from the Springfield Automobile Club to name delegates to attend the Good Roads and Good Laws convention to be held in Springfield, Mass., September 24-25, was accepted, and the following delegates were named: Wm. H. Hotchkiss, L. R. Speare, A. G. Batchelder, Robert F. Hooper, C. T. Terry and F. H. Elliott.

The directors adopted a resolution which was recommended by the Executive Committee of the Racing Board providing that any club, a member of the A. A. A., which associates itself in any way, wholly or partially, with the promotion of a race meet shall become responsible for the delivery of the prizes as stated on the entry blank, and also for the enforcement of the rules of the Racing Board of the A. A. A.

It is proposed to hold a general convention of the A. A. A. during the touring season next year at some central point, with a program including technical contests, etc., the matter being referred to the Executive Committee.

### Exhaustive Report of President Hotchkiss.

Complete and exhaustive was the report of President Hotchkiss, a few extracts of which are herewith given:

**Legislative Board.**—By far the most important work of the Association is committed to this board, and it is fortunate in having an active executive committee and a most efficient chairman, Mr. Terry. It is perhaps proper to say, however, that it has assisted the legislative committees of several of the State associations in bringing about a better condition of motor legislation in their States during the past year. Its work has, however, but been begun, and its activities from this time on will be devoted chiefly to the passage of the Cocks bill, introduced during the closing days of the last session of Congress, and to be reintroduced at the opening of the 60th Congress in December. The whole country is being circularized and congressmen interviewed in favor of this measure. Further examination of the authorities merely emphasizes the contention that such a bill will be constitutional. Once passed, it will for the non-resident tourist do away with the most grievous provisions in many of the State laws, namely, those requiring multiple registration, licenses, and the like. I bespeak for the legislative board the co-operation of every motorist in the campaign for a federal registration bill which is now beginning. No one measure can do more good for the cause.

**Touring Board.**—The secretary of the Touring Board has, during the summer, been in receipt daily of inquiries as to roads, maps, hotel charges, and the like, and has, as promptly as possible, responded to the same. During this period, he has gathered together much valuable information, which is now being thoroughly subdivided through a filing system, and will be considerably increased during the fall and winter. This branch of the work of such board is, however, yet in its beginnings; indeed, cannot be made very productive on the limited revenues of the Association. Some of us hope that, when these revenues are what they ought to be, the Association can do for its members what other national bodies do abroad. At the same time, it must never be forgotten that foreign national bodies deal not merely with old countries, having a well developed road system, but with relatively small territories; whereas our road system is just beginning to develop, and our territory is practically continental.

**Good Roads Board.**—The most difficult task in the association is that committed to this board. Indeed, about all it can do is to co-operate with other bodies interested in the same subject. During the past few months such co-operation has not been behind the scenes, but, in the open; the time having, it is thought, been reached when the motorist can, even to boards of supervisors in agricultural territories, come out emphatically for good roads.

**Racing Board.**—Much has been said in certain quarters of late as to this board and its so-called inefficiency, particularly with regard to the Vanderbilt Cup race this year. Members of the Association who knew anything of the facts discounted the criticisms. To those who did not the following statement is due.

Every reasonable and proper effort was made to have a Vanderbilt Cup race this fall. The donor of the cup and the chairman of the racing board were determined that the race be not held unless the course was policed by troops, and they were undoubtedly right in their position. Representatives of the Association waited upon the President of the United States and asked him to permit

the use of federal troops. This he seemed entirely willing to do, if within his authority, though the gathering of sufficient troops at a central point like New York City would have been at a very considerable expense to the association. The War Department, however, intimated that our appeal should be made to the State, and the Governor of New York was then urged to promise State troops. This he was unwilling to do. An effort was then made to accomplish the same thing in New Jersey, which failed, through no fault of the active officers of this Association. While suggestions were made that, if the race was held in other States, troops could be furnished, they were either so vague in their character, or the proposed courses were so remote from our motor manufacturing centers, that a successful and well policed race seemed out of the question. Hence, the race was given up for this year.

This action of the racing board, captained by its acting chairman, Mr. Pardington, was, in my judgment, not merely wise, but the only action which could properly be taken, and were the sources of the criticisms and the somewhat questionable methods of the critics not understood by the motoring world, I should feel that such criticisms should be discussed here, and not dismissed with the contempt that they deserve.

#### Comprehensive Efforts of Legislative Board.

An enormous amount of work is being done by Chairman Charles T. Terry and his Legislative Board, a few details of which are herewith given:

With regard to the Federal Automobile Bill, your committee, with the very efficient co-operation of Mr. Elliott, has had printed one thousand copies of the proposed letter which was embodied in our last report and has sent copies of that letter to all of the State associations and to all the individual members of the three A's appearing upon the books of the association, accompanied by a particular request on the part of the secretary of the three A's that the officers of each State association take immediate action in pursuance of the letter and report back to him what they had done. Already replies have begun to come in showing the widespread interest in the Federal Automobile Bill which this association has in hand. It will be noted that it is stated in the circular letter just referred to that the association will furnish further literature to those who wish to use it, in case they are not willing to prepare further letters of their own to send to congressmen, or in case they do not care to use copies of the letter which was sent to them as above described. In order that the association may have in hand ready for distribution, as occasion may require, a circular containing the chief point of argument in favor of the bill and what points will be likely to induce congressmen to lend their aid, the chairman of the committee has prepared a letter to be addressed to each particular congressman, and sent to him, not only from the office of the three A's, but also by all the people in the respective district of each particular congressman who can be induced to take up the matter, and sign and mail a copy of such letter to their particular representative in the national body.

With regard to the Uniform State Motor Vehicle Law, your committee has redrafted it in the light of a new study of the question, and also, after consideration of all the suggestions which have been received from every source with reference to it. It is suggested that the Board of Directors pass a resolution instructing the Legislative Board to have the proposed draft of a uniform state motor vehicle law printed and distributed by the secretary of the association, accompanied by a letter from the chairman of the Legislative Board, requesting suggestions and criticisms respecting any or all of the provisions of the said proposed uniform state motor vehicle law, or in the alternative approval of it in the form in which it is distributed, so that we can get a wide expression of opinion with reference to the merits or demerits of the proposed act.

If the bill should be approved substantially in the form in which it is now drafted, we recommend that formal action be taken upon it by the Board of Directors of three A's, at its next or some succeeding meeting, and that at that time further instructions be given by the board with reference to efforts to secure the enactment of the bill in the various State legislatures at their ensuing sessions.

#### Substantial Results of Good Roads Board.

Chairman Robert P. Hooper, of the Good Roads Board, supplied a report which indicates the era of highway improvement which is dawning throughout the country.

The active work of your Good Roads Board has been transferred from the office of the chairman to the subsidiary committees which we have formed in most all the States affiliated with us. I am pleased to state to you that, through the formation of these local committees, we have succeeded in arousing enthusiasm in a number of States, not only for the interest of good roads, but

for the interest of automobiling in general, and have arranged for the formation of State associations in Virginia and in Georgia.

We are arranging now to form a Good Roads Committee in North and South Carolina. The men interested in the formation of these committees are now pushing a movement to build main highways from the seacoast through the States to Atlanta as the center point. If we meet with the success that we have every reason to believe we will, within a very short time, we will have a highway built by the States in conjunction with each other, connecting principal points in North and South Carolina and Georgia, which in itself will give an impetus to automobiling in the South such as it can secure in no other way.

Chairman M. C. Moore, in Wisconsin, reports that through the efforts of his committee they have had a Good Roads Convention in Milwaukee, at the State Fair, at which there were over 2,000 representatives, consisting of road supervisors and others interested in bettering the condition of the roads. They induced W. O. Hotchkiss, chairman of the State Geological Department, to construct a piece of good road on the grounds while the Fair was in session to illustrate to the road supervisors how the work was carried on. Already they have a movement on foot to introduce into their next legislature a liberal bill for State aid.

Frank W. Buffum, chairman of our committee in Missouri, reports that through their efforts an active campaign has begun to build a State highway from St. Louis to Kansas City, and that there is a most absolute certainty that they will be able to accomplish this within the next year, although it will of course take longer than that to build the road.

From Minnesota we have a report from our chairman, G. M. Palmer, that through the efforts of his committee they have aroused an interest in this movement all over the State, and that the farmers are actually joining hands with them in this work. Unfortunately, a large portion of the State is unable to secure the stone for road material, and they have to depend on dirt roads, but they are securing splendid results from the King road drag, and the towns are liberally coming to the front to pay one-half of the expense of working these drags to put the roads in good condition.

I could give reports like this from many States all over the country that would astonish were it possible to embody them in this short sketch of your committee, but I wish to emphasize one thing which is becoming more apparent to me every day, and that is that the farmers all over this country are at last realizing that there is a good side to an automobilist, and that with a very little work on our part we can secure their co-operation. If we can only convince them that we are willing to give our time to this work, with their interest before us as well as our own, we will have solved the problem.

There is to be a meeting of the executive committee of the Good Roads Board in New York on the 20th, to push the formation of a National Association of Associations. The work of the national body will be far more comprehensive than anything that we could expect from our own board, because of the fact that it will embrace such bodies as the National Grange, National Letter Carriers' Union, National Carriage Builders, Road Implement Association, Automobile Associations, both manufacturers and users, and in fact all bodies of men in this country that would be at all interested in the building of good roads. The purpose of the association when formed is to at once take up an active campaign to secure government aid for the building of national highways.

#### PITTSFIELD AUTOISTS TO ORGANIZE CLUB.

PITTSFIELD, MASS., Sept. 24.—As the result of an informal gathering at the Park Club last night, which was addressed by L. R. Speare, president of the Bay State Automobile Association; J. Fortescue, secretary of the Massachusetts Automobile Association; F. H. Elliott, secretary of the three A's, and A. G. Batchelder, editor of THE AUTOMOBILE, on the benefits accruing from the formation of an automobile club, it was decided to organize a local body, bringing together some 200 or more owners in the Berkshires. Dr. F. H. Brandow presided as chairman of the meeting, which chose former Mayor Daniel England, Samuel G. Colt and Robert J. Parker as a committee on organization.

#### OHIO'S AUTO LAW IS CONFUSING.

TOLEDO, O., Sept. 23.—The arrest of Harold W. Fraser, a prominent local attorney, for violating the Toledo speed ordinance will probably result in a legal controversy, the outcome of which will be of vital importance to all automobile owners in Ohio. Mr. Fraser has announced his intention of fighting the case through the court of last resort.

# THE FRICTION CLUTCH IN AUTOMOBILE PRACTICE.

By FORREST R. JONES.

ONE of the problems in automobile construction is to produce a satisfactory friction clutch for use between the motor and transmission mechanism. A friction clutch is, of course, absolutely necessary for starting and stopping a car driven by a gasoline motor, unless friction gears are used. The latter have not yet been extensively adopted.

It is very evident that it is extremely desirable to have the clutch take hold without jerking and producing heavy stresses in the transmission, or spinning the road wheels with the consequent distortion of metallic parts and injury to tires.

One needs only to watch the action of cars when starting to be convinced that many of the clutches in use do not meet the requisite conditions. There are several, however, which, *when in good condition*, act with a very fair degree of satisfaction. But the good condition is difficult to maintain, and there are frequently undesirable properties inherent in the types of clutches used. Some of the principal ones form the basis of this article.

## The Difficulty in Securing Smooth and Even Action.

The variation of the ease with which the rubbing surfaces slip over each other is one of the most serious obstacles to be met in the production of a smooth-acting friction clutch. In other words, the variation of the coefficient of friction makes it difficult to secure the desirable smooth action.

The friction surfaces which rub together to transmit the turning force from one to the other are either both of metal or one of metal and the other some substance such as leather, wood fiber, wood, etc. When metal to metal surfaces are used, they must be lubricated to prevent abrasion, cutting and scoring. It has been demonstrated by numerous experimenters that metallic surfaces slip over each other quite freely so long as a thin layer or film of oil lubricant is retained between them, but as soon as the film is broken so as to permit the metals to touch each other they develop a sudden and vastly greater tendency to cling together. If the pressure between them is great, and the speed of rubbing high, they will sometimes even weld together. This tendency to suddenly cling together is easily demonstrated by rubbing a knife over an oil-stone with oil on it and pressing the blade hard against the stone. Or by rubbing the knife, or some similar flat piece of metal, over another smooth plane surface of metal. In these examples, as well as in the clutch itself, there is generally enough lubricant retained in the minute depressions of the surfaces to prevent their serious wearing away. But this cannot be relied upon under the conditions of operation existing in the friction clutch.

When the rubbing surfaces become completely dry through excessive slipping or neglect, both of which are not uncommon in automobile practice, the coefficient of friction becomes many fold higher than that which must be taken as the basis for determining the amount of force to be used in pressing the friction members together.

The closing force must be sufficiently great to cause the desired amount of turning force and torque to be transmitted when the oil is only partly removed from between the friction surfaces. The closure spring or springs, commonly used in automobile clutches, must be set to exert a clutch-closing force great enough both to squeeze most of the oil from between the friction surfaces quickly so as to transmit the maximum uniform torque of the motor while the surfaces are still well enough lubricated by the remaining oil not to abrade when slipping over each other.

The thickness, or, more correctly, viscosity of the oil varies with the temperature. In cool weather, when the oil is more viscous than in warm, the clutch will not take hold as quickly as in the warm weather, because the thicker oil squeezes out more slowly. Even when the atmospheric temperature remains con-

stant, that of the oil and friction parts is raised when there is much slipping, as when driving through a crowded thoroughfare or over bad roads where frequent variations of speed are made.

Under the conditions mentioned, metal to metal friction clutches are liable to grip suddenly and hard on account of the surfaces coming into closer contact than usual, even to the extent of abrading and scoring.

## Leather Facings and Other Non-Metallic Materials.

Leather-faced cone clutches, and those using other non-metallic materials for one of the friction surfaces, are subject to the same idiosyncrasies in a general way. When the leather is properly prepared and new, the coefficient of friction between it and the metallic surface is fairly constant and the clutch behaves well. But the heat generated by the slipping which must of necessity occur when starting and changing gears ultimately burns and chars the leather so that it loses its elasticity and also causes a variation of the gripping capacity. This is not the most serious factor to deal with, however. The most undesirable and troublesome feature is getting oil on the friction surfaces. This is hardly preventable in automobile use. The oil causes the clutch to slip easier, especially when the parts have been somewhat warmed by starting the car, etc. The closure spring must be set harder to meet this change of condition. This, in itself, is not seriously objectionable. Unfortunately, however, the frictional resistance is not by any means the same when the surfaces are cool as when warm, as has been already stated for metal to metal surfaces. After the car has been standing some time, or running without slip in the clutch, the gripping capacity becomes greatly increased when the leather is oily. This often manifests itself very decidedly, sometimes even to the extent of breaking some part of the transmission system when the clutch takes hold instantly so that the inertia of the parts suddenly set in motion, in conjunction with the resistance of the road wheels to slipping, offers a resistance in excess of the strength of the parts.

Cork is not so seriously affected by the frictional heat of slipping as leather. Its elasticity remains practically unchanged.

Fig. 1.—Cone Clutch.—When the driving shaft and outer cone are rotating, and the inner leather-faced cone is brought into frictional engagement with the outer one by gradually reducing the releasing force, the pressure is increased between the outer and inner members of the square connection to the transmission shaft by the action of the torque. Considerable longitudinal force is necessary to slip the outer square forward over the inner one. When the slipping at the square joint starts, the parts jump forward suddenly because much less power is required to keep the parts slipping than to start them, and, as a result, the pressure between the cone surfaces is suddenly increased to an extent sufficient to cause the clutch to jerk. By enlarging the square joint, the resistance to longitudinal slipping between the inner and outer squares is reduced, but it cannot be eliminated.

Fig. 2—Multi-Disk or Multi-Ring Clutch.—As the releasing force is reduced the hub and its abutting flange forces the disks toward the right so as to bring them into contact. As soon as they press against each other when the driving shaft is rotating, and the driven shaft is stationary or rotating at a different speed, generally slower, the frictional turning force acting on each disk causes it to press against the ribs, which prevent its turning in the shell, or on the drum, as the case may be. The frictional resistance to sliding along the ribs is approximately proportional to the turning force acting on each disk. The force necessary to move them when working up to nearly full capacity is considerable. The pressure for moving the disks must all be transmitted from the hub flange to the disk next it, and that disk transmits it to the others, all but what it takes to move it along the ribs, and so on, with a gradual reduction of pressure between each successive pair of disks to the drum flange. As a result the left-hand disk does more work than any other when closing the clutch. When it begins to slip along the rib it starts the others, and they all are suddenly brought to bear harder against each other. The result is a jerk. By increasing the diameter of the friction rings, both inside and outside, and decreasing their number, the jerking action can be reduced. This magnifies another seriously objectionable feature, however, in automobile use, namely, increase of inertia of the parts of the clutch that are attached to the transmission shaft, connecting to the speed change gears.

Oil and grease, however, are objectionable factors that must be contended with in its use, as they change its character totally.

The ready compressibility of cork and the use of springs under the clutch leather both act to reduce the liability to sudden gripping.

#### Friction of Rest Greater Than That of Motion.

There is also another cause of gripping inherent to the usual types of cone and multi-disc clutches. In these types of clutches the closure and release are effected by moving the friction parts in a direction parallel to the axis or shaft of the clutch. In the cone clutch, the shifting cone member slides along the part with which it engages to transmit the torque to the transmission. The sliding of the clutch member over that of the transmission is accomplished while there is considerable pressure between them due to the torque transmitted. This pressure is proportional to the torque. When closing the clutch the shifting member reaches its final position by a series of quick, short movements, with full stops between them from the time the friction surfaces first touch each other, as the pedal or hand lever force is gradually released. This is in accordance with the well-known law that the friction of rest is greater than that of motion. It applies here to the sliding motion of the shifting member over the transmission part. This action causes sudden, intermittent increases of pressure between the friction surfaces and corresponding variation of the torque. It is in counteracting this jerky sliding that the elasticity of the cork or of the springs beneath the leather is beneficial.

In the multi-disk clutch the disks must slide along the feathers, ribs or bars that support them as the clutch closes. There is considerable pressure between each disk and the ribs which prevent its rotation from the time torque begins to be transmitted until the clutch is in complete engagement. The same series of intermittent movements parallel to the clutch shaft occurs here, as in the cone clutch. Various methods of counteracting the effect of this uneven motion, and for forcing the disks apart to release the clutch, have been put into use. The chief ones are the use of springs between one set of disks or crowning the disks themselves. It is clearly evident that such devices can only mitigate, but not eliminate, this undesirable feature.

The injurious effects of the sudden seizure of a clutch are not generally immediately noticeable, except in such extreme instances as the breaking of some part and the well-known injury

to tires. A gear is sometimes stripped of its teeth, a chain snapped, the jaws broken from a positive clutch, a shaft bent, or a coupling torn apart. All these have come under the writer's notice in different forms at one time or another.

#### Destructive Results of Jerky Gripping, and a Remedy.

The more usual result of the gripping, aside from destruction of tires, is injury to some of the parts, which takes some time to develop. Thus, when ball bearings are used in the transmission, the extremely high pressure, or overload, brought upon them by the jerk, injures the surfaces which bear against the roll over each other. This injury does not manifest itself immediately, but after a time a flake of metal will loosen from the surface of the ball or race. After this occurs, deterioration is rapid, and complete destruction soon follows. The same is true of hardened gears. The sudden strain distorts the supporting parts, for all materials are more or less elastic, and causes the pressure between the intermeshing teeth to become localized at an end or a point of the tooth. The material is thus overstressed locally and, as with the ball bearing, a flake will be worked loose after awhile, and the rough surfaces, as well as the loose flake itself, begins its work of destruction. Keys, pins and feather keys used to transmit torque from one part to another are worked loose, and, when play backlash is once established, the shock of parts bringing up against each other works their destruction.

The remedy up to this writing has been to make the transmission parts much stronger, and consequently heavier, than would be required if the clutch could be closed with certainty that the torque could never exceed a certain accurately predetermined amount. This amount would naturally be taken about the maximum that the motor is able to develop on a steady pull, as when ascending the steepest hill the car can climb.

Such a clutch has recently been constructed and thoroughly tried out over hundreds of miles of bad and hilly roads, with gratifying results. The writer hopes soon to have the privilege of presenting to the readers of THE AUTOMOBILE a description of it, together with a history of the road trials and laboratory tests.

In the turning force or torque is transmitted through a large number of small springs of the simplest form, each of which takes its proportionate share of the load. At a predetermined deflection of the springs the pressure between the friction parts is reduced and they are allowed to slip over each other while still transmitting the predetermined maximum torque. Oiliness or dryness of the friction surfaces does not appreciably affect the maximum torque. The elasticity of the springs also prevents shock and hammering of the transmission parts.

#### JERVIS ON A FUTURE PHASE OF THE INDUSTRY.

A. N. Jervis, one of the publicity experts of the Licensed Show, has the following in some of his recent press matter:

"It was natural enough that in producing a motor vehicle the motor should be first placed in the ruling type of carriage and that the shaftless buggy should be the pristine automobile form. It is natural again that when the demand arrived for the lowest-priced motor vehicle possible, the automobile engine and driving mechanism, having been developed to a high state of efficiency and reliability through the building of heavy and powerful cars, should be found adaptable in their advanced forms to the primitive type of horseless carriage. It seems now probable that this revised pattern of motor-driven buggy, minus hills, appealing to the greater number within whose means it comes, will outnumber in a few years all other forms of automobile."

#### RARITAN BRIDGE OPEN AGAIN OCTOBER 1.

PERTH AMBOY, N. J., Sept. 23.—The long constructed bridge over the Raritan river, connecting Perth and South Amboy, will be thrown open again to the public October 1. It has been in process of repair during the entire summer.

A "STABLE STREET" IN NEW YORK.

In the foreground are the modern private garages of Payne Whitney and the late Randolph Guggenheimer, East Sixty-sixth street.

WITH buildings rising as much as forty stories above the ground and with cellars, subcellars, and sub-subcellars under the ground, with subways ramifying in many directions and tunnels criss-crossing in the depths below, the Island of Manhattan is becoming a very concentrated piece of real estate on which every square foot is expected to do its full duty in the way of supporting rental values. Given the ground valuation, the highest rent obtainable and the cost of construction by which this highest rent may be realized, it would be a question of precise mathematics to determine how many stories there should be erected on a building lot, if only the conditions existing at the time the calculations were made could be guaranteed to be permanent. But they are ever-changing and hereby the philosophy of real estate operations and building operations becomes very much more complicated. Changes in population, in industries, in commerce, and in politics are to be considered.

As far back as 1868 the advent of the elevator began to change the possibilities for high structures radically. Subsequently structural iron, working hand in hand with improvements in fireproofing methods, introduced new factors, which in turn became subject to varying estimates, according to fluctuations in the prices of iron and steel and of labor. Modern concrete and iron construction has again brought modifications. The natural conservatism of boards of underwriters restrains the skyward movement of buildings, and then suddenly, by the rescinding of old rulings or the passing of new ones, releases it.

Were it not for all these changing factors and the unequal opportunities for procuring capital as well as the varying estimates of what the future may bring in rise of values, it should be an unusual thing to see low and

probably erect buildings of a more ornamental character than those usually seen, which reflect little credit on their sense of luxury and elegance, if their choice were not in reality dictated to them and mostly due to some special difficulty in getting revenue from property including a private stable or garage.

This special difficulty is easily traced to the unalterable objection which particular people entertain against the idea of "living over a stable," especially if that stable is not their own. Throughout the movement which has sent buildings up high over the ground which they occupy, this objection, well founded upon the odors and flies that accompany horse establishments, has been strong enough to neutralize all effects of rising values and improved building methods in those residence districts where private stables or garages must be located to the extent of render-

lofty buildings side by side in New York and other large cities. As a matter of fact, however, towering apartment houses and hotels and stately dwellings alternate with insignificant and lowly structures, largely stables and garages, in some of the best parts of the city where the ground valuations are apparently so well established that it should be easy for the owners to obtain better returns than the low structures referred to can yield.

"Those stables and garages belong to rich men who do not care for returns, and who, in fact, would not consent to have their property used for any other purpose than their own or occupied by any other persons than their own coachmen and chauffeurs," some real estate men say, in explanation. Others admit that the reason lies more deeply in the conditions, and that owners who so greatly appreciate the luxury of maintaining a stable or garage wholly and exclusively their own would

EARLY ATTEMPT TO COMBINE PRIVATE GARAGES AND APARTMENTS ON EAST 75TH ST.

#### AN ARTIST'S STUDIO SURMOUNTS THIS PRIVATE GARAGE

This garage, which is located at 109 East Sixty-third street, is the property of Mr. Blair. Brownstone dwellings in background remodeled for garage purposes.

ing almost one-half of this area is, in a measure, unprofitable. Modern sanitation in stable buildings and improved methods in the care of horses have removed some of the reasons upon which this extremely costly objection against living apartments over a stable is founded, but the objection continues to live partly because the reasons for it are not everywhere removed and partly as a matter of tradition and of pride, and, by a natural association of ideas, it has even been extended to apply to living apartments over a private garage, so that it is practically impossible for the owner of a lot, which must be used for either stable or garage purposes on the ground floor, to figure upon obtaining the rents which the neighborhood should justify from any living apartments that he might arrange in other portions of the same building. And, were he to arrange apartments on a cheaper scale, then he would draw in an undesirable class of tenants to an otherwise desirable neighborhood, which is the very most effective method for lowering the tone and the values in that neighborhood in general.

#### Insurance Regulations and Popular Prejudice a Hindrance.

Insurance regulations, according to which any stable or garage property must not be occupied for residence, including cooking and housekeeping by more than one family, or at all, under penalty of prohibitive insurance rates, or unless fireproof construction is adopted, have also contributed to keeping such properties down to one, two, or at most three, stories, and those usually of ungenerous architecture and dimensions, the owner being actuated by the idea that the less valuable the improvements of the place, so long as it brings no direct revenue, or none commensurate with the value of the ground, the better is his chance for disposing of it at a profit as soon as a further rise in values shall make such a sale advisable.

Naturally, it has not escaped all observers that the good and sufficient reasons which in the first place created the objection against living over a stable are in reality wholly inapplicable to living over a private garage, unless the latter is conducted in an extremely slovenly manner or the living apartments are laid out

as if only persons of very humble demands upon the comforts and amenities of life could contemplate occupying them. Many understand perfectly well that a modern many-storied building with a private garage occupying the greater portion of the ground floor may be made intrinsically more desirable for residence purposes, either for a single family or as an apartment building, than if that same ground floor constituted an apartment or were rented for a physician's or a real estate man's office or for a store; and they realize—architects and owners among them—that some of the so-called "stable streets" might be transformed into rows of profitable residential buildings without surrendering any of the accommodations they now afford for housing the modern means of transportation—the automobiles—were it not solely that nobody dares to undertake this innovation in localities where rents should be high, for fear of running afoul of the still surviving popular prejudice, among those who are able to pay high rents, against "living over a garage."

It remains for the press to abate this prejudice as rapidly as possible and thereby to contribute not only to the readier and more convenient housing of automobiles, and incidentally to the more extensive sale of them, but also to the more systematic caretaking, cleanliness and precaution against fires which will be compulsory in such buildings as here contemplated, and to the erection of fine, monumental structures in localities which are now anything but attractive, though cheek by jowl with the most elegant residential quarters of the city.

The garage arrangements in the new Automobile Club of America on Fifty-fourth street and the vestibule in the Home Club on Forty-eighth street bear testimony to the perfect compatibility which exists between home surroundings—which do not differ greatly from club surroundings in character—and garage facilities, if the latter are properly understood as not including that machine shop equipment, with hammering and noise, which was considered necessary in the probation days of the automobile.

#### Architects Beginning to Appreciate the Situation.

Among the younger architects several realize that the automobile is destined to become one in that series of engineering developments—the elevator, structural iron and concrete construction, electrical progress, the telephone, the use of small engine power, etc.—by which their profession has been well-nigh revolutionized and by which new chances for earning distinction in that profession have been opened for those who prove capable of properly gauging the rights of the new against the rights of the old. They know that much which is old in the building world need not necessarily be profitable and well-considered, but also that anything new they may propose to an owner of real estate in the way of a building venture must offer almost positive guarantees of profits above the ordinary; and with this condition in view they consider it the part of wisdom to make haste slowly in planning the incorporation of the automobile garage in large structures intended to yield a profit as high-class residence property. They know the strength of the prejudice which is the main subject of this article, and they know how slowly it will die, though die it must.

On the other hand, some of them are aware that there is at present an active demand for what is known as studio-apartments, not only among artists but a demand extending to thousands who have no professional use for the very large room, or rooms, with high-light or skylight arrangements which constitute the distinguishing feature of this class of living rooms; and these architects seize shrewdly upon this fact as one which affords the desired opportunity for rebuilding the obnoxious stables or garages on a plan that should prove profitable to the owners and creditable to themselves, it being an admitted supposition that the particular class of people who desire studio-apartments are least influenced by social prejudices or traditions, while willing to pay a rent proportionate to the real qualities of the houseroom offered them.

This seems a pretty solution for the temporary deadlock between the old prejudice against stables, which has been so thoughtlessly paraphrased as to include private garages, and the natural desire for enlarging the good residence zone of the city while also catering to the ever-growing demand for garage facilities in the immediate vicinity of those who own the automobiles.

The architects of the future have in mind buildings of considerable size and many stories, such as have not yet been materialized in practice, but an example on a smaller scale of the combination of private garage and artists' studio may be seen at 109 East Sixty-third street, a garage belonging to Mr. Blair, a banker, and of which the top floor is occupied as a painter's studio, while the second floor, as usual, affords living-quarters for the chauffeur and his family.

#### Where Some of the Modern Private Garages Are Located.

Among owners of automobiles and of horses there seems to have been a very general appreciation of the anomaly in occupying expensive lots with low, hideous and unprofitable stable or garage buildings, but in the face of the prejudice referred to they have accepted a compromise solution. They have sought localities where lots were less high priced, such as the vicinity of Lexington avenue, and where the influx of a less pretentious class of residents gave promise that nicely appointed rooms over a garage, or even over a neat-appearing and neatly-kept stable, would not be despised, and here they have erected structures of two, three or four stories, which, though probably not profitable, are at least a credit to the neighborhood in which they are placed. As a rule they are fireproofed, at least as this phrase goes, and often they are distinctly ornamental.

In this latter class the garage building on Sixty-sixth street, near Lexington avenue, of which one part belongs to Payne Whitney and the other to the Guggenheimer estate, is prominent, but apparently no idea of deriving any revenue from it has been entertained. Generally it is true that the costlier the building the less evidence does it present of any desire to rent any part of it out. Such buildings as the large garage on East Seventy-third street, between Lexington and Third avenues, belonging to ex-Mayor Grant and his friend, Mr. Brady, where some fifteen automobiles are housed, and Mr. Pulitzer's stable and garage on the same street, are interesting examples of automobile garage and stable architecture, but have little to do with the present subject. On other streets in the same vicinity, however, on East Seventy-sixth, Seventy-fifth, Seventy-fourth, Sixty-sixth, Sixty-third, between Lexington and Park avenues, and on East Sixty-second, between Park and Madison avenues, a number of garages are observed in which the upper stories are occupied by tenants other than the chauffeurs or caretakers.

#### Exterior Appearance a Necessary Adjunct to Success.

But, throughout, the step of bidding for tenants has been taken only falteringly, except in one instance which is illustrated in an accompanying photograph; and in this instance a failure has evidently been scored. The building is four stories high and contains four would-be garages, one of which is occupied by a blacksmith and another by a carpenter, and a large sign announces that the living-apartments above are for rent for business purposes. The history of the building has not been one of economic success, since it was erected some eight or nine years ago by one more foresighted than cautious; but there is evidence that the fault may lie largely in the architecture, and indeed it would have been remarkable if at that early day the true requirements for garages and for living-apartments above them could have been even approximately foreseen, considering that at this very day only the most progressive architects have begun to work out the various problems which these requirements involve, on the drawing board, and are just learning to understand what errors have been committed by the few who during the past years lightly undertook similar tasks.

**GARAGES AND STABLES WITH LIVING QUARTERS ABOVE THEM.**

These buildings are located on East Sixty-second street, between Park and Madison avenues. In the foreground is shown O. F. Thomas' private garage.

Two points relating to the exterior appearance of such buildings have been made clear. They must not conform with stable architecture; that is, the entrance to the living-apartments must not be slighted in comparison with the entrance to the garage, and the windows must not be low and humble; for a private house the entrances may be combined, as in the house erected by the architect of the Automobile Club for himself at 109 East Fortieth street; but, if apartments are to be rented, all assertion of prejudice must be forestalled by a liberal use of those architectural embellishments which proclaim the dignity of a house intended primarily for human habitation. Human pride rebels against any direct or implied subordination to either automobiles or horses, and can scarcely be blamed. The two entrances must be at least equal in artistic elaboration and in this respect it is fortunate that the automobile does not require as broad an entrance as carriages drawn by horses. A barely completed stable-garage on East Fifty-third street shows two coordinate entrances, designed on this plan; but richer suggestions are supplied in some of the old French houses from the middle ages, some of which those who have toured in the *chateau* region of France will have noticed.

The other point referred to relates to the equipment of the garage. It has become evident that the larger the investment which the building represents in which it is located, the more thoroughly it must be fireproofed and provided with all the scientific facilities for storing of fuel, cleaning of vehicles and floors, electric charging of batteries (or at least the wiring for it), so that it may under all circumstances represent a current rental value, even if the man who has it planned for his own use should decide to abandon it for any reason which may arise in the course of human events. New York affords more than one striking illustration of the errant perversity of fortune in failing to smile upon real estate improvements of a special character in connection with the automobile, even where the conditions involve no such phases as are presented by the problem of profitably combining garage and living accommodations which now confronts many a metropolitan architect.

## INFLUENCE OF ACID AND RUST ON BALL BEARINGS\*

By HENRY HESS.

**M**ANY of the members of this society have a decided interest in the integrity of ball bearings, some because they ride in cars mounted on them and do not want to add to the revenues of the medical profession, because a bearing gives out—others because of this and also because their kindly souls are grieved when they hear of mishaps to the users of their cars, not to speak of the pain experienced from demands for replacement.

EFFECT OF ACID AND RUST ON BALLS AND RACES.

Now, I am in a position to know fairly well what troubles develop with ball bearings, since my company supplies them, and since every chap who has a grievance registers his kick with us. I find the chief causes of trouble to be dirt, rust and acid. Pretty nearly every one to whose attention grit and rust are drawn will recognize and acknowledge their presence and agree that it cannot be considered anything but harmful. But when acid damage is referred to, that is met with an incredulous stare if not a downright denial of its possibility, and a request to be told where acid could possibly come from.

To those familiar with lubricants the thing is not so mysterious. I remember very well an occurrence of years ago, when I was building machine tools, and was interested in ball bearings only because those in my bicycle either always wanted a new ball or taking up or something. It so happened that a

\* Paper read before the Society of Automobile Engineers, Buffalo, July, 1907.

certain machine was set back for some more urgent job. On taking it up again the main spindle journal was found to be badly scarred with deep, irregular channels and pits. Wild theories of the existence of a new bug that thrived on steel were propounded, but the solution was much simpler. The bug was found to be a combination of waste, acid oil, and heat to make the acid action more energetic. The next lesson in lubrication I received when building some heavy motor-driven, high-speed lathes, having a steel-worm driving a bronze gear with the combination immersed in oil. Deposits of copper were found on the worm and other steel parts. The obscure occurrence was found to be due to acid in the oil bath and a slight current leakage combining to form an electroplating bath.

The two races and the series of balls that I have circulated were recently returned by one of our customers. They constitute a beautiful example of the action of an acid lubricant. The balls are irregularly etched on their surface. The races are similarly etched. There are also transverse discolored bands that are slightly etched in the ball tracks. These correspond to the positions of the separator end plates, and show that the machine stood for some time. It is a peculiarity that acid acts more energetically where the metal surfaces are in more intimate contact. This is probably because the small space acts by capillarity to set up a slight current to always draw from the adjacent masses a fresh supply of unspent acid lubricant. Now, it is a very fully demonstrated fact that the life of a ball bearing is proportional to the perfection of the surfaces of the balls and races. Poor finish means short life; acid pockmarks are not only symptoms of a serious ball-bearing disease, but in themselves cause its early demise. That acid lubricants do produce these symptoms is clear enough from the parts exhibited.

The remedy is the use of lubricant that is neutral and that will remain so. There are many such to be had, some at high, and some at reasonable prices. It does not follow that a costly lubricant is free of acid taint. In general the mineral oils are best. Animal or vegetable oils are to be avoided; though they may not contain free acid when bought, they are fairly certain to develop it under suitable conditions of exposure to heat, sunlight, etc. The best test that I know of is to take a piece of brightly-polished clean steel, wrap around this heavy threads from waste thoroughly soaked in the lubricant under test, and expose this to the sun's rays in some fairly warm place. Suitable oil or grease will show no etching, even after months of exposure. In bad cases the oil will stand convicted after a few hours or days, or at most a week or so.

## AUTOMOBILING'S RAPID STRIDES IN CHINA

Referring to his previous report on the introduction of automobiles into the colony of Kiachow, China, Consul Wilbur T. Gracey, of Tsingtau, submits additional information. He says:

In continuation of my report published in Daily Consular and Trade Reports on May 2, 1907, it is interesting to note remarks in regard to automobiles in Shanghai, which appear in a recently published report by the Commissioner of Customs at that port:

There is also some idea of supplementing the tramway by lines of motor omnibuses. One of the alternative schemes to the tramway, and one which was strongly advocated, was to have no tramways at all, but lines of motor vehicles. This scheme was negatived, mainly, upon the hypothesis that the native could not be trusted to become a reliable chauffeur. Curiously enough, the reverse has proved to be the fact, and no modern invention has developed more rapidly in Shanghai, or contributed more to the expansion of the town, than the motor industry. Garages and

repair shops are springing up in all directions, and the large number of valuable motor cars and motor boats, all of which are most of the time solely in charge of the native chauffeur, would strike any newly arrived Occidental as exceptional anywhere. Many wealthy natives have acquired cars, which they drive themselves at times, while enormous motor vans, used by firms which have their godowns far removed from their office, the municipal council's new motor chemical fire engine, etc., all prove how welcome and serviceable the new industry is in this flat country. It is even suggested that a good road along the river bank to Woosung, which might be easily made owing to the existence of a dike which would only need widening from the river side, would do more to promote the expansion of Shanghai than the projected road to the hills. The latter proposal would be very expensive.

Shanghai is the only other port in China, besides Tsingtau, where automobiles can be used with any success. The roads are excellent macadam and run for twenty miles into the country.

## LETTERS INTERESTING AND INSTRUCTIVE

### WHY IS THE TWO-CYCLE NOT POPULAR?

Editor THE AUTOMOBILE:

[910.]—Will you kindly inform me through "The Automobile" what the general objection is to the two-cycle engine. I have read all kinds of criticisms—mostly against this type of engine—but I have yet to find a user of an Elmore car that is not an enthusiast. I have been operating all kinds of cars for the past six years and I now own a three-cylinder Elmore, which I have had for some time. I have been trying hard to find some objection to the engine in my car and the more I try to find some faults with it the more I am convinced that the four-cycle engine is not in it. It is the most perfect running piece of machinery I have ever seen.

Will you please inform me why this type of engine is not more in use? Is it on account of patents or on account of ignorance? It is certainly the most simple engine made and the power it develops is a revelation.

CHAS. J. CHABOT.

Dallas, Tex.

We are not aware that there is any *general* objection to the two-cycle motor in the sense that there is a popular prejudice against it, as such is not the fact. If other makers were to take up the construction of a car with a two-cycle motor and push it energetically there would be a far greater number of this class in use. As it is, the average manufacturer realizes that it is much easier to sell a four-cycle car than a two-cycle, simply because the public has not been educated to the latter. The man in the street most frequently buys a certain make of car because a friend of his has one or recommended it, and as two-cycle cars are greatly in the minority, they do not get these recommendations as often as they would were the case otherwise. Under existing circumstances it is necessary to make a convert to the two-cycle principle every time a car is sold, and while an intending purchaser may be convinced of the superiority of the two-cycle owing to its simplicity, he cannot reconcile this and the fact that there are so few in use, comparatively speaking. It is extremely difficult to overcome the inertia and conservatism of the buying public. Technically, the objection to the two-cycle engine is that it is not as efficient as the four-cycle, owing to the fact that the incoming charge is always more or less diluted with the burnt gases of the previous explosion, and a portion of the fresh charge also seems to escape through the exhaust before the closing of the latter port. These faults are such that they should have little or no weight with the average buyer, for so far as the everyday user is concerned, they are doubtless counterbalanced by the disadvantages of valves and their mechanism in the four-cycle engine. It is simply because the makers find it easier to sell four-cycle machines and prefer to work along the line of least resistance.

### CHANGING THE CARBURETER ON A RUNABOUT.

Editor THE AUTOMOBILE:

[911.]—I am the owner of a 1906 runabout, and have been troubled considerably with my carbureter, which is of a very simple pattern, and made by the manufacturers, but while it was very good for a time, it has now become shaky in several parts, and doctoring does very little good. I propose substituting a Schebler, and, with this end in view, wrote Wheeler & Schebler, who recommended putting in a one-and-a-quarter-inch size, but a local mechanic tells me that this size is unnecessarily large, and that a one-inch would be the proper size. If you know anything about the matter, also the possibility of obtaining ready-made fittings for making the connections, wish you would write me, and oblige a subscriber.

C. F. H. v. BLUCHER.

Corpus Christi, Texas.

We believe that you would be well advised to adopt the one-and-a-quarter-inch size carbureter in preference to a smaller model. You should have no difficulty in fitting this carbureter in place of the one now employed; the present piping may be used again, and we believe that the necessary unions are supplied as a part of the carbureter. If not they can be obtained from the maker at a slight additional charge.

### TO INCREASE THE POWER OF A 1905 CAR.

Editor THE AUTOMOBILE:

[912.]—Will you please let me know through the "Letters Interesting and Instructive" column of "The Automobile" if it is possible to increase the power of engines in a four-cylinder Ford touring car, 1905 model? I intend to enlarge the exhaust pipes and make larger openings into same. The exhaust pipes are very small. Would it be advisable in my case to increase the initial compression, and would you advise me to increase size of valves?

Erie, Pa.

W. C. S.

It would probably be possible for you to slightly increase the power of your engine by increasing the compression a little. We should not advise you, however, to touch the valves. Before making any changes it would be advisable to look to your piston rings and see that you have the maximum compression with motor in present condition. Unless the compression is exceptionally low it would be better to let well enough alone. Enlarging the exhaust openings would not be worth the trouble involved. If, as you say, the pipes are exceptionally small, you might get rid of the exhaust more quickly and thus cool the engine better by enlarging them, but we should not advise you to make any change in the present opening. You can experiment for yourself what the probable effect will be by noting carefully the performance of the car on some hill in its present condition, and running it over the same ground several times with exhaust pipes off.

### ABOUT CELLULAR AND TUBULAR RADIATORS.

Editor THE AUTOMOBILE:

[913.]—I am an interested reader of "The Automobile," and solicit information. Will you kindly publish in your "Letters Interesting and Instructive" whether the cellular or tubular radiator cools more effectively, which is the heavier, which is the most preferred, and why?

Philadelphia, Pa.

P. M. F.

Generally the cellular or honeycomb radiator, by exposing a larger cooling surface to the air within given external dimensions, cools more effectively. So much depends on the material and workmanship that it is impossible to say emphatically which type is the heavier; probably if weights were obtained of half a dozen different makes of each type it would be found that the tubular radiator weighed a little less than the cellular type. As to which is most preferred is a matter of opinion. Although the cellular type gives the maximum of cooling area in the minimum of space, it has the disadvantage of being more delicate of construction. A good cellular radiator is all that could be desired, but a poorly constructed one is an eternal pest. The good points of the tubular radiator are its simplicity and ability to stand rough usage.

### QUESTIONS CONCERNING A NORTHERN.

Editor THE AUTOMOBILE:

[914.]—I have a Northern two-cylinder touring car and would appreciate it if you could throw some light on the following:

1. When the throttle and spark are advanced beyond a certain point, the engine seems to choke and slow down. This happens when the levers are advanced beyond the three-quarter point; that is, three-quarters of the whole distance. Otherwise the car runs very well.

2. When I start the motor up after it has been standing for half an hour or so, it only fires on one cylinder for about twenty revolutions. Then they both begin working. Why is this?

3. If I ran a pipe from the carbureter air-intake to the outside of the exhaust pipe so that warm air could be taken into the carbureter, as shown in the drawing, would it make the motor run any smoother?

Chicago.

A READER.

1. This is probably due to failure of the auxiliary air inlet to work beyond the point you mention. Up to that point it increases the supply of air in accordance with the speed of the motor, thus keeping the mixture uniform, but when the three-quarter point is passed, the valve either cannot open any more, or its full opening is not correctly calculated to supply the proper quantity of air

for the maximum speed and power. Doubtless you will find the former to be the case, some obstruction preventing the full opening of the valve. A test of the nozzle adjustment to verify the latter and find out if the proper amount of gasoline is being fed might also be beneficial. As the engines and complete chassis are thoroughly tested out before being passed at the factory, the trouble is very much more apt to lie in a lack of adjustment.

2. It would seem as if but one cylinder received a supply of fuel until the motor was warmed up a bit. The foregoing reply will be found to apply to this. See if the carbureter is properly adjusted in every way and doubtless the trouble will disappear.

3. It will doubtless be found an advantage to fit a warm air pipe such as you mention. We should not recommend a piece of rubber hose for the purpose, however, but rather a metal tube which can be equipped with a cut-out as is done on many cars.

### WHY THE SELDEN PATENT HAS NOT EXPIRED.

Editor THE AUTOMOBILE:

[915.]—Will you kindly explain through "Letters Interesting and Instructive" why the Selden patent has not expired, as I understand it was secured in 1877.

F. W. O. & S.

Nyack, N. Y.

The Selden patent, which bears the Patent Office No. 549,160, was not secured in 1877, as you presume by your letter; in fact, the application for the patent was not filed until 1879. Proceedings in the Patent Office delayed the issue of the patent until November 5, 1895. As patents are issued for seventeen years, it has still five years to run.

### ONE MAN'S EXPERIENCE IN THE INDUSTRY.

Editor THE AUTOMOBILE:

[916.]—I would like to answer Letter No. 892, on page 359, issue of September 12, 1907, in which he asks advice about entering the auto business. My advice to him would be to stick where he is, to work faithfully and honestly for his employers, and he will be better off than if he undertook to learn the auto business, notwithstanding that same is still in its infancy.

My reason for making the above assertion is based on personal experience and observation, and can be substantiated upon investigation. Personal experience covers more than twelve years, engaged in various departments of the gas engine and automobile industry, with excellent references from such companies as I have been engaged by. I am and have been unable to obtain a position since the trustees of the company, of which the auto department was a part, decided to close same, owing to financial difficulties of the head of the concern.

I have written to more than a hundred companies in the industry; have less than fifty replies, in which they answer that they will file my application; the others did not even offer to do that much; I have answered one "ad" for a position as traveling salesman (same has appeared eight times in your magazine) five times, also others, and have never received one answer to any of them; my experience, technical knowledge, ability, etc., fully qualify me for such a position.

As excellent an authority as Mr. Reeves, the general manager of the A. M. C. M. A., has recognized my qualifications as above and has placed my name at or near the top of the list kept by the employment bureau of the association. Concerns having my name on file must have lost the file, as every once in a while I see in "News and Trade Miscellany" that so and so has gone with this or that concern.

In the New York "Herald," issue of Sunday, September 15, there were fifty-five "ads" of positions wanted by chauffeurs and repairmen, and two "ads" of help wanted in the last issue of your magazine. There were fifty-five men who advertised for positions, covering every department in the automobile industry, and thirty-four "ads" wanting help, of which fifteen were operators, or actually nineteen concerns needing help.

Graduates are being turned out by the dozens, diploma, license, and recommendation for \$25. They even offer positions, paying \$100 to \$150 per month for their graduates. I tested out last winter more than twenty men, who had made applications for positions as demonstrators and salesmen, and did not find one worth \$40 per month, let alone \$150. Nearly every one in the trade can give you many instances where cars have been ruined by ignorant chauffeurs and mechanics, and the upkeep of most cars is from 10 to 25 per cent. higher than it should be owing to grafting done by these same graduates.

Mr. Words, the industry has not as yet settled into its proper place, and, even if it had, it would take from three to five years to properly learn same, as it covers more than one department of mechanics. I have made it a close study for years in the various departments and am still a long way from knowing it all. Stick at what you are now doing, faithful and honest service will be appreciated by your employers and your compensation will probably be as great as it would be in the auto business.

New York City.

EXPERIENCED.

### PAUL LACROIX DIDN'T DRIVE SELDEN '77 BUGGY.

Editor THE AUTOMOBILE:

[917.]—I have just seen in your issue of September 12, page 353, a photograph of myself and Mr. Lamberjack in a car designated: "The Original Selden Gas Buggy." The last paragraph of the article, which is entitled "Selden '77 Buggy Proves Its Practicability," reads as follows:

"There were many interested witnesses who were surprised at the showing made by the old buggy, not the least being Paul Lacroix and E. Lamberjack, of Paris, who saw the car in operation for the first time. They were also given an opportunity of testing the weight of the claims of its backers with regard to its running powers by getting in and running it themselves."

In view of the fact that I am engaged in the sale of cars manufactured by Renault Frères, your article places me in the position of a person who, while he repudiates the validity and the practicability of the Selden patent, is surprised at the good performance of a car claimed to have been built in conformity therewith.

It is true that on Friday, September 6, Mr. Lamberjack and myself saw the car known as the "Selden gas buggy" on Forty-ninth street; it is also true that we sat in such car so that the photograph might be taken. When we did so we had no idea that such photograph would be used for an article such as that in your paper; neither had we any idea that the photograph would be used for the purpose of making plausible a statement that we operated the car.

The statement that we operated the car is wholly without foundation. The statement that we were surprised at the performance of the car is, in a sense, true. Our surprise, however, was at the very bad performance of the car, and at the fact that much fuss has been made over so impracticable a device. What we saw was a car equipped with a modern system of electric ignition, though no such system is shown in the patent. Even with such ignition twelve attempts made during a period of two hours resulted in an aggregate operation of about 12 minutes, and over a distance of about 4,000 feet.

To some the performance may have proved practicability, but, in justice to me, kindly publish this letter, so that I may not be accused of being among such number. Between such a car and even a mule—give me the mule. A mule may be slow, and even balky; with him there would be some probability of one's reaching his destination; with a car such as I saw, there would be none.

New York City.

PAUL LACROIX.

### TRADE WARNED OF A SLICK INDIVIDUAL.

Editor THE AUTOMOBILE:

[918.]—We had a call the other day from a very slick individual with a strong English accent, who claimed to be H. G. Graham, son of the president of Argyll Motors, Ltd., Glasgow, Scotland. He claimed to have charge of the Argyll London branch, which is near our London office, seemed to be intimately acquainted with our London representatives, knew to a dollar the amount of goods we had sold in London this year, and knew that we had just received an order for a number of lights for the king's new car, and possessed a lot of other information which would make it seem certain that he was what he represented himself to be.

He stated that he had secured the contract for several thousand lights for the 1908 Argyll cars, and after showing to his own satisfaction that our success abroad was largely due to his unrewarded efforts, remembered that he was short of funds, and tried to secure a loan. Having become suspicious, we turned him over to the police, and found that he had nearly \$1,000 in his pockets. As he had secured nothing from us, we let him go, but now regret this, as he appears to be a professional swindler, and he is such a slick article that we think the trade should be warned.

He speaks very rapidly with a strong English accent, with a great deal of unnecessary profanity; is about 5 feet 5 inches, weighs about 150 pounds, has a smooth face with rather florid complexion, wears glasses, and has very poor teeth, many of them missing, as a result, he explains, of an accident when he was driving the Argyll car in the Isle of Man races last year. When he called on us he wore a blue sack suit and cheap plaid cap from Detroit. He showed a railway ticket on which he had just come from Pittsburg, and claimed to have just placed a \$50,000 contract with the American Vanadium Company, who have just advised us that they never heard of the man.

Plainfield, N. J.

S. W. RUSHMORE.

MODEL 18, 30-HORSEPOWER TOURING CAR, THE LEADER OF THE 1908 PEERLESS LINE.

IT is significant of the more settled conditions of automobile design that structural changes in succeeding models from the leading factories are becoming fewer and fewer. Alterations there always will be as added experience reveals defects and researches make possible further improvements, but radical departures from the models of the preceding year are now a thing of the past. It is a state of affairs which cannot but be eminently satisfactory to every user of an automobile, for it is an assurance that depreciation, once the bugbear of the user, has been reduced to its minimum.

An illustration of this settling tendency is found by a comparison of the Peerless Motor Car Company's models for 1908, details of which have just been made known, and the cars turned out by the Cleveland firm during the current year. To the 30- and 45-horsepower models of last season has been added a six-cylinder car, developing 57-horsepower, according to A. L. A. M. rating. Its cylinder dimensions are 4 7-8 by 5 1-2 inches, the same general motor construction being used here as on the other models. Wheelbase is 133 inches, and a seven-passenger touring body will be fitted. This model, the first of which has been undergoing road tests the greater part of the summer, will be manufactured after January 1. The "fours" for 1908 have already begun to issue from the factory.

The principal changes of next year's models over those of this season are a larger wheelbase, seven-passenger body, radiator directly over front axle, 36-inch wheels, flat springs, and a double ignition system, with magneto as a part of the regular equipment. A review of the features of Model 18, rated as 30-horsepower, will cover all essentials of the two types.

**Motor.**—In general features the construction of the motor is the same as Model 16, of last year. Cylinder bore has been increased to 4 7-8 inches, stroke remaining 5 1-2 inches, as before. The cylinders are cast in pairs, with offset intake and mechanically operated valves on opposite sides. Instead of aluminum, the water-jacket plates are all made in copper. Construction has been slightly

changed in order to insure a more certain removal of core sand. The crankcase is a single aluminum casting, designed for strength and non-leakage of oil, with large hand-hole plates, by means of which easy access can be had to connecting rods and bearings. The crankshaft is a solid drop forging, specially treated, hardened and ground accurately to size. All gears, including half-time, pump and magneto gears, are encased in the forward end of the motor and run in oil, thus minimizing wear and preventing noise. The front bearing is fitted with a stuffing box to prevent leakage of oil. Both intake and exhaust valves, which are mechanically operated, are flat-seated and are made of a special alloy imported valve steel, as used during the past two years. They are adjustable to take up all wear, and to insure silent running after long use.

**Ignition and Carbureter.**—Instead of a magneto being furnished as an extra, it now forms a part of the regular equipment of all Peerless cars. The Eiseman high-tension type is used, and is mounted on a platform on intake side of the motor. In addition, the same coil, commutator and single battery as used in 1907 is again employed, thus giving two independent ignition systems, each with its own set of plugs. The advantage of this double system is that either can be used independently of the other; thus, the commutator, spark coil and battery may be entirely removed from the car, and

there still remains a perfect magneto system; or, on the other hand, the magneto may be taken off, and there is the same well-known battery system employed for several years. All wires are connected with their terminals by a spring attachment, there being no thumb-nuts to release. The magneto can be entirely removed without difficulty in less than five minutes. The commutator is located on the right-hand side of the motor, between the two cylinders, and is brought up level with the top of the cylinders. The carbureter is automatic in its action, providing suitable mixtures for varying motor speeds. The throttle is controlled by

PEERLESS MOTOR, SHOWING METHOD OF WIRING.

PEERLESS DIFFERENTIAL SHOWING WORKING PARTS.

hand lever on steering wheel, by accelerator pedal and by a governor.

**Lubrication.**—Improvements have been made in the oiler so as to cut down the number of oil pipes and connections, and it is now connected with the front and rear compartments of the crankcase, so that by means of a two-way cock the different compartments may be filled direct from the oil tank. Lubrication of the pistons is provided by oil leads from the lubricator to the cylinders, the flow being regulated by means of sight-feeds on the dash. Crankshaft, wristpins, bearings, camshafts, cams and all gears are oiled by splash from the crankcase, which oil is replenished by tubes from the lubricator and regulated by sight feeds on the dash.

**Water Circulation.**—An increase has been made in the size of the radiator over that of last year. By placing it directly over the front axle, instead of slightly forward, the lines of the car have been rendered more graceful. Water circulation is assured by a gear pump. The fan has been materially improved—it is now a single-piece aluminum, and is driven by bevel gears instead of by belt. The construction is particularly robust, extra strength being given to the bracket by bolting it to the forward cylinder.

**Transmission and Drive.**—Connecting the internal expanding clutch with the transmission is a shaft with universal joints at both ends, allowing for easy removal of the clutch without disturbing any other part of the mechanism. Four forward speeds and reverse are provided through sliding gear of the selective type, all controlled by a single lever. Imported ball-bearings of large diameter are used in the gearcase, their lubrication being provided for from outside. The aluminum case has a large-size hand hole on top for inspection of gears. The only change in the propeller-shaft and rear live axle is that all driving parts have been increased in dimensions and are now made from imported silico-manganese steel stock, which experience has shown to be more uniform in quality and much stronger than the alloy steels used on 1907 models. Universal joints on each side

TRANSMISSION, SHOWING THE REVERSE MECHANISM.

of the driving gears and connected with the live-axle take up all strain on the axle and prevent any binding of the gears. These universal joints make possible an arch construction, and also permit dishing the rear wheels two degrees, the same as the front wheels. Imported ball-bearings of extra-large size are used for the road wheels. The axle tubes are of heavy gauge and brazed into the cast-steel differential case, and further strengthened by a webbed collar brazed to the tube and bolted to end of differential casing. The spring saddles are brazed to the axle tube. Distance roads from the frame to rear axle on either side are adjustable by means of a turn-buckle, and a torque rod is used from the differential casing to a spring bracket attached to a cross member of the frame.

**Front Axle and Steering Mechanism.**—The front axle is a solid one-piece drop forging, I-beam design, with spring saddles integral, the center of the axle being the lowest part of the car. Steering knuckles in the axle yokes are fitted with special imported ball-bearings of large size, and with an improved oiling arrangement. The steering gear is of the worm and sector type, the sector and shaft being a one-piece solid drop forging. Instead of being placed before the front axle, the connecting rod between steering knuckles is behind the front axle on the 1908 models.

INTERNAL EXPANDING CLUTCH OF THE 1908 PEERLESS.

**Frame and Springs.**—The cold-rolled steel drop frame, first used on the Peerless Model 15, of 1906, will be continued on all models. The dropping amounts to 2 1-2 inches just in front of the rear axle, and carries the center of gravity of the car nearer the ground without interfering with the road clearance. French Lemoine springs of special silico-manganese steel are used for the semi-elliptics in front and the platform suspension in the rear, and are longer and flatter than those of 1907.

**Wheels.**—Thirty-six-inch artillery wheels, with dished spokes, are used both front and rear. Four-inch clincher tires are mounted on the front wheels, and 4 1-2-inch on rear.

**Model 15.**—The 45-horsepower car is similar to the one described, with the exception of cylinder dimensions, being 5 1-4 by 5 3-4 inches and wheelbase 119 inches. It is furnished with limousine body, interchangeable with the standard touring body, or with roadster body, which is not interchangeable.

**Body and Color.**—The body is of Peerless type, king of Belgium lines, the rear seat being wider and the tonneau longer and more spacious, and built to carry seven people comfortably. Small seats of folding type are used, which are practical and comfortable, and which may be folded against the side when not required for use. They are also removable. The standard color will be maroon with coach painter's light red running gear. Other color combinations will be furnished only when ordered special.

TYPE XIV AUTOCAR TOURING CAR FOR 1908, WHICH HEADS THE AUTOCAR LINE FOR THE COMING SEASON.

TO meet the demand for a high-powered runabout that has become so prevalent, the Autocar Company, Ardmore, Pa., builders of the cars of the same name, have developed a special type which has been given the title of the Autocar "mile-a-minute" roadster, the attractive appearance of which is apparent from the illustration. The standard Type XIV Autocar chassis forms the foundation of the car, but numerous modifications have been made to make the complete car conform more closely to the special use to which it is to be put. The drive is geared higher than on the touring car for obvious reasons, while the control levers have been shortened and moved back, an 18-inch steering wheel being fitted. The bonnet is 4 inches longer, and the mechanical oiler has been placed forward of the dash under the hood instead of being mounted on the former. In other respects the standard features of construction long identified with Autocar practice have been retained. The most prominent of these are the independently cast cylinders, and the three-point suspension of the unit power plant, the motor, change-speed gear and clutch all being contained in a special sectional case of material of high tensile strength, the different parts of which are firmly bolted together and the whole supported as a unit at three points. Two of these are bolted directly to the frame forward, making a rigid joint, while the third, situated under the center of the gearcase, is seated on a stiff spring attached to a cross member of the frame. This arrangement eliminates the usual subframe con-

struction and also insures constant alignment of the essentials of the power plant and drive. Both the motor and the transmission are protected from below by means of a metal shield. The regulation equipment has also been extended to include a gas-tank, speedometer and tire holders.

The other members of the Autocar family for 1908 consist of the standard touring car and the two-cylinder runabout, known respectively during the past year as Types XIV and XV. Long experience in the building of these cars has demonstrated the value of the features of construction which they embody, so that there will be practically no radical change in their design for the coming season. Their builders are one of the oldest manufacturers of automobiles in this country, and, moreover, a firm that has consistently adhered to the distinctive design that it has evolved in the course of a number of years of building cars. Minor improvements and detailed additions here and there will be made—in fact, are always being planned in the draughting rooms of every up-to-date automobile plant—and the Autocar will be no exception in this respect, but designs have approached to a standard so closely within the past few years that familiarity with what has preceded is essential to distinguish the changes in new models. The line will also naturally include standard types of covered cars such as a limousine, mounted on the standard Autocar chassis, of which the makers are planning to turn out a larger number than ever during the season of 1908.

THE POPULAR TWO-CYLINDER AUTOCAR TYPE XV.

AUTOCAR "MILE-A-MINUTE ROADSTER"—THE NEWCOMER.

## MILAN'S AUTO FIRE ENGINE TESTS.

Vice-Consul Ernest Santi, of Milan, reports as follows on the mechanical progress of that Italian city in fighting fires:

The first automobile fire engine tried in Milan in the year 1901 was a benzine car, 10 horsepower, and was fitted with first-aid material and with places for four firemen. The second trial was made with an American car (the Oldsmobile) of 7 horsepower, for the use of the chief officers, and with a Panhard car for four firemen, which was at first used as a first-aid car, but was then rebuilt into an engine by using the motor of the car when not running for pumping purposes.

In 1905 the fire brigade bought an Orion car of Italian make and fitted it with a piston pump with a delivery of 790 quarts of water, and driven by the motor of the car when not running. These first trials were satisfactory, but their continuance showed that some most important changes would have to be made so as to get a perfect working of the engine.

In 1906 the Milan department bought two large automobiles, Bianchi cars, made in Milan. These two 18 and 24 horsepower cars were intended for carrying the men to fires, but the system was of little value, as the crews arrived so far ahead of the horse engines that they had to remain idle for some time until the slower apparatus arrived. For this reason on one of the cars a small pump was fixed, worked by the motor when the car was not running. An Italian-made pump was built especially for this service so as to fill the smallest possible space, while, being a piston pump, it delivered the water as high as an ordinary fire engine. The pump is 2 feet long, 1 1-5 feet wide, and 1 3-10 feet high, everything included. It has two cylinders coupled together with two connected pistons. The pump weighs 275 1-2 pounds. Starting is effected by the same lever by which the motor is worked. The interlocking mechanism of the wheels during the working of the pump is closed in an aluminum box, with an oil bath, and supported by spherical bearings. The disposition of the pump is such that the car itself did not have to be modified in any way. The handle for the aspirator is on the posterior side, next to the benzine tank, and the handle for the pressure tube is under the right forward seat. The air tube for the pressure mechanism is fixed to a corner of the car.

The maximum velocity of this car on a plain is 44 miles per hour, although as a rule it runs generally at 37 miles, with a cargo of four men, one officer and chauffeur, together with hose and first-aid material. Experiments have shown that the maximum delivery of the pump is about 500 quarts per minute, and the mean delivery 450 quarts.

The Milan fire brigade has also experimented recently with a steam automobile pumping engine bought recently from a firm in Saxony. The chassis, a U-shaped frame, resting on springs attached to the axles, carries the boiler, the motor, and the mechanisms for the propulsion of the car, and for the pump. The rear wheels have a diameter of 3 feet. The front wheels have solid india-rubber tires, while the large wheels have double solid tires. A special friction differential apparatus allows one wheel to go forward and the other to work backwards, to be guided in places where the streets have sharp curves. The motor propulsion of both the pump and the car has two cylinders, with the so-called Stephenson disposition. The pump is a two-cylinder machine. The fuel can be either coal or petroleum, but petroleum is found much more convenient, as the stoker only turns the tap on and the flame is immediately working. The feeding of the boiler can be effected in three ways—by the injector, by a hand pump, and by a special steam pump. There are two water tanks, a small one on the rear of the engine next to the boiler and a larger one under the seat of the chauffeur.

Five firemen and a stoker can be accommodated on the car, which, so laden, can run at a mean speed of 15 1-2 miles per hour, although on a smooth road and with no obstacles in the way of other traffic it has run easily at the rate of 22 miles. Experiments have shown that the car can deliver 950 quarts of water

per minute at a sufficient height. The machine when running requires 30 horsepower and the pump 25 horsepower.

The remarkably small brigade, as well as the low fire loss, in Milan, the population of which is nearly 600,000, is explained wholly by the strict inspection laws and by the stone and cement construction required by the laws.

## THE AUTOMOBILE CALENDAR.

### AMERICAN.

#### Shows and Meetings.

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.
- Oct. 26.....—New Haven, Conn., Second Regiment Armory, Third Annual Automobile Show, New Haven Business Men's Association.
- Nov. 2-9.....—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.
- Nov. 29-Dec. 6.—Chicago, Casino Garden, Second Annual Auto Parts Show. A. M. Andrews, secretary, 184 La Salle street.
- Nov. 30-Dec. 7.—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 14-21.....—St. Louis, Mo., New Coliseum, Second Annual Auto Show, St. Louis Automobile Manufacturers' and Dealers' Association.
- Dec. 28-Jan. 4.—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.
- Feb. 3-8.....—Buffalo, Convention Hall, First Annual Power Boat and Sportsmen's Show, auspices of Buffalo Launch Club. Dal H. Lewis, manager, 760 Main street, Buffalo, N. Y.
- Feb. 20-Mar. 7.—New York City, Madison Square Garden, Fourteenth Annual Motor Boat and Sportsmen's Show.
- Mar. 9-14.....—Buffalo, Convention Hall, Sixth Annual Automobile Show, Automobile Club of Buffalo. Dal H. Lewis, manager.

#### Races, Hill-Climbs, Etc.

- Sept. 28.....—Chicago, Harlem Track, Race Meet, Chicago Automobile Club.
- Sept. 27-28.....—New York City, Morris Park Motordrome, 24-hour Race, Morris Park Motordrome Club.
- Oct. 4-5.....—Trenton, N. J., Inter-State Fair Automobile Races, Includes 24-hour Event.
- Oct. 19.....—Kansas City, Mo., Kansas City Jockey Club Track, Race Meet, Automobile Club of Kansas City.
- Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

### FOREIGN.

#### Shows.

- Aug. 1-Sept. 30.—Holland, Amsterdam, International Exhibition of Motors and Machines, Palace of Industry.
- Sept. 28-Oct. 7.—Denmark, Copenhagen International Auto Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1.—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.
- Dec. 5-22.....—Berlin, Germany, Automobile Show.
- Jan. 18-Feb. 2.—Turin, Italy, Fifth International Automobile Exhibition, Palace of Fine Arts, Valentino Park, Automobile Club of Turin.

#### Races, Hill-Climbs, Etc.

- Oct. 1-15.....—Paris, Electric Vehicle Competition, Automobile Club of France.
- Oct. 20.....—France, Gallion Hill Climb.
- Nov. 1-15.....—France, Voiturette Contest near Paris.
- May 16, 1908....—Sicily, Targa Florio, Automobile Club of Italy.
- June 20-July 5, 1908.—Grand Prix, Dieppe Circuit, Automobile Club of France. (Exact date to be announced.)
- July 14, 1908....—Paris to London, Aerial Race.
- August, 1908....—France, Coupe de la Presse, Automobile Club of France. (Exact date to be announced.)

**A**FTER a long period of testing under severe conditions, the Logan Construction Company, of Chillicothe, O., completed, about two months ago, a new three-ton truck officially known as Model S. Results were so satisfactory under the trying-out process that the company decided to build another and smaller model, with a load capacity of one ton, to be known as Model T. The two 1908 commercial vehicles being built on similar lines, the smaller truck an exact duplicate in miniature of the larger model, a description of Model S will suffice for both.

Mounted forward on a subframe attached to the 5-inch channel-section pressed steel frame is a 40-horsepower water-cooled vertical four-cylinder motor, with its 4 3-4 by 5-inch cylinders cast in pairs. Valves are all mechanically operated, ignition is by jump spark, and the carbureter is of the float feed type. Seeking to combine extreme simplicity with efficiency, close attention has been paid to cooling and lubrication. The former is provided for by a large size radiator, gear driven pump and fan. The oiler has been cast with the engine crankcase, circulation being assured by a gear pump. Tests have shown a high efficiency combined with great economy in the matter of lubrication of these trucks.

Transmission, an important factor in any mechanically operated vehicle, is of vital importance in the life of a heavy load carrying truck and has rightly been given the attention it needs by the Logan Construction Company. First in the line is a multiple disc clutch, the casing of which is cast integral with the flywheel, and is absolutely oil-tight. A propeller shaft with two universal joints transmits the power to the gear set by which three forward speeds and reverse are obtained on the selective principle. From the countershaft to the rear wheels the drive is taken by side chains of 1 1-2-inch pitch and 3-4-inch width. Krupp chrome nickel steel is employed throughout for the gears, which are of 6-inch pitch and 1 1-4-inch face. Timken and Hess-Bright bearings with ample adjustments on each part play an important part in the efficiency of the transmission. The heavy side chains are guaranteed to stand a strain of 60,000 pounds each, and the makers claim that one set will give good service for at least two years.

Engine control is by spark and throttle levers mounted on the steering column. All gear

changes are obtained by a single lever at the right of driver's seat, the emergency brake lever is equally accessible, and clutch and running brakes are operated by foot pedals. To simplify gear changes the clutch and propeller shaft are automatically braked on the operation of the foot clutch or the emergency lever. The capacity of the gasoline tank is fifteen gallons. Security is assured by five brakes, one set on the rear hubs, one set on the jack shaft and one brake on the clutch. Steering is of the worm and nut type.

Front and rear axles have been designed with an ample margin of strength above the heaviest load capacity of the vehicle. The rear axle is of solid steel, 2 1-2 inches square, with integral spring seats. Large Timken roller bearings are used for the road wheels and for the steering knuckles. The long I-section radius or reach roads, plainly shown in illustration, are a feature which will be appreciated.

Suspension is such a vital factor in the life of both machinery and tires that no conscientious builder can afford to neglect it. The Logan Construction Company has adopted full elliptic springs forward and platform type of suspension in the rear. With eleven leaves 5-16 inches by 2 1-2 and 38 inches long for the front set and twelve leaves 5-16 inches by 3 inches in the rear, the life of tires and engine should be prolonged to the maximum.

Tire dimensions are 36 inches by 5 inches in front and 3 1-2-inch twins in the rear. Wheelbase is 108 and tread 60 inches.

#### An Addition to Logan Runabout Family.

In the touring car branch of their business the Logan Construction Company has made an interesting addition in the shape of a special semi-racer runabout. This vehicle, which will supplement the regular runabout designed for the use of professional men, physicians, etc., is equipped with a 20-24-horsepower air-cooled motor. It is constructed along the same lines as the regular Blue Streak runabout which has made such a good record for itself, and, as will be seen from illustration, is of a pleasing, racy appearance. Features of the regular Blue Streak, which will be continued, are four-cylinder, air-cooled motor, sliding gear transmission, shaft drive, and jump spark by storage battery. Total weight is 1,587 pounds.

THE NEW LOGAN AIR-COOLED SEMI-RACER ROADSTER.

# A CRITICISM OF STEERING GEARS IN GENERAL USE\*

BY LOUIS T. WEISS, CHAIRMAN TECHNICAL COMMITTEE L. I. AUTOMOBILE CLUB.

**A**N unusual number of automobile accidents have occurred recently, and in most cases we read that the steering gear broke, or that the car, when going at high speed, became unmanageable, or the driver lost all control of his car, or the car first headed for one side of the road and then for the other, finally landing upside down in a ditch, or succeeded in smashing itself to pieces on a stone wall, tree, telegraph or other pole. In most of these cases one or more lives were lost. There can exist but little doubt that the statement, "that the car became unmanageable," is correct in many of the sad occurrences.

Your committee has had no opportunity to examine any cars after accidents had taken place, and if such opportunity had presented itself, we would have proved of little value since the cars are mostly a general wreck. The survivors, if any, will surely not care to rehearse all the details if they knew them, of such a calamity where perhaps their dearest ones were crushed to pulp, or torn to pieces.

We have examined and considered the steering gear now in general use, and believe that it is certainly deplorably faulty. It is surprising that the manufacturers furnish such a mechanism

The mechanism proper, such as the worm and gear, or the nut and thread, as well as the steering knuckles, are generally very well proportioned and well made. With the reach rod, which is just as important as the rest, it is different. When assembling, the ball F is entered through opening X, and surely can come out the same way if the sockets CC open. Then the rod B will fall to the ground, and all connections between the hand wheel and the front wheels of the car are broken. You are absolutely at the mercy of fate. Your car runs wild. The sockets CC will open when either of the springs break, and break they will, as the writer has personally removed one spring in three parts.

It is true that some makers of cars make the opening buttonhole shape, and others slit it all the way out to the end, so that the ball can only be entered from the end, or through the large part of the buttonhole opening, and, when in place, these are covered or closed by a nut or cap, which at the same time answers the purpose of compressing the springs, as does E in the sketch. We have then an opening through which the ball cannot pass and the rod cannot drop off. We have examined such connections and found some where the thin wall of the tubing had been worn so large that the ball passed through easily. Others were so that the blow of a fist forced the rod off.

In the sketch we show a primitive, but quite an effective way to prevent the dropping of the rod if the springs should break so that your car will not run wild. The writer has taken such precaution ever since he has run cars, and has, as before stated, removed one spring in three pieces. After the break the wheels wobbled quite some, but the car could still be steered.

We do not recommend this particular method of drilling a hole and drawing a wire through it and around the tube B in all cases, since some steering cranks and knuckles would be weakened too much by the hole. But we do believe it to be a very wise precaution to fasten the parts either by wire or other means, so as to prevent the reach rod from falling, jumping or being jerked out of connection if the sockets CC should separate.

Some, and perhaps many, will say, "I have driven my car for two or three seasons, at high speeds, too, and I have never had any such trouble," but we should remember that one experience will be just once too often, and it is likely that we will not live to tell the tale.

DETAILS OF COMMONLY USED TYPE OF CONNECTION.

when they well know what must result on its breaking down while in use. The kind of steering gear which we speak of consists of the hand wheel, worm gear or nut movements, which causes the steering crank to swing in a vertical plane. This crank is connected to the steering knuckle by means of a reach or connecting rod swinging in a horizontal plane. To this rod, of which we show the principle by sketch herewith (sketch shows one connection only, the other is similar) we wish to draw your serious attention.

Since the steering crank A moves in an arc of a vertical plane, and the steering knuckle (not shown) in an arc of a horizontal plane, it is necessary that the connecting rod B be so made as to allow for up and down, and at the same time sidewise or lateral, motions at each end. A convenient and nice way to accomplish this is to have the ends of both cranks ballshape, shown at FF in sketch. The sockets CC partly encircle the ball end F of crank A. The springs DD exert a pressure tending at all times to keep the sockets CC in close contact with ball F. The nut E in some cases enters the tube B as shown, and in others, screws around the outside of that tube. In nearly all cases the tube is of about one-third the thickness shown on the sketch.

This tube generally has an oblong hole cut into its side large enough to allow the ball end, together with the two sockets, to move freely and longitudinally in the tube B, thus forming a yielding and playless connection between the crank A and the steering knuckle. A yielding connection is very desirable, since it prevents snapping off of the steering knuckle, as well as lengthens the life of the irreversible steering mechanism proper.

Now let us see where we can justly criticize it.

## THOUSANDS OF AMERICAN AUTO PARTIES ABROAD

Consul R. E. Mansfield, writing from Lucerne, Switzerland, says that it is estimated that there are now in Europe 8,000 American touring parties in automobiles. He adds:

Each car carries on an average five persons, making a total of 40,000 Americans autoing on the Continent. The expense will average \$10 per day for each person, making a daily expenditure by this class of American travelers in Europe of \$400,000. The American motorist usually spends two months on the Continent, which brings the aggregate expenditure up to \$24,000,000 for the season. So great is the number of American automobiles on the Continent that the transport of motors across the Atlantic has become a regular and specialized business. A properly equipped touring car is a private train and yacht combined. The traveler can go north, south, east, or west, when he wishes, stop as many days as he wishes at one point, and has no need to worry about tickets or luggage. Motor tourists on the Continent are brought much more into touch with national life than the railway traveler, who, passing through Europe on a train de luxe, from one hotel de luxe to another, finds all Europe alike, sees nothing of national costume or habit, and hears little except his own language.

The great interest in motoring in all parts of the world, and especially in using automobiles as a means of travel as well as pleasure by Americans in Europe, will furnish additional stimulus to the trade and an incentive to American manufacturers to meet the demand for and compete with the continental manufacturers in the world's markets for high-grade touring cars.

# WHAT THE AUTO CLUBS ARE DOING JUST NOW

## THE NEWS FROM WORCESTER, MASS.

WORCESTER, MASS., Sept. 23.—September 25 is old home day at Bellingham, Mass. This is a little town on one of the routes between Providence and Worcester, and its officials have succeeded in getting a State highway right through it. There is now but one section of this route where there is no State highway. That is between Worcester and Grafton, and members of Worcester club and others in Milford, Hopedale, and the vicinity towns, headed by William H. Baker, of Milford, want a gathering of motorists at Bellingham to show the appreciation of the good roads there and to stir up a sentiment for the completion of the route with the State highway.

September 27 the contests and tours committee of the club has called an informal run to Barre. It is the last day of the annual fair of the Worcester County West Agricultural Society, and a good show and a good time are promised by the management of the fair for the members of the club. A delegation of Worcester motorists will attend the Valley fair, at Brattleboro, Vt., September 25. There will be Worcester competitors in the automobile parade there.

Plans are being talked up between the Worcester Automobile Club and Rhode Island Automobile Club, of Providence, for a joint gymkhana. At present the prospects are good for a gymkhana and other stunts at Providence this fall with teams from both clubs participating, and a return event under similar conditions at Worcester next season. President John P. Coughlin, of the Worcester Automobile Club, is taking a two weeks' vacation in Nova Scotia and New Brunswick.

## L. E. MYERS NOW PRESIDENT ILLINOIS STATE A. A.

CHICAGO, Sept. 23.—L. E. Myers, delegate from the Chicago Automobile Club to the annual meeting of the Illinois State Automobile Association, has been elected president of that body, succeeding Sidney S. Gorham, the retiring chief executive, Samuel P. Irwin, of Bloomington, George W. Ehrhart, of Decatur, and R. M. Baker, of Springfield, were elected, as vice-presidents. John Farson, treasurer, and W. H. B. Weston, secretary.

The new directorate consists of Ira M. Cobe, John Farson, L. E. Myers and Sidney S. Gorham, Chicago Automobile Club; R. M. Baker, Springfield; G. W. Ehrhart, Decatur; S. P. Irwin, Bloomington; H. A. Olson, Woodstock; J. H. Francis, Austin; R. A. Whitney and B. C. Hamilton, Chicago Motor Club.

## PORTLAND TO BAR YOUTHFUL DRIVERS.

PORTLAND, ORE., Sept. 19.—That no person under the age of eighteen years shall be permitted to drive an automobile on the streets of Portland is one of the provisions of a new ordinance adopted by the special committee of the Common Council for favorable report to that body, after consultation with representatives of the Portland Automobile Club, which is a unit in endorsing the new regulation. Boys and girls driving machines have been a common sight here, but after the ordinance is passed they will have to be accompanied by their elders. Another regulation adopted with a view of minimizing chances of accident is that automobiles must not pass between the curb and a street car that has stopped to take on or discharge passengers.

## GENEVANS TO INCREASE ROAD-SIGN FUND.

GENEVA, N. Y., Sept. 23.—At the last meeting of the Geneva Automobile Club it was voted to increase membership dues to \$4 per year, with the view of increasing the funds for placing additional road signs in the vicinity. A danger sign has been placed at Bean's hill, which is a bad spot for automobilists unacquainted with the territory.

## A. C. A. INSIGNIA FOR MEMBERS' CARS.

NEW YORK, Sept. 24.—A committee of the Automobile Club of America, consisting of Melville D. Chapman and Dr. Schuyler Skaats Wheeler, has brought out a club plate that can be attached either to the dash or radiator of members' cars. These plates, which are about three inches square, are made of brass, with the words "The Automobile Club of America" at the top of the plate. In the center is the club flag enamelled in colors on a black background, while at the bottom is a serial number. In a circular letter to members the committee, in advocating the use of the new device, says:

The plates will be useful in several ways. They serve as a means of identification and as proof of membership in the club. They may be useful in dealing with supply houses on the road, and also possibly as a means of identification in case of trouble. It is, therefore, obviously necessary that members should agree to be responsible for the custody of the plates, and to remove them from their cars if they allow the cars to leave their possession and ownership, and return them to the club in case they cease to be members of the club, or upon demand, and in accepting the plates members will do so subject to the right of the club to retake its property wherever found, in the event that it is not returned as agreed.

## SANTA BARBARANS TOIL TO IMPROVE THE ROADS.

SANTA BARBARA, CAL., Sept. 18.—Impatient at the tardiness of the County Supervisors in making passable the roads leading out of the city, a dozen members of the Santa Barbara Automobile Club, armed with picks and shovels, and conveyed in three autos, sallied forth last week and did yeoman service in improving the Gaviota road. Some weeks ago volunteers from the club did the trick for the El Capitan road, going over twenty-five miles of rock and chuck holes and making a fairly decent road-bed. Despite the hot sun the learned professions vied with each other in the application of muscle, led by Clio Lloyd, candidate for Mayor of Santa Barbara, who swung his pick with great dexterity and effect. After the road had been voted to be in excellent repair, the "laborers," with their wives and friends, enjoyed a picnic beneath the spreading oaks in the Rincon Canyon.

## FIRST RACE MEET IN THE OHIO VALLEY.

WHEELING, W. VA., Sept. 23.—Plans are maturing for a mammoth race meet to be given on the State Fair Grounds, near Wheeling, by the Ohio Valley Automobile Club. Arrangements are being perfected under the direction of Secretary T. A. Westmyer, although auto owners all along the Ohio Valley are becoming interested.

Auto owners from down the Ohio river as far as Marietta and Parkersburg, W. Va., will take part in this event. This will be the first event of the kind to be held in the Ohio Valley, and because of this great interest is being shown. Committees will be selected within a fortnight, after which dates for the race meeting will be decided upon.

## RECENT AUTO CLUB ELECTIONS.

SAN ANTONIO, TEX.—H. E. Ogg has been elected president of the San Antonio Automobile Club to succeed Henry Crawford, who recently died. The club is making active preparations for a number of long runs throughout the State during the winter, which is the finest season of the year for autoing here.

LINCOLN, ILL.—At the annual meeting of the Lincoln Automobile Association held last week the board of directors was enlarged from three to six members. The membership of the board for the ensuing year is L. W. Walker, E. L. Edwards, C. L. Hyde, B. F. Coffman, K. L. Hyde and G. F. Phillippe.

**Whence the Lack of Interest in Commercial Vehicles?** From an economic point of view there is nothing about the automobile industry in this country as a whole that strikes the observer so forcibly as the almost total lack of general interest in the gasoline-driven commercial vehicle. Comment on the subject is opportune at a time when extensive and widely advertised competitions are being held in both England and France. There has been an event of this nature held here, which need not be characterized, and another abortive attempt to second it which came to worse than nothing, as it placed the commercial vehicle further behind, at least where New York City is concerned, than if the matter had been allowed to sleep in peace, as it has done since. That there is a vast field for the commercial vehicle goes without saying, but even granting its great superiority over present methods, the fact must be recognized that the prospective users of such vehicles are in the same position as the steam railroads where electric traction is concerned. They have on hand many thousand dollars' worth of costly equipment which cannot be scrapped simply because there is something better. The value of the horses and wagons operated by express companies, for instance, would reach a tremendous figure and the same thing is true of other large users.

Progress must necessarily be slow, but something could certainly be done to hasten the advent of the commercial vehicle, at

least at a slightly faster rate than has characterized its advance up to the present. There are a great many vehicles in daily use and a great many more being built, but the trouble is so little is heard of them and they are so few compared to the vast bulk of other traffic that very little is seen of them. Publicity is what the commercial vehicle needs more than anything else, but unfortunately it is overlooked and little or nothing heard of it in the din and clamor with which the pleasure vehicle is constantly surrounded. The market for the two is not as widely separated as might appear at first sight, for it is frequently the business man's experience with his car that leads him to investigate the possibilities of automobile delivery and heavy haulage. It would do a great deal of good, not alone to a special class of makers, but to the industry as a whole, to give the commercial vehicle side a little more attention.

**A Weak Point in Most of the Repair Shops.**

Why, when a repair man takes an automobile for a complete overhauling, does he so frequently neglect to tune it up to its highest degree of efficiency? The question has been forced upon us by a number of cases in which a car, after coming out of the hands of the repairer, was in an apparently worse condition than when it entered his establishment. We are not here referring to the automobile butcher, whose attentions cannot be otherwise than injurious to any piece of mechanism, but to first-class firms with experience, an efficient staff, and such modern machinery as to inspire confidence. At the commencement of the touring season the owner ships his car to such an establishment, giving instructions for a complete overhaul of engine and transmission. Too frequently he is disappointed and disgusted on the first run to find the engine pulling badly, not because of any material defects, but owing to lack of attention to such minor matters as ignition and carburetion. The trouble lies in the fact that the work has been done by a shop mechanic with little experience on the road. Running an engine light in the repair shop is not sufficient to guarantee it being in condition to operate satisfactorily on the highway. Fear of accidents and the lack of suitable roads in the neighborhood may be primarily responsible for the substitution of a shop tuning up for a thorough road test. In any case it is dissatisfying to the owner and injurious to the reputation of the repair man that a machine fresh from an overhauling should need to have the carbureter cleaned out, throttle adjusted, commutator attended to and sundry bolts screwed up. Twenty miles on the road, with a skilled tester at the wheel, would have caused all such defects to be brought to light and remedied.

**New York: The World's New Center of Automobiling.**

Wandering around upper Broadway, Fifth avenue, and other portions of New York where automobiles most congregate, the man who has the time for such diletantism cannot but be struck by the fact that the metropolis of the United States is becoming more and more the rendezvous of all types and nationalities of horseless vehicles. Registration tags at the rear of the ubiquitous machines tell an interesting story to those who care to read them. During the past few weeks might have been noticed, in addition to the familiar official registration numbers of New York and New Jersey, tags from every State in the Union which has thought fit to busy itself with registration. Foreigners, too, had their peep in with cars carrying the E, G, and I, of Paris, and the LC, of London. The British Automobile Association's road badge occupied the position on one visitor's car which some Broadway habitués prefer to give to a more homely mascot. The thought suggests itself: Will the tag habit, from which the handbag traveler has always suffered, make itself felt among automobiles and worry the bicycle policeman as the railroad porter is now worried? A chair in the Champs-Elysees, Paris, used to be declared to be the best spot in the world to witness a meeting of automobiles from all parts of the globe. The vantage point seems to be moving a few thousand miles westward.

## FIRST GOOD ROADS AND GOOD LAWS CONVENTION

SPRINGFIELD, MASS., Sept. 24.—A pronounced success and the forerunner of others that will follow and assume even greater national proportions was the good roads and legislative convention of the Automobile Club of Springfield, held all day in Cooley's Hotel, and concluding in the evening with an enthusiastic banquet. So well did the brilliant idea find accord that the A. A. A. national officers present conferred with the local officials and these resolutions resulted from the morning session, which was devoted to good roads:

Resolved, that the subject of the best material for surfacing roads be referred to the Good Roads Board of the American Automobile Association, with the request to investigate and report at the next convention.

Resolved, further, that the American Automobile Association be requested, either as an association or through one of its clubs, to call a convention on Good Roads and Legislation in the summer or fall of 1908.

Stanford L. Haynes.  
William H. Hotchkiss.

Lewis R. Speare.  
Robert P. Hooper.

Dr. A. S. Cushman.

The actual results of the convention as a whole, so far as any definite action was concerned, found nearly complete expression in the foregoing set of resolutions, and those discussed later in the day, but not reproduced here for lack of space; both were adopted by the convention unanimously. The first were approved following the discussion of the morning, which was restricted to the subject of "Good Roads," and the second set after the afternoon session, when the question of "Automobile Legislation" was the theme. Following the spirit of the first resolutions, which provided for a similar convention next year, it was practically agreed that the next convention, which will be called in the fall of 1908, will be held in Buffalo.

### Results of the Morning Session.

The morning session was opened by Mayor William E. Sanderson, of Springfield, and the delegates were further welcomed by H. H. Bowman, president of the Board of Trade. W. L. Dickinson, vice-president of the New York and Chicago State Roads Association, was the first speaker, and he discussed the value of trunk systems of roads between States and their value to the consumer and the farmer.

William E. McClintock, of Massachusetts, asserted positively that the automobiles have been and are working damage on the State highways incommensurate with their number, as compared with other sorts of vehicles, and defended the method adopted this year by the Massachusetts Legislature at the recommendation of the State Highway Commission, of a re-registration of the automobiles and the application of the proceeds from the fees to improvements in the State's highways.

Dr. Cushman made his main plea for good roads on the ground that they bring about an esthetic development in the people who use them. He explained the value of the department which he represented to farmers with limited means who want to know how to make their money count for the most, and to whom the bureau is able to give just the information desired.

Commissioner Edwards, of Rhode Island, suggested a treatment for the roads which he declared possessed everything desired for the new road, but which apparently was too costly for the average State. The treatment consisted of a new surface of several inches depth of stone and tar, with an exterior coating of tar and then the surface layer, also permeated with the tar.

Mr. Hooper, as a member of the national association, took exception to the statements of the Highway Commissioners and declared that it was yet to be proven to his satisfaction that the automobile injured the roads more than the ordinary vehicle. He believed the solution to the problem lay, however, in a co-operation on the part of the autoist and the roadmaker.

Judge W. H. Hotchkiss, president of the American Automobile Association, delivered an address that was concise and convincing, making an evident impression on his hearers. After discussing the manner in which the rights of the autoist under the State law may be affected by the police power in the placing of fair restrictions on automobilists, he continued in part:

"It is an old saying that the legislator has his ear close to the ground, and at present there is not the slightest doubt that our legislators are inclined to be responsive to waves of prejudice. This condition is a menace to the rights of the automobilist as a citizen. We are going to stop the tax on automobile traffic as it is enforced in certain localities, and we are going to do it by Federal legislation. There are prejudices prevailing against the automobilist, and they are due somewhat to the envy of those who haven't, for those who have. At any rate, the sane use of the roads by the automobilist is the only way to conquer those prejudices. Racing on circular tracks, the dangers attendant thereon and the sensational reports that the resulting accidents give rise to in the newspapers, serve to stimulate prejudice. During my administration as head of the American Automobile Association, I intend to do away with racing on the highway without the taking of proper precautions. Not 2 per cent. of the owners of automobiles drive other than sanely, but when it comes to the foreign chauffeurs which you have in New York City, I don't believe that there is 2 per cent. of that class that do drive sanely. There is at present a chaos of motor laws in the several States, and we need Federal law to make legislation uniform. Automobile travel from one State to another is commerce, and as such should have Federal supervision. The national association has prepared a bill providing for national registration, which it will push before the next session of Congress, and another calling for uniform speed laws and penalties."

### Done at the Afternoon Session.

James H. McDonald, of Connecticut, declared himself in favor of the registration system of raising money for State roads and declared that the matter had been put up to the Connecticut autoists and that they had fully agreed with the Highway Commission that it was just and efficient.

William P. Hayes gave an exhaustive account of the Massachusetts automobile legislation, and Congressman Gillet, in a discussion of national legislation, asserted that in his belief Federal laws governing automobiles were not likely to prosper when pushed by automobile clubs owing to prevailing prejudices.

Following the afternoon session, at the suggestion of W. Clive Crosby, delegate from the New Jersey Automobile and Motor Club, a second committee was appointed to endorse the views of the convention as expressed in the discussion of the afternoon, which were confined more to the legal aspects of the automobile problem. The committee consisted of Judge Hotchkiss, Dr. Cushman, Robt. P. Hooper, William E. McClintock, chairman of the Massachusetts Highway Commission, and Arthur E. Corbin of the local club, and the set of resolutions were submitted to the committee and endorsed by a standing vote of the convention at the banquet last night.

### Over Two Hundred Present at Banquet.

More than 200 covers were laid at the banquet held in the evening at Cooley's Hotel, and the function proved as notable as the business session of the day. Colonel C. L. Young, chairman of the banquet committee, facetiously introduced the Hon. Charles W. Bosworth as toastmaster of the occasion. The speakers included Dr. V. J. Irwin, president of the Automobile Club of Springfield; Congressman F. H. Gillett, of Springfield; Colonel A. P. Langtry, editor of the *Springfield Union*; Dr. Harvey Martin; L. R. Speare, first vice-president of the A. A. A.; Judge W. S. Kellogg, of Westfield; A. G. Batchelder, editor of *THE AUTOMOBILE*; Frank B. Hall, Worcester Automobile Club; E. H. Lathrop, of Springfield, and Robert P. Hooper, chairman of the A. A. A. Good Roads Board, who introduced a resolution of thanks on behalf of the visitors for the numerous courtesies extended during the entire course of the convention.

### SIX-CYLINDERS AT THE GARDEN SHOW.

Predictions of the coming of the six-cylinder in 1908 will begin to materialize in tangible form at the coming Garden show of the Association of Licensed Automobile Manufacturers, to be held from November 2 to 9, as it is now known that no less than eleven cars of this type will be staged. They will range in horsepower from 42 to 70, and as they will all be rated under the new A. L. A. M. formula there will be some odd figures, such as 48, 46.6, 43, 45, 51 and the like, the cylinder bores ranging from 4 1-8 to 5 inches. The minimum price is \$3,500 and the maximum \$6,500, the former being represented by the familiar Stevens-Duryea "Little Six" of 35 horsepower, officially known as Model U, and the latter by the 60-horsepower Pierce-Arrow. Between these two extremes there is the Franklin 42-horsepower, air-cooled, six-cylinder car, the only one of its type in the show, listing at \$4,000; the 48-horsepower, six-cylinder Oldsmobile, listing at \$4,200; the Winton "Six-Teen-Six," recently described in *THE AUTOMOBILE*, and listing at \$4,500, and the two Pierce-Arrow "sixes" of 43 and 60 horsepower, respectively, and listing at \$5,500 and \$6,500. No less than six of this new multi-cylindered type are listed at \$6,000. These are the 45-horsepower Apperson, the 70-horsepower Stearns, the 51-horsepower Lozier, the 60-horsepower Thomas, the 50-horsepower Stevens-Duryea, and the Peerless. All of them will be made in both runabout and touring car types and there will be a sprinkling of both at the show, so that the six-cylinder will doubtless come into its own with a great flourish.

### QUAKER CITY ANNOUNCES ITS SHOW DATES.

PHILADELPHIA, Sept. 23.—The local Automobile Trade Association got busy last week and took the first step toward holding the annual show by selecting a date. After much discussion it was decided to open the show on Saturday, November 9, and continue it till the following Saturday. Following immediately upon the New York shows, and previous to that at Chicago, the association managers believe that they will secure a large number of exhibits from the Gotham exhibition. No decision was made as to where the show is to be held, the dearth of big buildings in the heart of the city, as usual, necessitating the crowding of the show into some one of the utterly inadequate armories.

President W. F. Smith on Saturday announced the following show committee: George H. Smith, manager of the local White Company branch; Edward Leeds, of Titman, Leeds & Co., Studebaker and Matheson agents; E. H. Fitch, of the Diamond Rubber Company's local branch, and Fred Vanderhoef, manager of the Ford branch. J. H. Beck, whose work as secretary last year was so favorably commented upon, again consented to act in that capacity, so that the success of the show may be considered as assured in advance. Every effort will be brought to bear to make it the biggest thing of its kind the Quaker City has ever seen, despite the great lack of suitable accommodations.

### DATES FIXED FOR CANADIAN SHOWS.

MONTREAL, Sept. 21.—Manager R. M. Jaffray announces March 21 to 28 as the date of the Toronto automobile show, to be held in the St. Lawrence Rink, and April 5 to 12 for Montreal's exhibition in the Arena. To date, the number of applications for space for the Montreal show far exceeds those of last year, and everything points to a bumper show.

### APPLICATION BLANKS OUT FOR BUFFALO SHOW.

BUFFALO, N. Y., Sept. 23.—The sixth annual automobile show under the auspices of the Automobile Club of Buffalo will take place in Convention Hall during the week of March 9 to 14, 1908. The plan of floor and application blanks will be ready in a few days. Dai H. Lewis, secretary of the club, will have charge of the show, as usual.

### BEARINGS DISCUSSED BY A. L. A. M. ENGINEERS.

Ball bearings for use in motors constituted the subject taken up by the Mechanical Branch of the Association of Licensed Automobile Engineers at its meeting in New York City on Monday last. The use of anti-friction bearings has become almost universal in other parts of the car, such as in the gear-set and the wheels, but ball-bearing motors have been turned out by comparatively few makers up to the present. Papers on the subject were read by Frank Stearns of the F. B. Stearns Company, E. T. Bird-sall of the Selden Motor Vehicle Company, and E. R. Hewitt of the Hewitt Motor Company. This subject occupied the entire morning session and it was the consensus of opinion that in view of the great advantages of the ball-bearing over plain types it must sooner or later become standard for all high-grade construction. The elimination of the plain bearing marks a tremendous step forward in motor design, owing to the fact that it permits of the building of shorter motors, eliminates journal friction, reduces the complication of lubrication systems considerably and assures the highest efficiency by its absolute simplicity and absence of wear. The last-named is far from being the least of its advantages, as it does away with the greatest bugbear of the automobile user—loose bearings—and the consequent pounding and loss of efficiency that they entail. It is almost impossible to improperly assemble a ball bearing, and, once in place, there is no tedious process of fitting and adjusting necessary, as is the case with the plain bearing.

At the afternoon session, the report of the Tire Committee was taken up, the particular subject being a two-part detachable rim. Following this, the report of the Test Committee on engine tests was read and proved of great interest. These tests were made on a Thomas Detroit motor at the Hartford laboratory of the association, and it was clearly shown that considerable of the depreciation in power of a motor was due to the friction of the piston rings. Suggestions were made looking toward the elimination of this objection and a discussion of general interest resulted.

### AUTUMN EFFECTS TO DECORATE PALACE SHOW.

In looking about for a motif for the decorations of the combined show of the Automobile Club of America and the American Motor Car Manufacturers' Association and Motor and Accessory Manufacturers, Inc., to be held in the Grand Central Palace in New York, October 24 to 31, the decorators have looked to nature for a setting and will endeavor to create an out-of-doors effect in keeping with the usual environment of the automobile by the liberal use of autumn-colored boughs and leaves banked up against the columns, panels and balconies to form a background for the cars. The number of the latter exhibited will form a startling revelation of the wonderful progress of the American industry, as out of a total of 246 exhibitors no less than 70 will show complete cars.

### MOTOR LEAGUE ACTIVE IN NEW JERSEY.

A State board of officers of the American Motor League is being formed in New Jersey preparatory to the organization of a State division of the league there. Up to the present, 61 members have already been appointed as representatives and other appointments to complete the board will be announced shortly; a chief consul, vice-consul and secretary-treasurer will be named and the complete board convened to complete the work of organization. In organizing the New Jersey State division, the twenty-one counties have been divided into seven districts, each of which will be entitled to a number of representatives proportionate to the membership roll of the league in that district. The work of the new division will be most strongly directed toward securing better legislation, and the number of autoists in New Jersey makes them so important a factor politically that President Potter is confident they can make their influence felt.

# Sky Pilots are Busy These Days

WAITING EXPECTANTLY FOR THE FIRST FLIGHT OF MALECOT'S AIRSHIP.

PARIS, Sept. 16.—Malecot's combination balloon and aeroplane, slightly heavier than the air, is at present the feature of interest in the French aeronautical world. An accidental fouling of the propeller during the preliminary trials near Meaux has postponed the public tests indefinitely. The main gas vessel, 108 feet in length, has pointed ends and a maximum diameter of 23 feet. Within it is a small auxiliary ballonnet, which is filled with air by means of a fan, thus compensating for any loss which may take place from the gas. Below the main gas vessel is a longitudinal openwork girder carrying transverse spars supporting the fabric of the aeroplane, 65 feet in length, and having an area of nearly two hundred square feet. Below this is a cage carrying the Buchet engine driving a single propeller, and beneath this again a basket for the passengers.

Santos-Dumont has decided to fit a three-bladed propeller in place of the two-bladed one formerly used on his aeroplane.

Balloon evolutions above Paris are becoming of such common occurrence as hardly to call for comment. As soon as the army steerable was called in, M. Henri Deutsch de la Meurthe's *Ville de Paris* began evolutions. One of the most successful trips was made this week. Coming out of its shed at about 9 A.M., the balloon evolved above the plain of Sartrouville, descended, changed some of its passengers and steered for the capital. After passing over Chatou, Suresnes and Rueil, a stop of a few minutes was made above the old military fort at Mont Valerien, Paris was entered by the Bois de Boulogne and the Muette, then a huge circle described over the city. The entire trip lasted exactly four hours. Four hundred pounds of ballast remained on reaching home.

LONDON, Sept. 16.—Britain's first military airship, the *Nulli Secundus*, made but a poor impression on its initial appearance in public at Farnborough, and although the weather was favorable did not accomplish its trials without a couple of minor accidents. Its ungainly sausage shape contrasts unfavorably with the graceful lines of the *Patrie*, the *Ville de Paris* or even the older *Le Jaune* of French construction. Structural details are rigorously guarded by the army authorities, but it was naturally impossible to hide its main features from the thousands who gathered on the common to watch its evolutions.

The spherical gas-bag of 60,000 cubic feet capacity is surrounded by a netting and four broad silk bands by means of which three distinct horizontal frameworks are suspended. Power is obtained from an eight-cylinder 50-horsepower motor driving a couple of propellers through long belting running over wire-spoked pulley wheels.

## PREPARING FOR AMERICA'S BALLOON RACE.

Arrangements have been made for a large number of the members of the Aero Club of America to leave New York on the Pennsylvania Railroad on October 17 to witness the race for the Gordon Bennett Aeronautical Cup at St. Louis, on October 21. The club headquarters at St. Louis will be the Jefferson Hotel. Special arrangements have been made by the city of St. Louis, the Business Men's League and the Aero Club of St. Louis to contribute to the success of the visit. The Aero Club of America has appointed a reception committee under the chairmanship of Cortlandt Field Bishop.

## ONE RECORD LOWERED IN FRENCH STRAIGHTAWAY

PARIS, Sept. 16.—On the white band of perfect highway bordered by olive trees, between Salon and Arles, Bablot has succeeded in lowering a world's record with the Brasier racer which he drove in the Grand Prix. His time for five kilometers, flying start, was 1:56 4-5, beating the Mors record by :31-5. The Brasier made the fastest time over the kilometer in :23 4-5, but failed to lower the world's record for this distance. It should be remembered, however, that Hemery, who placed the kilometer on the Salon road at :20 1-5, had the eight-cylinder Darracq which, later, on Florida Beach, attained a prolonged speed which no other vehicle has equaled. Bablot's Brasier was the machine which turned turtle in the Grand Prix when trying to avoid one of the Renault racers on a difficult turn.

Rougier, on the Dietrich which he handled in the Grand Prix and later on the Brescia circuit, in Italy, came second, nearly three minutes behind the Brasier. For this magnificent piece of road-

way, probably the fastest in the world, his machine was not geared sufficiently high. Duray, though expected, failed to make an appearance. A Tourand car had trouble at the starting line which prevented it competing. Rochet-Schneider took third place in both the kilometer and five-kilometer races. Summary of times for the big racers is:

	One Kilometer.	Five Kilometers.
Brasier (Bablot).....	23 4-5	1:56 4-5
Dietrich (Rougier).....	28 1-5	2:04 2-5
Rochet-Schneider (Haeusslin).....	32 1-5	2:38 2-5
Average for kilometer, 93.9 miles an hour; for five kilometers, 95.7 miles an hour.		

Previous years' touring car races have been run on a selling price basis; this year classification was by cylinder area, thus making difficult any comparison between the present and previous speeds. The fastest time made by any tourist was an average of 69.4 by a Radia on the kilometer and 71.7 miles an hour by a La Buire on the five-kilometer stretch.

## ADVERSE DECISION IN TIRE PATENTS CASE

BY his decision, handed down on September 9, Judge Buffington, sitting in the United States Circuit Court for the Western District of Pennsylvania, has brought to a close the first chapter in the long-drawn-out litigation over what are familiarly termed the "clincher tire patents." There are four of these patents, the first of which was granted to Thomas B. Jeffery on July 16, 1891, then of the old firm of Gormully & Jeffery; the second patent was issued on April 28, 1896; the third on January 5, 1892, and the fourth on July 17, 1894, all of them covering means of attaching the shoe or outer cover of a pneumatic tire to a rim without cementing, which was the only method known at the time, this being employed on the so-called Dunlop "rag" tire. In brief, the principal one of these patents, which is the first, covers the familiar "bead" or retaining edge of a clincher shoe and is considered as basic by its owners, while the others cover modifications of the same idea, with the exception of the fourth, relating to the tube. The official title of the action is the G & J Tire Company, Indianapolis, Ind., vs. the Pennsylvania Rubber Company, Jeannette, Pa., and there is a similar action pending against the Michelin Tire Company, in the Southern District of New York, in which no decision has yet been rendered.

By his recently delivered decision in the first-named action, Judge Buffington has left the complainants not a leg to stand on, as he holds in the plainest terms that none of the patents has been infringed. While the G & J Tire Company has been somewhat taken aback at this, it has announced its intention of appealing, and has issued a statement to the effect that, holding that there has been no infringement is equivalent to stating that neither the G & J Tire Company nor any of its licensees have ever manufactured the construction called for by the patents, as the clincher tire manufactured by the defendant is precisely the same as that continuously made by the G & J Company.

The substance of Judge Buffington's decision, which, if sustained, will be far-reaching in its effect, is as follows:

"The rim (A) is provided with hook edges all al, and the figure referred to shows hooks on the rim.—For these provision is made: 'The tire-sheath (C) is provided with correspondingly hooked edges XI CII. In the specifications alone the words hook or hooked are found some seventeen times and other than double hooked connection no other method is stated or suggested. If the patentee or his device contemplated the use of any other means or form of engagement he did not disclose it to the public.

"This combination of sheath and tire in the various modifications of this double hook engagement constitutes the claims in question, and the hooks (beads) on both, in some form, are elements of every claim, of which the first, for brevity's sake, will serve to illustrate, viz.: 'In combination with the rim having recesses open toward the axis of the wheel, the tire sheath having its edges reversed and engaged in such recesses, and the elastic expansible core (tube) between the rim and the sheath, substantially as set forth.' Now in the light of this specification we are clear the respondent's tire does not infringe. The respondent uses other means to hold its tire in place, and its method is not disclosed or suggested in the patent in suit. If the disclosure of that patent comprised all the instructions the tire maker of to-day possessed, it is evident the art would not teach the method followed by both

respondent and complainant in the manufacture of a modern automobile tire. The patentee showed a hook pure and simple. His hook was such that the hooked edges of the rim 'may be turned inward or outward.' His are genuine hooks, so shaped that by virtue of the form and uses of their recesses, increase of disruptive force, whether the hook or rim is bent outward or inward, lessens the possibility of detachment of the interlocked edges. On the other hand, if the edge of respondent's rim is turned outward no pneumatic connection can be made with a sheath, showing that the connections used in the two methods are essentially different. Respondent's device has no hook open toward the axis, nor one in the direction of a tangent to the inflatable core, while air pressure increases the adhesion of its engaging surfaces, yet its method of doing it is not the process of increasing engagement by the catch ends of the patentee's hooks mutually interlocked in holding recesses. In our judgment it would be a miscarriage of the patent system to so construe this Jeffery patent with its specific form of hook connection as to make it cover respondent's device, which is so different from the hook of the patent that even the complainant who owns that patent uses the same method and not the hooked engagement of the patent.

"The second patent is No. 558,956, issued April 28th, 1896, for a wheel tire, claims 5 and 10 of which are alleged to be infringed. Respondent defends on the ground of non-infringement. We are of the opinion the defense is sustained. The subject matter of this patent, its late date in the art and the close differentiations required to obtain the narrowly limited claims in question indicate the patent was restricted to a comparatively narrow field of improvement."

The claims of this patent provide for "tires having inflatable cores; and it consists in the character and construction of the inclosing sheath and the mode of securing the same to the rim." The sides "of the sheath were made of folded canvas or other web, joined at the folded edges to a tread of rubber of sufficient thickness to stand wear and sufficient elastic flexibility to adapt it to yield with the core, and having also tensile elasticity, so that the sheath which comprises it at the middle section is transversely extensible to a slight degree."

Claims 5 and 10 of this patent both provide for beads extending inwardly so as to be held between the core (tube) and the rim.

"In the respondent's device, however, the sheath ends with its two peripheral side connections with the rim," reads the decision. "No theory or ingenious connection can change that fact, and fact, not theory, is the test of infringement. Accordingly we hold respondent does not infringe.

"The third patent is No. 466,565, issued January 5, 1892, for a wheel tire, claim 7 of which is alleged to be infringed. The defense is non-infringement. It is a device for fastening a tire sheath to a rim by means of hooks, five different modifications of which are shown in the drawings. The respondent, using no hooks to make its connection, does not infringe.

"The fourth patent is No. 523,314, issued July 17th, 1894, for a wheel tire, of which Claims 1, 2 and 3 are alleged to be infringed. The defense is non-infringement. As pertinent to the present case the patent was for a tire provided with an auxiliary wedging device. This consists of a circular ribbed ring, preferably of soft rubber, cemented to the inner periphery of the tube. Now the respondent has neither ring nor rib on its core, but it is alleged to infringe by the use of small butterfly bolts placed at four quadrant points and clamped to the rim by a rigidly fixed bolt and nut with a set-screw and serving to keep the sheath in place on the rim should the core become deflated. The bolt is not affected by either tire inflation or deflation. It is thus clear that its functions and structure are wholly diverse from the ringed rib of complainant's patent, and performs a wholly different function."

## RECORD FIGURES IN 24-HOUR RELAY RACE.

MILWAUKEE, Wis., Sept. 21.—New figures were put up in 24-hour relay races by the performance of the Locomobile team of four-cylinder, 40-horsepower cars driven by Drach and Leiser. In two rounds of the clock 1,146 miles were covered, breaking the relay record of 1,135 miles, made by the Ford team at Detroit last June. The Locomobile also made the fastest time for 100 miles, covering that distance in 2:01:09. A Mitchell, driven by Friend and Brown, was second with 914 miles to its credit; a two-cylinder Buick was third with 884 miles. Alto-

gether there were seven starters: Locomobile, Jackson, Buick, Mason, Cadillac, and Wayne. The Loco was first at the end of the initial round and had no difficulty in maintaining its lead. The Jackson had carbureter troubles at an early hour, and, there being no relief car present, had to abandon the contest. The Wayne was in a similar difficulty when engine trouble came its way. During the tenth hour the Mason car went through the fence, its driver, George Dusenberg, suffering a broken collar bone. The Cadillac was withdrawn during the fifteenth hour.

### THE NEW IMPERIAL TO BE AT THE PALACE.

One of the new cars to be uncovered at the coming Grand Central Palace show in October will be the Imperial, made by the Imperial Motor Car Company, Williamsport, Pa. Though it began operations a year ago, the company has made haste slowly and this is but its second model, which is designed on larger and more powerful lines than the first. The motor is of the company's own design and is conservatively rated at 35 horsepower. It is fitted with an Eisemann high-tension magneto and double ignition system. The clutch is a metal-to-metal floating ring, with cork inserts, while one of the features of the car on which its designers have lavished a great deal of attention is the double drop frame, giving a "straight line drive," bringing the crankshaft of the motor and the rear axle on practically the same plane when the car is carrying its normal load, thus avoiding a great deal of friction and consequent rapid wear at the universals. A four-speed and reverse gear-set with selective type of operation is fitted, drive being by propeller shaft. An I-beam front axle is employed and a floating rear, the running gear having 36-inch wheels. The lines of the car are pleasing, as will be evident from the photograph illustrating the Imperial roadster, in which Fred P. Brand, vice-president and general manager of the company, is at the wheel, and Superintendent William I. Glasby

MANAGER FRED BRAND AT THE WHEEL OF THE IMPERIAL.

is seated beside him. The first model has been used continuously for the past year as a demonstrating car over the Pennsylvania mountain roads and their "thank-you-marms" and has not been in the shop a day.

### TRANSCONTINENTAL DRAGON IN HARD LUCK.

One misfortune after another has so served to delay the Dragon car in which Charles A. D'Arcy left San Francisco on September 4, in the attempt to make a new transcontinental record, that the prospects of lowering the latter have practically vanished, despite which Mr. D'Arcy and his crew will bring the car through to New York. On Sunday last, September 22, the car passed through North Platte, Neb., which means that by far the worst part of the trip has been left behind. Some of the troubles encountered included getting stuck in a quicksand, being stalled on the desert and suffering the loss of two of the drivers, not to mention wrecking the differential, which, however, was replaced by a spare one carried on the car. The car is being driven by D'Arcy and Theodore Hartenstein and they were accompanied at the start by Benjamin W. Turner and Frank Sexton. The route followed paralleled the tracks of the Central Pacific, Union Pacific and Chicago & Northwestern roads as closely as possible, and this will land the party in Chicago, from where the northern route through Indiana, Ohio and New York State will be followed to New York City.

Six-cylinder automobiles will be made by the Newcastle (Pa.) Automobile Company, a new concern headed by Daniel Morgan, of Pittsburgh. A factory will be erected.

THE BERLIET "SIX" PARTY LEAVING GOTHAM FOR CHICAGO.

### A BERLIET "SIX" OFF ON A TOUR.

Although it was Friday the thirteenth—a combination generally held to be particularly ominous for the undertaking of an enterprise—that fact did not deter a party that left New York for Chicago on that day in a new Berliet six-cylinder car, bound for Chicago. H. C. Townsend at the wheel, F. M. Hoblitt and Arthur N. Jervis of the American Locomotive Company, accompanied by Enoch Rector and B. C. Buxton, secretary and treasurer, respectively, of the W. W. Shaw Company, Chicago agents for the Berliet cars, comprised the contingent which thus set superstition at defiance. After a short stay in Chicago, St. Louis, Indianapolis, Cleveland, Buffalo, Pittsburgh, Philadelphia and a few other cities will be visited on the return trip, arriving back in New York about the middle of October.

### A RECORD-BREAKING LOAD FOR CLIMBING.

It is one thing to take a car up a mountain on the high gear, but quite another to pile in it and on it all the load that it can possibly be made to carry and then accomplish the same feat, so that the makers of the Pennsylvania are justly proud of the performance of one of their cars in climbing Never-Sink mountain, near Reading, Pa., "loaded to the gunnels," so to speak, as shown by the accompanying photograph. There are many stretches that are extremely stiff, aggravated by sharp turns, and at the time the car was sent up the surface was badly cut up by washouts, which had been refilled with loose, soft earth. The entire distance was covered without the necessity of changing gear. The human load consisted of Philadelphia newspaper men who were there to see and observe as well as to be carried.

LOAD OF SCRIBES THAT THE PENNSYLVANIA CARRIED.

WHAT THE LOZIER CAR ENCOUNTERED IN NEVADA.

### IN THE WILDS OF THE GOLD-MINING COUNTRY.

Nothing has proved such a boon to the prospector as the automobile, and, high as the price of gasoline on the Western deserts and in the mountains, miles away from the nearest railroad, it is cheap compared with the expense of muleback travel. C. W. Feigenspan, of Goldfield, Nev., is a prospector who finds his Lozier car particularly valuable in this class of work, to which he has been devoting it steadily in California and Nevada for the past three months. The illustration is from a photograph taken in the Nevada wilds. Mr. Feigenspan shortly expects to drive the car overland to New York, but that will not make one automobile the less in Goldfield, for as a result of his success L. W. Stevenson, president of the Southern Pacific Railroad, recently invested in a 40-horsepower Lozier and will drive it out there.

### HASTINGS RETURNS FROM ENGLAND VICTORIOUS.

Theodore K. Hastings, who went abroad early last summer to compete in the 1,000-mile endurance contest held under the auspices of the Autocycle Club of Great Britain, returned last Thursday on the *Oceanic*. The tour was held from August 19 to 24, start and finish being near London, while the route lay for a large part through Wales and its picturesque hills. Hastings was among the first five to finish and received two gold medals, one for his performance in the contest and the other for the neat appearance of the two-cylinder Indian motorcycle which he rode, a prize having been offered for the best appearing and best kept machine. He had a perfect score in the contest, his mileage being 1,002. Of the 39 starters, but 15 finished, and Mr. Hastings expressed himself as so well pleased with his trip that he will repeat it next year.

HASTINGS CHECKING AT ONE OF THE CONTROLS.

### KNOX NAME BELONGS TO OLDER CONCERN.

SPRINGFIELD, MASS., Sept. 23.—By an injunction issued in the Superior Court in the case of the Knox Automobile Company vs. the Knox Motor Truck Company, the latter concern is ordered to cease doing business under its present name or any name of which the word "Knox" is a part. The decree was issued in response to a bill of equity filed about two years ago in which it was alleged by the Knox Automobile Company that the Motor Truck Company in using the word "Knox" was leading to a confusion on the part of the public between the two cars and an injury to the plaintiff's business.

In the memorandum accompanying the decree Chief Justice Aiken finds in support of the contention of the plaintiff that confusion between the cars of the two companies must necessarily arise, and also that whatever reputation in the automobile business is attached to the name "Knox" is due largely to the Knox Automobile Company.

The court reviewed the facts brought out in the hearing relative to the association of Harry A. Knox with E. H. Cutler and others in the Knox Automobile Company, incorporated in 1900. In 1901 Mr. Knox conveyed by a bill of sale to his copartners his entire share of the business, giving them full title by a bill of sale to all the company's assets, and in 1904 disposed of all his stock in the company. Immediately afterward the rival concern was started, the defendants in the present case.

C. H. FOSTER AND HIS GABRIEL HORN CHIMES.

### MAKING MUSIC FROM THE EXHAUST.

That the automobile, as representative of the most up-to-date method of transportation, has also been responsible for similarly progressive ideas in advertising was never better illustrated than by the recent 6,000-mile trip made by C. H. Foster, of Cleveland, O., to introduce the new 28-chime Gabriel horn, as well as to demonstrate the qualities of the Foster shock absorber. The horn is really a pipe organ on a small scale and, despite the restricted space limitations offered by an automobile, Mr. Foster has devised a regulation keyboard on which almost any composition can be rendered with its full chords, though there are but few more keys than three octaves. The principal cities in Michigan, Wisconsin, Illinois, Indiana, Ohio, Massachusetts, Connecticut and Rhode Island were visited as well as New York City, where performances while en route through Central Park, and on Coney Island's bowery, caused no end of astonishment. Old timers thought the steam calliope had been revived in a far more refined shape and run by gasoline, though it is considerable of a mystery to the average observer as to just what does form the operative power of the compact and inconspicuous instrument. Its appearance on the car is shown by the accompanying illustration, though neither this nor an actual view of the car itself gives an inkling of just how the player performs except upon a view from the left hand side.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Design patent has just been allowed Gray & Davis, Amesbury, Mass., on their new 1908 searchlight. Its design and character was so distinctive that patent was allowed without question.

The Toledo plant of the Pope Motor Car Company has been ordered closed for the purpose of making an inventory. It is expected that about two weeks will suffice to do this and that the plant will resume operations at the end of that time.

The Seitz Manufacturing Company has been voted \$10,000 by the city council of Monroe, Mich., and will erect a factory there. The company will make a new commercial vehicle, a special feature of which will be the transmission equipment, the inventor of which is the president of the company.

In the automobile parade in Buffalo during Old Home Week, much attention was attracted by the first carriage built by the Babcock Electric Carriage Company, of that city. The vehicle is still in daily use, and is stated to have traveled more than 70,000 miles. It is used by some of the factory officials, and was driven in the parade by A. H. Kime.

The Glide Club, recently organized at Peoria, Ill., held its initial club run last Sunday. The rendezvous was Lake Senachwine, fifty-two miles from Peoria, where the party was entertained at the Undercliff Hotel. Ten Glide four- and six-cylinder cars are reported to have made the round trip without adjustments of any kind, and all returned on schedule time with perfect scores.

An interesting business trip of about 6,000 miles has just been completed by W. B. Fewell, western representative of the Locomobile Company of America, in the 1908 40-horsepower car. The start was made from Bridgeport, Conn., and the route covered was from New York to Albany, through the State to Buffalo, then to Cleveland, Columbus, Cincinnati, Wheeling, Pittsburg, Bedford Springs, Gettysburg, Harrisburg and Philadelphia. The principal reason for the trip was to show the 1908 product to the agents.

For the purpose of enlightening the purchasing public on the mechanical construction of 1908 models, and the principal changes from 1907 to 1908 cars, the American Motor Car Manufacturers' Association has engaged the services of Charles E. Duryea, who is recognized as one of America's leading mechanical experts, to write comprehensive mechanical data for the Association's members. As Mr. Duryea is one of the pioneer auto builders of the country, and an authority on gas engines, his articles will attract widespread attention.

John Wilkinson, chief mechanical engineer of the H. H. Franklin Mfg. Co., Syracuse, N. Y., and designer of Franklin automobiles, will probably never overcome his tendency to make peculiar and special experiments. A few days ago he tried out a 1908 Franklin by taking off the air fan, placing a blanket over the hood, loading the car with 700 pounds of lead, and making a run of thirty miles to his country residence, just to see if he could overheat the air-cooled car. Although successful in many of his ex-

periments he is reported to have failed in this particular instance.

The new home of the Matheson car, a concrete and steel building of imposing proportions, five stories and basement, located on Broadway, between Forty-ninth and Fiftieth streets, and running from Broadway through to Seventh avenue, will soon be ready for occupancy. It is opposite the present quarters of the Palmer & Singer Mfg. Co., the distributors of the Matheson car. The building is so constructed that three stories additional may be built on whenever necessary. The decorating and finish, both within and without the building, are highly artistic. The upper floor has been arranged as a repair and stock room; three intermediate floors will be used for the garage, and are capable of accommodating 150 cars; a magnificent salesroom, 36x40 feet, with a mezzanine balcony and offices, will be located on the main floor. The building is provided with two large elevators, each having a lifting capacity of 12,000 pounds.

### RECENT BUSINESS CHANGES.

The Brooklyn Motor Car Company, 1384-1386 Bedford avenue, Brooklyn, N. Y., has incorporated, and will hereafter be known as the R. E. P. Sporting Goods Company. The company's line will not only be comprised of auto supplies, but will include everything pertaining to the outfitting of a sportsman.

The Walter Automobile Company has placed E. S. Lea in charge of its agency in Philadelphia. Mr. Lea was formerly connected with the company's factory at Trenton in a prominent capacity. In addition to handling the Walter and Darracq cars, the Philadelphia house will also carry a line of Belgian motorcycles.

A number of changes in the location of auto dealers in Worcester, Mass., are being made. The Robinson garage on Church place, on the west side, is to be taken and managed by the Worcester Motor Car Company, a new entrant in the field. George H. Phelps, agent for the Corbin car, is to have a garage at Newton square. The Pond Auto Station, which has an uptown office at 186 Main street, and its garage on Assonet street, will have a new garage on Allen court, just off Main street, at Franklin square.

### NEW AGENCIES ESTABLISHED.

The New York agency for Continental motors, manufactured by the Continental Motor Company, Muskegon, Mich., has been placed with Thomas J. Wetzel, 29 West Forty-second street.

Sheldon W. Case, agent for Holsman automobiles in Newark, N. J., and vicinity, has opened a show room at 292 Halsey street, that city. Last year Mr. Case conducted the Holsman sales from his Montclair office, which will be retained, making two salesrooms for the car in the territory.

The New York agency for the Atlas two-cylinder runabout, made by the Knox Motor Truck Company, Springfield, Mass., has been placed with C. H. Martin, formerly of Martin & Company,

consulting engineers on commercial vehicles, who has opened headquarters at 31 West Forty-second street.

The Lozier Motor Company makes the following announcement of new agencies placed for 1908: For Jersey City, with George Blakesley, president of the Crescent Automobile Company, who is one of the pioneer dealers of Hudson County, N. J.; for Cincinnati, the Sid Black Automobile Company, who last year handled the Lozier and Franklin and other lines, and will this year confine its attention to the Lozier and Franklin exclusively; for Columbus, O., and vicinity, the Orlando-Kessler Company.

President Horace DeLisser, of the Ajax-Grieb Rubber Company, who is now making an extensive tour of the country, has opened the following Ajax tire branch houses: In Chicago, at 1418 Michigan avenue, in charge of G. J. Durwell, formerly branch manager for the International Tire Company; in Detroit, in charge of Charles Hatch, formerly branch manager in that city for the Hartford Rubber Works, and prior to that time with the Diamond Chain Company. Mr. DeLisser is now en route to California, where he will establish other branches.

### PERSONAL TRADE MENTION.

F. C. Chandler, manager of the foreign department and the western agencies of the Lozier Motor Company, is making a tour of the western cities. W. S. M. Mead is visiting the eastern Lozier agencies.

Leo Melanowski, formerly identified with the Dragon car, and, until recently, chief engineer of the Aerocar Company, Detroit, Mich., leaves to-day on *La Lorraine*, accompanied by his wife, for a four months' visit to the automobile factories of France, England, Germany and Italy.

### ERNEST KELLY'S DEATH.

By the unfortunate death of Ernest Kelly recently at Sacramento, Cal., the Dragon Automobile Company has lost a valuable helper, and a large circle of friends mourn a genial spirit. Ernest Kelly, who was one of the traveling sales managers of the Dragon concern, had gone westward to straighten out some business for his company. During his stay in Sacramento he undertook to drive Percy Walker's Thomas Flyer in a match with Fernando Nelson's car of the same make, handled by Bert Dingley. Owing, it is thought, to the dusty nature of the track, Kelly drove into the fence when traveling almost sixty miles an hour. The machine broke through the barricades, struck a ditch, then threw the driver some fifty feet. Although seriously injured, Kelly regained consciousness at the hospital sufficiently to talk cheerfully to the doctors, but later lapsed into unconsciousness and passed away.

Last winter Ernest Kelly gained prominence by piloting a Thomas car in one of the longest non-stop runs held in this country. One of his last tasks with the Dragon people was the starting of the transcontinental Dragon which is now crossing the continent.

INFORMATION FOR AUTO USERS.

**Town and Country Driving Boots.**—Handling the wheel of a car in winter weather, or sitting in the tonneau, is pretty cold work, particularly for tender extremities, and to avert this unpleasantness Guiterman Brothers, Saint Paul,

GUITERMAN'S DRIVING BOOTS.

Minn., are marketing a special type of fur-lined boots for both men and women. They are designed to pass over the ordinary shoe readily and extend considerably above its top, thus affording thorough protection to both the ankles as well as the feet. The type illustrated is 17 inches high and is known as the Czar boot; it is made of black leather, as shown in the illustration, with a heavy oak sole and heel. Other types, such as the "Romeo" and "Dixie" are made 9 inches high, the first named in tan with light, flexible sole, and the second, in two types of black with flexible or stiff, heavy oak sole and heel. For women, the "Juliet" style comes in two heights, 11 and 14 inches, in tan or black leather, both having light, flexible soles. They are ordered by giving the regular shoe sizes of the intending wearer.

**Brandow Spark Indicator.**—This is a device designed to aid in the location or discovery of ignition faults, and is the invention of Dr. Frank W. Brandow, of Pittsfield, Mass., formerly president of the Berkshire Automobile Club, and in-

BRANDOW INDICATOR APPLIED.

ventor of the Brandow lock switch. The indicators are readily attached to any type of spark plug, and, when not in use to test the ignition, are left closed, as they are not intended to form spark gaps. They are permanently attached to the engine, one at each plug, and are accordingly always ready for use. To adjust vibrators, or test a unit of the coil, the indicators are opened about 1-4

inch, while, to time the engine, they are opened but 1-8 inch. Weak batteries are shown by the indicators by an occasional miss, while faulty carbureter adjustment is revealed by irregular firing in spite of the spark passing constantly, the indicators being open about 1-8 inch; for magneto testing they are opened 1-4 inch. The device is being manufactured and marketed by the Brandow Combination Lock Switch Company, 86 North street, Pittsfield, Mass.

**Vim Spark Plug.**—This plug, which is just being put on the market by the K-W Ignition Company, Cleveland, O., embodies many radically different ideas in plug construction. The chief of these is the elimination of all packing and the substitution of ground taper joints

NEW VIM PLUG.

which are absolutely gas tight and are maintained so in spite of the expansion and contraction of the different parts by being subjected to the tension of a helical steel spring. To insulate it, the central stem of the plug is surrounded by a heavy wrapped mica tube, which fits into the center of an unglazed porcelain tube, thus making it a combination mica and porcelain plug, having all the advantages of the high insulating properties of both these materials without their drawbacks. Surrounding the large taper joint, near the hexagon nut, is an annular pocket extending for a considerable distance along the porcelain core. The old or burnt mixture is compressed back into this space, allowing an ample volume of new mixture to surround the spark gap part of the brass nozzle. The latter confines the mixture within the plug, so that when the spark occurs at the gap, it explodes the

new mixture confined in the plug and shoots a blast of flame out through the nozzle into the cylinder. The Vim plug is claimed by its makers to be absolutely soot-proof as the result of this construction.

**Mexican Graphite Auto Lubricant.**—This lubricant is intended for general automobile use, and is said to be absolutely uniform, gritless, dripless and free from precipitation, and it can be employed wherever oil is used, such as in the gear or differential case, wheel hubs and similar situations, with great economy, owing to the absence of dripping. This gritless graphite powder is manufactured by the United States Graphite Company, Saginaw, Mich., from graphite of their own mines in Mexico, and its specific advantages lie in the fact that it is reduced to an impalpable powder by an elaborate system, and is then combined with the proper lubricating oils and solidified to the right consistency for automobile use. In this state it has a great affinity for oil, and in consequence possesses great power of adhering to bearing surfaces, which makes it very valuable as a lubricant. The compound is about the consistency of

non-fluid oil and carries exactly the proper proportion of the powdered graphite, a result that, the makers state, is difficult, if not impossible, to obtain by hand mixing.

**Herz Ball-Bearing Timer.**—For 1908, Herz & Company, 203-205 Lafayette street, New York, are bringing out a timer to be known as the 1908 Excellent Standard. This is an improved design, mounted on ball-bearings throughout, and is self-adjusting. All parts are in-

SECTION VIEW HERZ TIMER.

terchangeable, of the best materials and the most accurate workmanship. In the illustration, A is the steel base and advance lever with hardened cups for the ball bearings B, while C shows the rotating center sleeve with the contact plunger F, this sleeve being fastened to the camshaft or timer shaft by the set screw D. H is a collar fastened on the sleeve by means of two set screws, holding a specially designed screw G, which presses against the lower cone E, thus making the device self-adjusting, by taking up both lateral and endwise movement. The cone flanges are fitted close to the bearings to make them dustproof. I is the hard rubber insulation containing the contact K of laminated tool steel plates with a brass sleeve, into which the terminal L is pressed. The latter is reversible and can be attached either from the top or bottom. The wire M is attached to the terminal L by laying it over the outside and screwing in through the threaded hole.

**An Improved Carriage Lock.**—A security locking handle which should be well received by all automobilists interested in the minor perfections and luxuries of their cars has just been put on the market and is handled in New York City by the Auto Supply Company, 1733 to 1737 Broadway, New York City. The lock is combined with the handle, obviating the necessity of a separate lock with keyhole on the door frame and cut away on the pillar. Each pair of handles includes two keys, which fit either handle. The locking device in each pair differs so that none of the keys will fit any but the handles for which they are made. This safety locking handle can be used with any ordinary lever lock and, being interchangeable, an ordinary handle may be replaced by it in a few moments.

## Morris Park's Concluding 24

Marred by Fatality and Accident. Winner: Fiat of Italy.

FIAT, driven alternately by Cedrino and Parker, ran up the highest score in the second twenty-four hour race, held September 27-28, at the Morris Park track. The 984 miles to the credit of the Italian machine when Official Wagner fired the pistol shots which announced the termination of the long struggle made victory an easy one, for Studebaker was far behind, with 878 miles, and the Itala had 873. The Renault record of 1,079 miles remains unbroken, but it should be mentioned to the credit of the contestants in the last event that for six hours they had to struggle in a drenching downpour of rain, which rapidly transformed the dirt track into a quagmire. Goggles could not be worn when ploughing through the sea of mud and water, with the result that every driver on the track suffered intensely from the effects of the dirty mess thrown into his face at every turn of the wheels.

With one fatal accident to record, that of L. W. Smelser, the pilot of No. 3 Lozicr, and several very narrow escapes on the

part of drivers and spectators, the question involuntarily arises: "Is the game worth while?" The man who lays down his dollar for thrills probably has no reason to grumble at his bargain, but every person with an interest in the welfare of the industry, or any knowledge of racing in its most wholesome forms, will declare unhesitatingly that, as at present conducted on improvised horse tracks, this form of contest is harmful.

There was but one absentee at the starting line when the competitors were lined up in four rows opposite the grandstands and sent away by Wagner at intervals of five seconds. The missing one was the Renault with which Paul Lacroix and Meurice Bernin established the record of 1,079 miles at the last meeting. While attempting a Chicago-New York record a few days ago, Bernin was struck by a non-skid band, which came off the tire when traveling at a rapid rate. The injury, though not of a serious nature, was exceedingly painful, causing the driver to abandon his cross-country run and withdraw his engagement

VIEW OF MORRIS PARK, TAKEN SATURDAY MORNING WHILE THE RACE WAS IN PROGRESS AND BEFORE THE ACCIDENT HAPPENED WHICH CAST A GLOOM OVER THE WHOLE AFFAIR.

in the Morris Park race. Lacroix took consolation in a challenge to the winner of the race and also to the Thomas victor of the Brighton Beach "24."

At the outset a very rapid pace was set, the Dietrich running off 52 miles; the Simplex and Lozier No. 3, 50 each, and a number having well over 40 miles to their credit at the end of the first hour. It was obvious that such a rapid rate of travel could not be maintained on the track, for although lighting was better than ever before, some oiling had been done, and a little attempt made at banking, the turns were still in bad condition. Few of the drivers appeared to have a just appreciation of the speed which they could reasonably hope to maintain during two rounds of the clock, danger-courting driving and playing to the gallery being more common than sane handling of the machines on a makeshift track. Gas lamps were used almost exclusively for both head and rear lights, consequently there were few stoppages to light up during the night. Whenever a stop was made it was always because of broken piping or rubber tubing having slipped off the metal ends. No. 6 Matheson was the first to abandon the contest, after two hours' running. The penalty for excessive speeding on turns had soon to be paid in the shape of time lost for changing tires, and business began early at the big camp installed below the stands.

One of the features of the organization of the race was the attention which had been given by nearly every entrant to the fitting up of the repair tents and providing accommodation for the helpers. The Diamond Tire Company, which supplied all the contestants but three with tires,

had a well-organized establishment in charge of G. A. Davidson. A solid wood platform gave a secure standing ground on which to work on the cars, one large tent held a quantity of tires, and smaller ones were used for lodging the workmen. Lighting, too, was satisfactory. Instead of a single tent in which men slept, ate, worked and fell over one another in busy moments, there were a number of large, well-lighted tents, with tools laid out on tables, spare parts aligned carefully, and gasoline and water cans filled and painted in such a way as to avoid confusion in the exciting moments when a car ran in for repairs. In front of the improvised workshop, too, stout floor boards had been laid down and guarded off by ropes. Smaller tents close by provided sleeping accommodation for the staff of mechanics.

The Lozier people had even gone one better with a private checking station opposite the camp, where the passage of each of the firm's cars was recorded mechanically, and where the cream-clad drivers were given their position round by round by the aid of luminous signs. At the opposite end of the line Matheson had a private signaling system to their drivers.

Vigorous efforts were made by officials, police and a squad of Pinkerton men to keep the paddock clear of idlers. With large gaps through which healthy inquisitive youths could crawl with little difficulty, the task was not always an easy one, but the routing out was zealously performed by the big stick brigade.

At the end of the third hour the two Loziers had got a good lead with 143 and 146 miles respectively, followed by Vaughan on the Stearns, with Fiat, Allen-Kingston, Darracq and Motobloc closely bunched. Smelser continued to maintain a high rate of speed, covering 44, 46, 47 and 49 miles in the hour, until the seventh, when he lost time, and Cedrino on his Fiat drew level. At the end of the ninth hour the Italian had a lead of eight miles and from this point onward continued to draw away from the crowd until the end. At the end of the sixteenth hour the Fiat had got ten miles ahead of the Renault record for that time.

#### How the Improvised Track Claimed Its Victim.

Near the end of the thirteenth hour L. W. Smelser, who had driven the Lozier No. 3 continuously from the start, and was then in eighth position, crashed through the barrier at the upper turn and received such injuries that he died an hour later at the Fordham Hospital. According to the Lozier people, the right front tire blew off the rim through taking the turn from the back stretch at too high a speed. It was impossible to swing the machine round with the deflated tire hanging to the wheel, and it rushed straight ahead into the barrier marking the limits of the track. The top bar of the hedge consists of a stout metal pipe used for carrying water when the course was the scene of horse racing. The car passed under this, the top of the radiator being damaged in the passage. Fred Hall, Smelser's mechanic, being rather lower than the driver, passed under this pipe and escaped injuries. Smelser either dodged too late, or was too tall to escape the pipe, for he struck it with his head and fell from the machine unconscious. Doctors on the field gave the necessary attention immediately and the unfortunate man was hurried to the hospital, where he died an hour later.

A couple of spectators, who had no business near the inner rail, were struck by the machine, and sustained injuries which fortunately were not of a very serious nature. By breaking through the barrier and running across the grass land before it pulled up, the front of the machine was considerably wrecked, but after examination of the parts the Lozier experts are emphatic in declaring that no part of the steering gear broke and that the accident can alone be attributed to the tire pulling off the rim through taking the slightly banked turn on loose earth at too high a speed.

As soon as news came that Smelser was dead, Mr. Lozier ordered the companion machine, driven by Michener, to withdraw from the contest; it was then in fifth position. L. W. Smelser was junior member in the firm of the Linkroum-Smelser Automobile Company, of Newark, N. J.

STUDEBAKER CONTESTANT WHICH FIGURED AS SECOND SURVIVOR.

PRECAUTIONS TO KEEP ONLOOKERS OUT OF DANGER ZONE.

Both Mathesons had gone out during the night, Nuneman's Darracq was in the paddock with a couple of cylinders taken down, the driver declaring that the clumsy mechanic had pumped air instead of oil into the engine; Mack's Dietrich, after the fastest initial round of the meet, had to be doctored at frequent

a remarkably lucky manner. At the time of the spill four other cars were following the Packard on the turn and for a moment there were prospects of a serious mix-up. Fortunately, however, all steered clear. Compared with the last race held on the Morris Park track, this turn appeared to be particularly bad.

intervals by a team of French mechanics; the Welch had furnished little since it cast a shoe and went into the inside fence. With this reduction, added to the departure of the two Loziers, the track at times had a deserted appearance during the forenoon.

Excitement was provided about 1:30 when, on rounding the turn past the grandstand, Stuart Elliott's Packard rushed into the inner fence, rolled over on its left side and threw Embleton and his mechanic on the grass. Embleton was severely bruised and cut, but, considering the nature of the accident, escaped in

At the end of the eighteenth hour the race was called off for repairs to the track, short distance events being held in the interval. They were of little interest, however. Rain had fallen during the interval, and soon after the re-start continued to descend in such force that an effective stop was put to fast driving. The rules of the race demanded that those machines continuing in the contest should draw up opposite the grandstand and that no work should be done on them during the interval, an official being told off to enforce the regulation. Yet at the same time

DIAMOND TIRE CAMP WAS A BUSY PLACE MUCH OF THE TIME.

six cars were in the paddock undergoing extensive repairs and were allowed to come to the track after the re-starting of the contest and continue with the others. Even with these two hours'

gratuitous repairs the favored ones were never in danger of capturing first place, but they certainly got a position on the finishing list they would not have had under a just enforcement of the rules.

This one-sided justice practically allowed any machine which needed to renew its parts to run into the paddock a few minutes before calling an interval, receive every attention while there, and come out to compete with others forbidden to make repairs except during running time. Mack's Dietrich, whose mileage had stood at 393 from the ninth to the eighteenth hour, came out after the interval and carried off a special prize of \$20 for the highest mileage in the nineteenth hour. After this spurt it added one more mile to its score and retired permanently.

#### Continuous Rain Drove Spectators Home.

It was a persistent downpour which accompanied the re-starting of the struggle; a drenching rain which drove all but the most enthusiastic spectators homewards and made drivers and helpers hurry into rubber clothing, hunt round for chains, and cut down their speed by nearly one-half. There was no further doubt as to the result of the race. Fiat had a lead of 78 miles, was running with the regularity of clockwork, and had absolutely nothing to fear from any of her rivals. Cedrino, who was relieved occasionally by Parker remained the larger part of the time at the wheel, had handled the car in a masterly manner, maintaining an average of about forty-six miles an hour—which is probably all that can be got out of any car with the track in its then condition. The record of the Renault, which, like the Fiat, was kept within its limits, tends to confirm this. Instead of placing the gasoline tank at the rear, the Fiat people had hung it on the outside of the left frame, where it served to preserve the balance of the car on the bends. The Fiat was equipped with Michelin tires which gave no trouble whatever.

#### Most Drivers Were Cautious in the Rain.

With the rain Cedrino wisely cut his speed down to 29 miles for the first hour, then lowered it to 26 and again to 24, increasing it to 25 during the last hour. It was probably due as much to add to his own comfort as to a desire to save the machine, for a few miles an hour more on the flooded track must have added considerably to the discomfort of the drivers.

Zumbach and Carriere, who alternated at the wheel of the Itala, made prodigious efforts to get ahead of the Studebaker during the last six hours. Thirty-two miles behind on the recommencement of the race, the distance between the Italian car and the Studebaker was gradually diminished until at the end of the race there were only five miles between the two. The

LINE UP FOR THE RE-START SATURDAY AFTERNOON; DARRACQ, FIAT, SIMPLEX, STUDEBAKER, AND ITALA.

PHOTOGRAPH TAKEN IMMEDIATELY AFTER THE PACKARD ACCIDENT, THE DRIVER OF WHICH IS BEING ATTENDED BY POLICE OFFICERS.

foreign drivers sacrificed themselves and took every chance with the machine, rounding the curves in a manner which sent a thrill through the few spectators peering at them through the blinding rain. Zumbach suffered so much from the driving mud that he had to leave the car during the last hour and call a doctor to attend to his eyes.

As soon as the competitors were stopped and drawn up at the judges' stand Cedrino made a request for his prize money, explaining that he had heard that at these events the drivers were not always paid. He was given satisfaction on the spot. The Studebaker, 106 miles behind the Fiat, secured second position, solely through regularity of running. It was not the fastest of the cars on the track, but gradually worked up from a low position to the highest but one, owing to consistent work. Frayer-Miller was declared to be suffering from carbureter troubles; certainly she never showed the speed expected of her, and during the last few hours was frequently away for long periods. Allen-Kingston had a stationary mileage for four hours, but did not take the unfair advantage of remaining in the paddock during closed time. There were three hours during which Vaughan's Stearns remained stationary, while Schlipp's Stearns had no better record. Poole and Robertson on the Simplex were kept down considerably by tire trouble. The Darracq driven by McCulla practically retired at the twentieth hour, then added one mile to its score during the last few minutes of the race. Motobloc suffered from radiator troubles, had no staff to attend to the car when it put into port, and finally wasted a lot of time fitting mud guards.

**Record Trials and Various Short Races.**

During the afternoon interval an uninteresting race was held over twenty laps of the cross-country course inside the track, the competitors being Wallace Owen in an American Mors, Ned Crane in an English Daimler, and Arthur Rowley in a Dietrich. The Mors won. Robertson drove the big Vanderbilt cup Hotchkiss racer round the course a couple of times, then decided that it would be folly to attempt records with the track in its condition. Nuneman, on the Darracq with which Hémery won the Vanderbilt Cup, had no such scruples, and after a few practice spins made a trial against time, result being 0:58 for the mile.

Robertson made an attempt to lower the mile record on the Friday afternoon preceding the big race. He drove the Hotchkiss Vanderbilt Cup racer, and was clocked in 52 seconds, lowering the gasoline mark for Morris Park. A three laps race, about 4.17 miles, for four-cylinder Ford runabouts, was won by Frank Dunnell, Walter Livingston second, and E. Rogers Stearns third.

Wallace Owen won the 10-mile road race over the cross-country course with an American Mors; Ned Crane was second in the English Daimler, and Charles Trewin third on a Welch.

Seven of the new Darracq taximeter cabs lined up in a race which was won by Stephen Brown. No time was taken.

The twenty-five mile race open to stock cars of 60-horsepower or less was won by Guy Vaughan driving a Stearns, time 27:54 1-5; George Fentie on a Packard was second in 28:39.

## BROOKLANDS TRACK HAS ITS FIRST FATALITY

LONDON, Sept. 23.—Brooklands track, the only one of its kind in the world, and specially built for safe racing at speeds up to 150 miles an hour, has proved that it has elements of grave danger. At the fourth meeting Mr. Herman, a member of a London firm of automobile dealers, met his death while driving the Minerva car with which Moore-Brabazon was victorious in the recent Ardennes circuit race under German Emperor rules. The sixth race had come to an end with the Minerva machine in about sixth position on the straightaway finish. It is not always possible to pull up on the straight, and Herman ran onto the banked portion, as is very frequently done. Probably owing to inexperience, for it was his first race on the track, he ran too far up the bank. It would have been possible to gradually drop down to the inside of the track, but the sight of the steep slope probably unnerved the driver and he gave a wrong turn of the steering wheel. Both rear wheels collapsed

seventeen competitors into line on the track at their proper distances and instruct them on the method of starting, a delay which did not please the public. As a signal to start the engines a rocket was fired, and three minutes later another rocket shot into the air to indicate the start of the race. In another handicap race three Mercedes machines were placed nearly a quarter of a mile away from the Napier on the scratch and the starter waved his flag in such a half-hearted manner that, although one of the cars shot away quickly, the scratch man had to be signaled by the starter to come along. As a first attempt, however, the handicapping arrangements were satisfactory.

All races were for distances not exceeding five miles, experience having shown that above this distance public interest wanes owing to the cars becoming widely spaced.

In a 2 1-2 mile race for cars of 26 horsepower, 2,000 pounds weight, H. E. Hall's Germain won by 100 yards over an Arrol

MOORE BRABAZON'S MINERVA AFTER IT HAD ROLLED FROM THE TOP OF HIGH BANKING TO INSIDE OF TRACK.

and the car began to roll down the steep bank. The mechanic was thrown free of the car, but the driver, unable to extricate himself, was rolled over and over with the machine until it came to a stop at the bottom of the bank on the inside of the track, with its wheels in the air. On one previous occasion a car went over the edge of the high banking, fortunately without any ill effects. The driver on that occasion steered it right off the cement to the outside earth banking, and allowed it to slide down until the outside railings brought it to a stop.

### Novel Features in Handicaps in Numbering.

Attendance was still rather meager, notwithstanding a reduction in price of admission and further improvements in holding the races and arranging for the comfort of spectators. Sport was excellent, the meeting from the automobilist's point of view being the best yet held on the track. Instead of racing colors, as used at previous meets, each car was equipped with one of the new number plates, consisting of a flat metal disc carried in brackets behind the driver. By this means it was possible to distinguish the cars at any part of the track, and there is absolutely no increased wind resistance by the use of the plate.

For the first time, too, handicapping was employed by spacing the cars at the start. Throughout the season data had been collected on the performance of the different cars, and this, together with the known horsepower, allowed a very fair handicap to be arranged. It required about half an hour to get the

Johnston, at an average of 53.5 miles an hour. There were nine starters, among them being a Cadillac and two Berliets.

The 2 1-8 mile race for 40-horsepower cars, weighing 2,500 pounds, resulted in a victory for H. C. Tryon on a Napier at an average of 68.25 miles an hour. Clifford-Earp on an Iris was second and Huntley Walker on Darracq third.

A splendid race was witnessed in the five-mile contest for 90-horsepower cars weighing 3,000 pounds, which united one 1907 and two 1906 Grand Prix Mercedes and one Darracq. The 1907 Mercedes was similar to those of the previous year, with the exception that it ran at 1,500 revolutions to 1,200 revolutions of the earlier models. Drabble's Mercedes was first, at a speed of 92.5 miles an hour; Hutton's Mercedes second, and Resta on the same make of machine, third. Warwick Wright, last on the Darracq, ran at more than 90 miles an hour. Hutton's Mercedes was hardly recognizable as a German machine by reason of an extemporized cone shaped water tank in front, which gave the vehicle the appearance of a projectile.

Newton, driving S. F. Edge's Napier, won the five-mile handicap sweepstakes at a speed of 63.25 miles an hour in a field of seventeen starters. Napier came second and Darracq third.

Napier won first and second in the 60-horsepower 3 1-4 mile race for machines weighing 2,700 pounds. It was in this event that Moore-Brabazon's Minerva was wrecked.

Mercedes got first and second position in the 3 1-4 miles handicap for high-powered cars weighing 2,700 pounds.

# The Motor Boat Champions of America

"XP DNC," LEADING "SKEDADDLE" IN THE THIRTY-MILE NATIONAL CUP EVENT IN THE THIRD DAY'S RACING.

**S**TORM and fog enshrouded the Hudson when the start was given on September 23 for the first race in connection with the annual race week carnival of the Motor Boat Club of America. The opening day's reliability trial united eight of the sixteen crafts originally entered, all of which, with one exception, succeeded in making the eight circuits of the course. Charles J. Swain's *Sparrow*, after making the fastest round, was forced to retire with its gasoline exhausted. *Speedway*, which covered nine rounds, was second fastest, and *Durno* third in point of speed. Position, however, was determined on a point system considering regularity of running, fuel and oil consumption, and similar attributes of an effective motor boat.

A stiff southeast wind was blowing up the river when *Skedaddle*, *Irene*, *Den* and *Dixie* united at the boathouse at the foot of 108th street on the second day for the 30-nautical-mile trials for the American championship. It was an unsatisfactory contest, for on the first round E. J. Schroeder's *Dixie*, victorious quite recently in the Harmsworth Cup Contest in England, was obliged to retire owing to engine trouble; *Den* went out on the second round and *Irene* on the third. H. H. Baruch's *Skedaddle*, much buffeted by the heavy seas and at one time in danger of being destroyed by fire, continued to the end, its time for the 30 nautical miles being 1:52:46. Fastest time was 24:40 miles an hour.

Joseph H. Hoadley's *Den* made the fastest time on the third day, when, in the first of the series of three races for the International Cup, she covered 30 nautical miles in 1:15:52. *Dixie*, the only other contestant in this event, disappointed her admirers by a retirement with carbureter troubles.

H. N. Baruch's *Skedaddle*, Jacob Siegel's *XP DNC*, and C. L. Seabury's *Speedway* started in the 30-nautical-mile race for the National Cup, held by *Skedaddle*. *XP DNC*, starting scratch, finished in 1:20:01, corrected time, *Skedaddle* being second, and *Speedway* third.

The Inter-State Cup, with its eleven starters, was the biggest event of the day.

C. J. Swain's *Sparrow* made the best time—1:40:53; *Meteor* was second; *Durno II*, third; *Speedway, Jr.*, fourth; *Artful* did not finish; *White Fox II* and *Flip* were disabled.

*Wanderlust* won the Motor Yacht Championship of twenty miles, with *Mao II* second, and *Marie* not finishing. *Ailsa Craig* secured an early victory over her only rival, *Iris*, in the Cabin Launch championship.

On the fourth day *Dixie* entirely disappeared from the motor boat carnival with a cracked cylinder, leaving *Irene* to run off the second match for the International Cup, her time for which was 1:15:07. *Skedaddle* got first place in the National Cup race, with *XP DNC* second and *Speedway* unable to finish. In the Inter-State Cup contest honor fell to *Sparrow*, with 1:32:53 for the 30 nautical miles.

*Dixie* being out of commission, *Irene* had no difficulty in capturing the International Cup Championship. Her time in the third match, run on the fifth day, was 1:15:56, against 1:19:47 for *Den*. The latter boat took the honors, however, in the mile championship flying start. *Den* and *Skedaddle* were the only contestants, the former averaging 25.622 knots an hour, equal to 29.504, and *Skedaddle* making 23.334 knots, or 26.1 miles. Six trials were run, three being with and three against the tide.

For the National Championship of 30 nautical miles, H. N. Baruch's *Skedaddle* and C. J. Siegel's *XP DNC* competed, the former finishing in 1:13:22 and the latter in 1:19:57. *Skedaddle* thus winning two out of three matches, secured possession of the trophy. *Sparrow* was fastest in the Inter-State championship, defeating *Artful* and *Oriole*.

*Den* and *Skedaddle* finished an excellent race on the sixth day in the 116.3-nautical-mile contest from 108th street to Poughkeepsie and back. *Den* covered the distance at an average of 22.77 knots an hour, *Skedaddle* coming home just 59 seconds behind her. When time allowance has been made for the difference in rating between the two crafts, the probabilities are that *Skedaddle*

"IRENE," WHICH WON THE INTERNATIONAL CUP CHAMPIONSHIP.

"SKEDADDLE," WHICH WON TWO OF THE THREE THIRTY-MILE HEATS FOR THE NATIONAL CUP AND THE RACE.

will take first place. Though four other boats were in the contest, they never at any time troubled the leaders. *Speedway* broke down going up stream, while *Durno II*, *Sparrow* and *Fairbanks II* remained a considerable distance in the rear.

Cruisers had their long race to Peekskill and back, a distance of 75 miles. The fourteen starters made a pretty spectacle as they started out from the clubhouse at 8:45 A.M. on a more promising morning than any of the previous ones. At Tarrytown *Marie* dropped out of the race with overheated bearings; *Bel-dame* gave up about the same point, and *Pirate* seems to have sneaked from the scene. When *Grayling*, the largest boat, reached Peekskill the club officials had not arrived to set the stake boat. After cruising round the spot where that craft should have been the *Grayling* headed for home, her elapsed time being 4:22:0. On corrected times the positions were: *Idler*, 3:36:50; *Prodigy*, 4:37:28; *Osprey II*, 4:11:34; *Speedway, Jr.*, 4:46:00.

During the running of the long race *Irene* made attempts on the measured mile and succeeded in breaking the American record for that distance. Three runs were made with and three

against the tide, the best runs being at the rate of 25.904 knots, equal to 29.828 miles an hour. The *Standard's* best performance last year was at the rate of 29.172 miles an hour, and the *Den's* best time on Friday, 29.504 miles an hour.

#### ANOTHER PROPOSED LONG ISLAND COURSE.

According to daily newspaper reports, a syndicate of New York, Philadelphia and Boston capitalists have secured 100 acres of land at Westbury, Long Island, and propose to construct an automobile race course thereon, solely for the purpose of racing and demonstrating cars. The tract is known as the Homestead farm and is said to be admirably adapted to the purpose.

#### NEW YORK REGISTRATIONS INCREASE.

Up to the evening of September 29, the registrations of automobiles at Albany had reached a total of 907 for that month, so that with the one day missing it is safe to say the increase will be more than 200 cars over September, 1906.

THE "DEN," WHICH WON THE MILE CHAMPIONSHIP FLYING START, AND LED IN THE RACE TO POUGHKEEPSIE AND BACK.

# THE CARBURETER AND ITS FUNCTIONS\*

By CHARLES E. DURYEA.

THE carbureter is the lungs of the engine, and large power, long service and efficient action depend upon this device. Many varieties have been offered, and the road to the patent office is busier to-day than ever with people who think they have carbureters superior to former designs. With a fixed gas no carbureter is necessary, but air and gas adjustably proportioned are permitted to mix on their way to the cylinder with good results. The earlier inventors generally attempted to provide the gas by drawing air in some manner through a tank containing gasoline, which permitted the air to absorb gasoline vapor and issue from the tank practically saturated with vapor. This over rich mixture was then diluted by the admission of air to form the proper mixture. In one form wicks of cotton, or even excelsior, served to distribute the vapor through the air. In another form the air was drawn down into the liquid and, bubbling up through it, became saturated. Other inventors seeking simplicity admitted the gasoline directly into the air passage, trusting that it would be sprayed or vaporized and mixed with the air before the end of the compression stroke. Still others provided a spray nozzle, past which the air is drawn with sufficient velocity to break the liquid into a spray. This form is now in almost general use to the exclusion of other forms. Each is usually called a carbureter, but properly the gas tanks only are entitled to this name, and the present form is more appropriately an atomizer, or, since its essential service is to mix liquid fuel and air to form what is universally called a "mixture," I prefer the short, simple, expressive word, *mixer*.

## Some Facts That Should Be Borne in Mind.

A number of facts concerning gasoline engines must be kept in mind when considering the mixing device if the engine is to give superior results:

First, the mixer must perform its function to the fullest possible extent and intimately mix the air and liquid. It is not enough that it should provide a proper mixture at high speed only, for, although this will cause the engine to show a high power, it will not give smooth running or great power at slow speeds. If the mixture is not intimately mixed, some parts are too poor to burn, others burn slowly because lean, while other parts are too fat to burn, or burn very slowly because overfat. The result is little power, a hot engine, much deposit of soot and an ill-smelling exhaust that is distinguishable at a distance.

Second, in order to have full power and give the best results the liquid fuel must be properly proportioned to the air. Too much or too little liquid produces slow-burning mixtures and undesirable results. Further, although during each cycle the engine may receive the proper amount of air and liquid for the perfect mixture, if the early portion is air and the latter portion largely liquid, it is quite evident that a homogenous mixture will not be produced and that proper ignition with perfect engine behavior cannot follow. It is therefore necessary that the air and liquid be proportioned constantly in a proper manner, and this may be rightly termed the second great requirement.

Third, it is also evident that different sized engines will have different requirements, and that a mixing device suited to one may not be suitable when fitted to another. The same is true in connection with speed. A proper mixture at one speed may be completely thrown out of proportion, or may be improperly mixed at another speed. Engines nowadays run at rotative speeds from 200 to 2,000, and the perfect mixer must meet these requirements. Since at high speeds full charges are usually used, while at the low speeds the throttle reduces the charge admitted, it is quite evident that the service required of a mixing device is

not adequately represented by the proportion 10 to 1, but that it is probably more nearly 20 to 1, and possibly may vary as much as 50 to 1. Such wide variation increases the difficulty of maintaining proper proportions and making a perfect mixture, and renders it necessary that the mixer should automatically adjust itself to the varying requirements.

## Where Past Carbureter Construction Was Faulty.

These three features are the basic ones which must be kept in mind while considering the minor but important points of the perfect mixer. Most mixing devices heretofore constructed have aimed to provide for these three points, but more often than not each provision has been an imperfect one and the results not of superior quality. The typical mixer of to-day takes air from the atmosphere at practically constant pressure, and liquid from a float chamber presumably having a constant level. Since, however, the quantity of air required is about fifteen hundred times greater in volume than of the liquid, and since the speed under a given suction is much greater than the speed of the liquid, it will be seen that wide opportunity for improper proportion exists. Add to this the facts that at very slow speeds the liquid may not be sprayed, but may be simply drawn from its nozzle in large drops, or even in a stream running down the outer walls of the nozzle, while at very high speeds the air inlet may be too small to admit a sufficient quantity of air, and the difficulty of maintaining a proper proportion under such wide variation will become apparent. To meet this difficulty the perfect mixer must automatically enlarge the supply of air and vary the liquid to maintain it proportionate to the air as the needs of the engine grow greater. To do this with certainty it should have a diaphragm acted upon by the suction of the engine, which diaphragm should be large enough to respond to slight variations, and thus prevent high vacuums, with consequent reduced power at high speeds. This method of providing for wide range is the only correct method. The mere opening of the usual auxiliary air port cannot perform this service, for the suction must increase considerably before the air port will open, and there is seldom or never provision made for securing either intimate mixture or proper admission of proportionate amounts of air and liquid with this auxiliary device.

This necessary automatic adjustment should not only be operated by the suction, but it should be sensitive enough to prevent much variation in vacuum between high and low speeds, and the mixer at high speeds should have openings large enough to admit the fullest possible charges, while at low speeds the opening should be so small as to secure sufficient air velocity to make a perfect mixture, that is, a fine spray of the liquid properly proportioned and intimately mixed, even when turning the engine over by hand. This can only be attained by permitting a large diaphragm to vary the size of the passage or passages under increased suction, and consequently proportionate to the speed.

## Perfect Balance of the Float Is Necessary.

The float chamber should be concentric with the liquid inlet, so that inclination in any direction will not cause more or less liquid to be admitted. The float should be surrounded by a substantially concentric volume of liquid that will support and balance the float, with the result that sudden vertical movements, such as jolts, are without effect. This arrangement is superior to floats balanced by weights, in addition to the column of liquid, for, owing to their different densities, the liquid and the weight may interfere in their duties and destroy the perfect balance sought for. The float should be a single piece preferably without working joints, and particularly without frictional contacts with levers, which may sooner or later wear through its thin metal

\*Paper read before the Society of Automobile Engineers, Buffalo, N. Y., July, 1907.

and cause it to leak. The float should be constant in weight and buoyancy, and is therefore preferably of metal, since few cork floats can be depended upon to remain impervious to gasoline and retain their buoyancy. The float point should be adjustable, so that the level of the liquid may be maintained at the most advantageous point to suit the vacuum necessary to make the proper spray, and also to overcome the effect of different heads of gasoline which may be used. It should be quite evident that the mixer, giving excellent satisfaction when attached to the bottom of a tank three or four inches deep, may fail when piped to a tank several feet deep in the bow of the boat, which in rough weather may rise several feet above the level of the mixer. The float point may be of such taper and size as to in some degree vary the gasoline level in action, giving a higher level and better mixture at slow speeds.

The float point should be easily ground so that it may be kept tight and in perfect working order. Further, the motion of the vehicle should tend to move the float point to some degree, even though slight, which movement serves to force away any particles of dirt that may lodge on the point during the passage of liquid. On this account it is best if the float and point are fixed one to the other so that the point partakes of the motion of the float and liquid in the chamber. The gasoline should enter the float chamber from a single direction, either up or down, so that no pockets exist in which water or dirt may gather. It is best to feed the chamber by gravity from a tank above the float chamber and with downwardly extending pipe, without pockets, leading into the chamber near the top, with float point upward, such point being attached directly to the float without levers, weights or other unnecessary parts. The float chamber should open at the bottom for automobile use. This facilitates removal of any water, ice or dirt, and removal of float itself, without opening the top and permitting dirt to fall in from above. The float and removable bottom can be replaced with a stream of gasoline flowing upon them, which will wash away particles of dirt, if any accidentally get on the parts while being replaced. With top opening, ice in the bottom of the chamber may not only support the float and prevent its falling to admit gasoline, but may also bind the float so firmly that it cannot be removed to permit removal of ice, which may prove an unpleasant predicament if away from means of warming the mixer. The float chamber should have an air vent to permit proper action, and this vent should preferably terminate above the gasoline tank, so that if for any reason the float fails in its duty the gasoline rising in the vent tube will not rise higher than the tank level, and so cannot escape. Where convenient, the tickler, or device for depressing the float and flooding the mixer, should pass down this vent tube. This arrangement, in connection with a needle that closes the nozzle when the motor is stopped, prevents danger from leaking gasoline and possibly fire. It is more reliable than a stopcock, for the operator will grow careless about the stopcock, but will, if needed, adjust the nozzle daily to secure best results under prevailing weather conditions for that day.

#### Equalization of Fuel Flow into the Mixer.

All gasoline entering the mixer should be strained through ample gauze, so that particles likely to clog the nozzle may be kept from entering. Such gauzes are usually provided at the opening of the tank or in the funnel; but this is not sufficiently certain for the best results and the perfect mixer should be self-protected from this certain cause of trouble.

The outlet from the float chamber, usually termed the nozzle, should be nearly concentric with the chamber. If centrally located, variations in angle do not affect the level at this point; but it is some advantage to have this point slightly behind the center, so that going up hill or accelerating the action of the vehicle automatically raises the level of the liquid and thus slightly increases the flow, making the mixture slightly more fat and powerful. This arrangement permits the normal mixture to be lean, insures perfect combustion, great economy, and no odor, yet

automatically brings the mixture to maximum fatness and power when power is needed.

Since liquid has considerable weight, and consequent inertia, the passage to the nozzle should be both short and large, for large passages do not clog easily and, if short, the liquid can flow quickly and will likewise cause flowing without delay when the suction ceases. If large, the friction is less and no particle of liquid need acquire high momentum. If, on the other hand, this passage is long, the liquid does not get started until a large volume of air has passed the nozzle, making the early part of the charge too lean, while, as the suction decreases and the air flow ceases, the inertia of the liquid causes it to continue to flow, making the latter portion of the charge overfat, and leaves between charges probably unsprayed drops of liquid, which fall upon the walls or are drawn into the motor.

#### Unsprayed Liquid Should Not Be Allowed to Waste.

Such liquid as remains in the passage unsprayed should be retained, and not permitted to run into the motor or upon the ground. This liquid should also, by the shape of the passage or by other suitable means provided, be broken up, sprayed or finally divided at the next suction stroke, so that it may properly serve its purpose within the engine. If, because of a faulty float, the nozzle should flood, the air passage should not fill with gasoline, for, when attempting to start the engine, this would result in a large volume of liquid being drawn into the cylinder, making its contents too fat to ignite. To prevent such flooding, the air passage should have an opening at a proper distance above the bottom to permit the escape of excess liquid, in case such exists.

The nozzle should be closed from above by an adjustable needle, for the inverted conical point of such a needle assists in making a fine spray. This needle-adjusting handle should terminate near the operator and permit him, while operating the vehicle, to vary the proportion of the mixture, and thus secure the greatest power by trial, as well as accommodate the device to the temperature and humidity of different days, and also to the gravity and composition of different fuels. No adjustment while the vehicle is standing can compare with adjustments in actual road service in point of accuracy. Further, the mixer should be adjustable at low speeds, to secure certain ignition and steady running. Gas engines are particularly prone to misfire at their limits, and the perfect mixing device for automobiles will provide superior conditions at these limits in order to secure the most satisfactory range of service. This necessitates provision also for adjustment at normal or high speeds, and by inference the device should automatically compensate at intermediate speeds. Most present-day devices are adjustable for one speed only, and depend for automatic adjustment upon considerable variation in the suction vacuum, and so cannot give good results at widely varied speeds from that to which they are adjusted. This defect need not, and most certainly should not, exist.

That the largest possible charges may be drawn into the motor at high speeds, it is self-evident no needless friction should be caused the air as it passes toward the engine. On this account a single air passage is better than several, because there is less wall surface and friction. It is also evident that the air passage should be easy, and not tortuous or broken. It is undoubtedly true that the tortuous passage will break up the particles of gasoline and help to form a homogeneous mixture, but this is done at the cost of increased suction and of some loss of volume and consequent needless loss of power from the motor, particularly at high speed.

#### Protective Gauzes and Their Frequent Cleansing.

Since some engines may occasionally backfire through their inlet valves, the mixer should be provided with escape for explosion, for if this is not done the pressure may force into the float chamber and will more certainly interfere with the next succeeding charges than if allowed to escape into the atmosphere freely and promptly. To prevent such explosions from igniting anything on the outside, the pipe entrance should be provided with a gauze

strainer, which mainly serves to keep out particles of dirt that otherwise would enter the engine and likely stick to the walls and cause rapid wear and pre-ignition. Much of the carbon deposit so common in automobile engines is caused by road dust, with enough oil to bind it together.

The rapid evaporation of the liquid not only takes heat from the passages in which the evaporation takes place, but frequently causes a deposit of moisture, which in the presence of low atmospheric temperature becomes ice and clogs the passage. This freezing may be prevented and a more perfect evaporation, with consequent intimate mixture, secured by heating the passage where the mixture is taking place. I therefore favor a heater jack outside the mixture passage, through which hot gas from the exhaust or hot water from the circulating system may flow, and I consider it advisable to place within the mixture passage at this point one or more gauzes of large area to positively intercept large particles of liquid and prevent their being carried into the cylinder. All gauzes should be removable for cleaning purposes, and frequent attention to the various details of this most necessary part of the vehicle is necessary to insure perfect work.

#### Present-day Faults of the Mixing Valve Summed Up.

We may get a better understanding of the features necessary in a perfect mixer by considering a typical present-day carbureter. This consists of a float chamber, usually at one side of the air passage and with a long, small nozzle for gasoline reaching into the air passage, which at this point is strangled or contracted to increase the velocity of the air past the nozzle. Between the nozzle and the engine an auxiliary opening is provided, closed by a spring valve, which, when the suction is increased sufficiently, opens more or less, admitting a quantity of pure air with which to dilute the overrich mixture coming from the strangled passage. The action of this device is about as follows: At extremely slow engine speeds, say under 200, the mixture is imperfect because the air passage is not small enough to give proper air velocity for a suitable spray. This is one of the reasons why the gas engine is regarded as inflexible, and why many engines fail to develop power as soon as their speeds are reduced. If this passage is small enough for perfect running at very slow engine speeds, say 50 and 100 with throttle practically closed, it is too small to admit a practical amount of air at higher speeds, so the gasoline by itself, or badly mixed with air, is drawn from this passage, while the greater portion of air, with imperfect provision for mixing, enters at the auxiliary valve. Clearly this cannot give a proper mixture or proper proportion. Next it must be remembered that, while the strangled passage is constantly open, the auxiliary passage is closed except when sucked open. Further, the auxiliary valve flutters, and the result may often be that in the early part of a stroke the mixture is exceedingly rich, because it all comes from the strangled passage, while later, the auxiliary having been sucked open, a large quantity of air enters (larger than necessary), with resultant poor mixture, followed by closing of the valve as the suction decreases near the end of the stroke, with consequent rich mixture at this time. Add to this the fact that with a long, slim nozzle the gasoline will continue to flow for some time after the suction stops, because of its momentum, and it will be seen that the beginning and end of each charge are probably overfat, while the center of the charge is very lean.

#### Wide Range of Suction One of the Difficult Problems.

There is also a wide range of suction, because at the beginning and end of the stroke there is little or no vacuum and the strangled tube offers a free passage, while at the center of the stroke there must be, and is, enough vacuum to open the auxiliary; so it is quite evident that the engine is not drawing uniformly and is not free from that negative pressure or vacuum necessary to get the largest charges and to avoid needless loss of power. The ideal carbureter will avoid this irregularity by opening a passage proportionate to the amount of mixture required, and it will not only open the air passage, but it will adjust the gasoline to suit. If, for

example, a piston or diaphragm is provided, operated by the suction of the engine in one direction and by gravity in the other, with a dash pot so that it cannot flutter, it may be made to open the air passage and to adjust the gasoline so that with little or no increase of suction the proper amount of air and liquid is admitted. With such arrangement the vacuum need only be sufficient to give the air the necessary velocity required to make a proper spray, and higher speeds will not starve the engine because of higher vacuum. The dash pot insures average openings, so that at the beginning and end of the stroke the velocity will be low, at the middle high, but with an average somewhat higher than the least practical velocity, while good results will be obtained even during the slow portions of the stroke.

#### Ideal Carbureter Should Have Fully Four Adjustments.

Many typical carbureters have quite abrupt corners. This decreases the amount of air that can enter, and thus impairs the efficiency. Some provide for complete vaporization within the carbureter, or very close thereto, with the result that in wet weather the moisture of the atmosphere is condensed, and in cold weather frozen, thus choking the device with ice. It is better practice to carry the spray some distance and thus distribute this refrigerating effect, with less likelihood of ice formation.

The typical carbureter has but a single adjustment for the gasoline. It is argued that the gasoline may be adjusted for low speeds when the auxiliary air valve is shut, but this very frequently does not give the proper quantity of gasoline for high speeds, so it usually becomes necessary to adjust by gases, and after a trial adjust again, until that adjustment which gives fairly good results at high speeds and permits getting along at low speeds is found. That this is not ideal is readily seen. The ideal method would vary the air passage so as to supply the requisite amount of air with the least possible variation in vacuum, and would also vary the amount of gasoline to suit this amount of air. The ideal mixer should be adjustable at low speeds for starting or running the engine idle, and it should also be adjustable at maximum or normal speeds, so that the best possible condition can be had at this time. It should automatically vary this normal or running gasoline adjustment as the proportion of air is varied. In short, it should not have less than four adjustments, two of which (*i.e.*, gasoline and air) are automatic, and two of which are manually operated, as indicated by the behavior of the motor. The typical mixer has but half this number, and these badly deranged. The writer patented, more than a half-dozen years ago, the first automatic air inlet applied to automobile carbureters, but because of the defects of this method did not use it to any great extent, although by careful adjustment of the auxiliary valve springs it may be made to serve better than most carbureters will serve without this auxiliary valve.

#### Some Conclusions Regarding the Perfect Mixer.

In conclusion, the requirements of the perfect mixer may be summed up as follows: It must intimately mix, properly proportion and satisfactorily adjust, and also have the following specifications: Float chamber concentric with inlet and nearly concentric with outlet; float of metal with point adjustable to different heads, different liquids and different weights of float; float point easily ground, and moved by any motion of the float; the float should be free from balance-weights or levers; the mixer should be adjustable by the operator while driving; it should have adjustments for very low speeds and also for normal or high speeds, and should automatically adjust between these speeds; it should have a short gasoline passage for quick action, and a large gasoline passage to prevent clogging or ramming; it should retain in the air passage unsprayed liquid, but have provision to let out any excess. A gauze strainer at the gasoline inlet and also at the air inlet are strongly advised. The gasoline should flow in a single direction, either up or down, to the float chamber from the tank. The float chamber must have vent at the top, which should, if possible, open higher than the tank; it should have re-

movable bottom and a means for daily use to shut off the gasoline. The air passage should be easy and single, rather than multiple, and have a removable gauze to prevent unsprayed liquid reaching the engine. This passage should be adjustable to the engine speed by the amount of suction, and should open freely in a reverse direction to permit back explosion to escape. A dash pot must prevent fluttering with change of opening, so that the suction vacuum is closely constant. Provision for heating is necessary in cold weather or with low gravity liquids. A mixing device which meets these requirements leaves little room for improvement.

#### Characteristics of the Duryea Carbureter.

The Duryea mixer has been designed after a very long experience with stationary, automobile and marine engines of all varieties. As shown in the sectional sketch herewith, it has an air passage nearly horizontal, curved easily, and provided at its for-

CROSS-SECTION VIEW OF THE DURYEYA CARBURETER.

ward end with gauze screen to exclude dirt. At the opposite end a disk or other throttle is provided, while midway is located the gasoline inlet, with adjusting needle and an adjustable air gate, spring mounted, so that it may open freely to let out any explosions or back pressure from the engine, but which ordinarily remains closed and causes the major portion of the air to pass under its lower end and intimately mix with the gasoline. The air passage is of necessity rectangular at the portion where the air gate is placed. This air gate is carried by a diaphragm and regulated by the suction of the engine, which withdraws the air from above the diaphragm, raising it and the gate support. This diaphragm is large, so a very slight variation in the amount of suction suffices to change the area of the air inlet. The gasoline passage is extremely short, with level adjustable by the float needle, so that the gasoline can be drawn with very slight suction, which also contributes to full charges and large power. The float and its conical point act as one piece without pivots, levers or weights, but capable of a slight twisting motion, which twisting permits the point to grind itself upon its seat and thus remain tight and clean. The gasoline inlet is protected by a gauze cone, which catches any dirt from the pipes or tank, and which is removed readily for cleaning. The float chamber is closed at the bottom by a cap, screw-threaded, and with a lead gasket, making it absolutely tight. The float needle is adjustable without removing the float or this main cap, by unscrewing a smaller cap and reaching the needle stem with a small screwdriver, the slight leak of gasoline doing no harm. The gasoline-adjusting needle is adjusted by a differential screw on top of the mixer, which may be provided

with a stem carried to a point on the dash or elsewhere accessible by the operator while driving the vehicle. This enables the mixer to be adjusted at any time in order to secure the best results. Ordinarily the screw is set to secure easy starting and certain running at very low speeds. The needle is spirally flattened, forming a sort of screw which passes through a long slot in a radius bar, pivoted at one end to an adjustable nut in the cover and at the other end sliding in a radial slot in the diaphragm.

This arrangement causes the needle to be partly revolved as the diaphragm rises or falls, thus varying its adjustment; and the amount of this adjustment may be greater or less, as the radius bar is, by its nut and screw, caused to be farther from or nearer to the needle. This radius bar is adjusted for nominal or high speeds, as may be desired, and the adjustment is found by trial, either by adjusting the differential screw to produce the desired result, and then changing the radius-bar screw accordingly, or by adjusting the radius-bar nut and screw while the differential remains in a fixed position. This arrangement provides for this mixer superior adjusting facilities not found in others, in that the mixer may be perfectly adjusted for low speeds and for high speeds by the two separate adjusting devices, and, because of the diaphragm, radius bar and twist of the needle, it will automatically adjust itself in a reasonably proportionate manner for intermediate speeds. Since it depends upon suction for this automatic adjustment, it secures the same quality of mixture, regardless of the action of the throttle or the size of the engine, and is therefore more nearly universal than previous devices. It has no working parts exposed to mud, and may, therefore, be placed in any desired position. Its gasoline outlet is slightly to the rear of the center of the float chamber, which slightly increases the gasoline flow when great power is needed, as on hills.

This device may be used without a heating chamber if it is supplied with warm air, or if the quality of fuel is such that heat is not needed; but a heating chamber can be furnished which is attached immediately after the throttle, where the evaporation is greatest and heat most needed, and this chamber is arranged for either water or hot gas, as may be preferred.

Not many power tests have been made of this device, but such as have been made indicate 5 to 10 per cent. more power than other carbureters gave on the same motor.

#### FIRST FALL MEETING OF A. S. M. E.

The American Society of Mechanical Engineers will hold its first fall meeting on Tuesday evening, October 8, in the main auditorium of the Engineering Societies' Building, 29 West Thirty-ninth street, New York City. The subject of the meeting is Industrial Education, and both college technical courses and student apprenticeship courses will be discussed at length by men who have been in charge of theoretical and practical institutions. Professor John Price Jackson will read a paper on "College Technical Courses and Apprenticeship Courses Offered by Manufacturing Establishments," and Dr. Henry S. Pritchett, president of the Carnegie Foundation, as well as of the Society for the Promotion of Industrial Education, and Professor Dugald C. Jackson, of the Massachusetts Institute of Technology, will deliver short addresses, while a number of manufacturers have been invited to speak informally.

#### A GENERAL REVIEW OF CARBURETION.

Under the title of *Automobil-Vergaser*, there has just been issued from the press of M. Krayn, Berlin, W. 57, Germany, what is probably not alone the first, but likewise the most complete, special study that has been devoted to the subject of the carbureter and its functions. It consists of a volume of 138 pages illustrated with no less than 130 sketches, showing the principles of the majority of standard European carbureters as well as a number of drawings illustrating the theories of carburetion.

# LETTERS INTERESTING AND INSTRUCTIVE

## ANSWERED MORE BRIEFLY THAN CORRECTLY.

Editor THE AUTOMOBILE:

[919.]—In reply to a letter, No. 906, printed in "The Automobile" of September 19, in which the inquirer asks for information as to the overheating of the gearcase of his car, and states that he also finds it difficult to keep the grease in it, I think it is most likely caused by the fact that he puts too much grease in the case, which would cause it to both leak and overheat. In all probability the engine overheats through the slipping of the clutch. All beginners, as a rule, cover their cars with grease and oil, thinking they will profit by it, but the result is quite the contrary.

The letters are interesting, but would be more instructive if they were answered *more correctly* than briefly. I hope you will not find this criticism indiscreet, as I think it a benefit to both the editor and the reader.

H. LECONTE.

New York City.

We are always glad to have any of our readers criticize the answers given in this department, or, in fact, any other part of THE AUTOMOBILE, and for this reason we have emphasized that portion of your letter preferring accuracy to brevity by putting it in italics. If we were not brief it would be impossible to answer the number of letters received within a reasonable length of time, and a question long unanswered loses its interest. But to our knowledge we have never intentionally sacrificed the correctness of an answer for the purpose of making it short, and at times have been at pains to devote a column or more to the answering of a question, even though its length necessarily meant the omission of other inquiries until later issues.

In looking over the letter you refer to, it does not strike us that the answer thereto is unusually brief, and, so far as we can see, it covers most of the commoner causes giving rise to the complaint in question, particularly in view of the fact that the inquirer supplied so little detailed information. However, whenever you come across an inquiry in our columns which, from your experience, you feel better able to answer correctly than has been done, we will always be glad to publish your letters.

## AN OPPORTUNITY WANTED FOR STUDY.

Editor THE AUTOMOBILE:

[920.]—Not being able to obtain what I want by watching advertisements and otherwise, I am coming to you with my troubles:

I wish to make a thorough study of the ignition and fuel questions as applied to the automobile. It is not practicable for me to attend a college, so I must get it from text-books or some other way. I have studied some of the primary books, such as Homan's "Self-Propelled Vehicles" and "Elementary Electricity," by Swoope. If you help me in any way by suggestions I shall feel much indebted to "The Automobile," from which I have received many profitable lessons.

EDWARD E. DEAN.

New York City.

Apart from obtaining an outline of the theory of the subjects in question, it is unfortunate for your purpose that little or no further help is to be obtained by the aid of textbooks. The matters in question are not yet sufficiently well established to have made this possible. Considerable of value appears from time to time in the technical press, but even this can be of no great help unless supplemented by practical experience. Make the acquaintance of some chauffeur, or try to obtain permission to spend your leisure time watching the repair men in a garage or shop. Under such circumstances, observation alone will be a great aid, and doubtless the workmen will be willing to help you by answering questions as well as by volunteering information, though as a rule one must depend mainly on his own senses in such a situation. Theoretical knowledge is, of course, a necessity, but when carried to an extreme becomes a detriment rather than an advantage. Having obtained a good groundwork in the rudiments you will be able to apply this only by observation and practice.

## HOW TO WIRE DRY BATTERIES FOR IGNITION.

Editor THE AUTOMOBILE:

[921.]—As a subscriber to "The Automobile," I would like to ask the proper way to wire up dry cells for a four-cylinder engine using jump spark, to give the longest possible service. I enclose three rough sketches of wiring diagrams of different kinds and would like to know which is the best.

LOWELL ELLIS.

Warren, Mass.

Sketch number 3, showing two sets of six cells each, wired so that either set may be used at will, is the best of the diagrams

FIG. 2.—Plan of wiring showing four cells in service.

submitted, particularly when it is modified by the addition of a third point on the coil box switch, permitting both sets to be used in series-multiple, as indicated by the dotted line amendment we have made to your sketch. This would permit the use of either set of cells singly, or, after they had been run down somewhat, of the use of both together merely by moving the

FIG. 3.—Plan of wiring showing six cells in service.

switch. We do not think it advisable to employ less than six dry cells. Your sketches, numbers 1 and 3, are practically the same, so we have omitted the former; number 2 has the disadvantage of having but four cells in series, thus reducing the voltage at the expense of the current and thereby greatly shortening the life of the battery, nor does it provide any reserve.

## HERE'S A MIGHTY HARD NUT TO CRACK.

Editor THE AUTOMOBILE:

[922.]—As I am a subscriber to your very interesting journal and very much interested in automobiles, I wish to ask you to print in your next issue the answers to the following questions. I am about to get out a patent on a transmission, which I term "the sliding key transmission," and also a friction transmission which I

consider superior to any they have got on the market. Now, do you suppose that one or the other or the two will be a success as to advantages and efficiency, and whether they will find a ready market for them or not? Also a patent system of reducing the charge of an internal combustion engine, consequently reducing the consumption of gasoline. Do you think this would be of any advantage? And again, do you suppose there is still a good market for a good air-cooled engine? I would deem it a great favor to see the answers in your next issue.

N. J. G.

Grand Rapids, Mich.

Frankly, you have given us a conundrum in your first query. With absolutely no information as to the details of the mechanism in question, you might just as well have closed your fist and asked us to guess whether you had a button or a gold dollar in it. Many of the most promising inventions fail utterly to materialize the hopes of their inventors, and likewise some apparently worthless ones turn out to be immensely valuable. Yours may be in either the button or the gold dollar class; we do not know, and our guessing would not benefit you, as the man who buys such a thing wants "to be shown."

Anything that tends to make the internal-combustion motor more efficient and more economical should have a good market value. The same is true of the demand for a good air-cooled motor. To put it in the vernacular, it depends entirely upon whether you are able to "deliver the goods" or not. Neither we, nor many who are in an even better position to judge of such things, could tell you to an absolute certainty at the outset whether your invention would be highly successful or not.

#### DIMENSIONS OF PROSPECTIVE SIX-CYLINDER.

Editor THE AUTOMOBILE:

[923.]—I have been working on the plans for a six-cylinder engine for my own use, and would like to have you make any criticism or suggestions you see fit regarding its dimensions or design. It is intended for a two-passenger runabout capable of making a little speed and still serve for cross-country use. A two or three-speed transmission is to be employed with double chain drive.

The cylinders are to be water-cooled, and have 5-16 inch walls, with a 1-inch jacket space around the valves, which are oppositely disposed, the jacket extending 1 inch below the piston when the latter is at its lowest point. The cylinder and head are in one casting, and the water-jacket wall is 3-16 inch. The bore is 6 1-4 inches, and the stroke 6 inches. The valves are 2 1-2 inches, with a 2 1-4-inch opening; both to be mechanically operated. What should be the proper lift?

The crankshaft has a bearing between each pair of cylinders, the crank pins being 3 1-4 inches long by 2 1-2 inches in diameter, with a 1 3-8-inch cheek, 2 3-4 inches wide, between them. Is this cheek heavy enough? The end bearings are 2 1-2 by 6 inches. The piston pin is 1 1-4 inches in diameter, with a 3-4-inch hole through it. The connecting rod is 12 inches long, with brass bearings measuring 1 1-4 by 3 inches at the piston end. What should the flywheel dimensions be? What speed should the motor have for ordinary use? What would be its speed limit, and how much power would it develop? What size wheels should be used, and what gear reduction employed with a three-speed transmission?

What should the compression be, and would a long stroke be more advisable or not? What speed should an outfit of this sort give in good working order on a good track? Will you kindly tell the engine dimensions and gear reduction, also size of the wheels of the Peerless "Green Dragon"?

A. L. CHAMBERLAIN.

Ames, Ia.

Answering your first question, according to the theory of valve design the inlet should be 1-4 the cylinder diameter and the exhaust 1-3, the theoretical lift for full opening being 1-4 of the valve diameter. According to this standard your dimensions are quite correct; but this has not been followed in recent practise, and you will find many motors of smaller size have 2 1-4 and 2 1-2 inch valves. They could be made slightly larger, reducing the lift correspondingly, thus making a much quieter and smoother running motor; 1-2 inch would be plenty of lift. We think the dimensions of the cheek quite sufficient, provided the crankshaft be made of good material, such as alloy steel. Designers vary considerably on the subject of flywheel dimensions, but we think you will find

a 14-inch wheel, with a 4-inch face and weighing about 85 pounds, most of which is placed in the rim, to be quite satisfactory. The permissible flywheel dimensions must naturally be governed by the other features of your design, such as clearance, material to be employed and the like, the above being for cast iron.

A normal speed of 800 to 900 r. p. m would be about right for a motor of the dimensions you name, and it could probably be speeded up to 1,300 r. p. m. with good effect. According to the recently adopted A. L. A. M. formula, its horsepower would be 98.5, and when speeded up to the limit this would be increased to about 110-115 horsepower. This is based on a compression of 60 to 65 pounds to the square inch. The power could be considerably increased by raising this factor, but in such a case the car would hardly be fit for anything but racing pure and simple. Thirty-six-inch wheels should be employed, and a suitable gear reduction for use with a three-speed transmission would be 1 1-2 to 1. A longer stroke would be more advisable on the score of efficiency, but not for such a car as you contemplate; the weight rises very rapidly with a slight increase in the length of the stroke, without advantages sufficient to compensate for it. Track speed is very largely a factor of recklessness in taking turns, but such a car should do 75 miles an hour without any trouble, and more on a straightway. We do not know the dimensions of the Peerless "Green Dragon" car, but doubtless either the makers will supply them upon request, or some reader who is familiar with the car will do so through this department.

#### HOW TO PROPERLY TIME VALVES.

Editor THE AUTOMOBILE:

[924.]—Can you give me, through "The Automobile," the proper way to time the valves of a two-cylinder, four-cycle motor, and a four-cylinder, four-cycle motor? The latter has mechanically-operated inlet valves, while the two-cylinder motor has automatic inlet valves; both run at about 1,200 r. p. m., and accelerate to about 1,500 r. p. m.

C. W. BYE.

New York City.

Where the two-cylinder motor is concerned, it is only necessary to time the exhaust valves. Before starting, look the motor over carefully and see if there are no timing marks on the face or side of the rim of the flywheel, usually the former. These are made to coincide with a guide mark on the frame or cylinder of the engine, just back of the flywheel. Failing these marks, remove the oilpan or bottom of the crankcase, so that the position of the cranks can be seen. This will serve as an index to the position of the pistons in the cylinder. As the motor's normal speed is high, the exhaust valve should be given considerable lead, and it should begin to open at a point corresponding to 10 to 15 per cent. of the length of the stroke from the bottom of the piston's travel, and thus bring its complete opening about when the piston is within 5 to 8 per cent. of finishing its downward stroke. Turn the motor over until the position of the crank shows the piston to have arrived at the point indicated, and set the camshaft so that the valve will be fully open. The contour of the cam will, of course, provide for its proper closing, which must be fully completed by the time the piston reaches the upward limit of its travel, so as not to delay the opening of the automatic inlet valve. As the cams are either integral or are pinned fast to the camshaft, timing one cylinder will suffice for both. After having completed the operation and adjusted the springs of the inlet valves, turn the motor over by hand a number of times to note the action of the valves before attempting to start it under its own power.

The operation is much the same in the case of the four-cylinder motor with mechanically operated valves. The exhaust should open and close at the points already indicated, and this valve of the first cylinder may be selected as a

guide for timing all the exhausts in case they are actuated from an independent shaft, and the inlet valve of the first cylinder for all the inlets. If both are on the same shaft either may be taken, for, as already mentioned, the cams are all fixed in place, and if one be properly set the others will be correct. The inlet valve should begin to open some distance before the completion of the exhaust stroke, as it is necessary to give it a lead also in a high-speed engine. It should be fully open either at the exact moment of the closing of the exhaust valve or slightly in advance of it, and it should remain open after the completion of the suction stroke for a period equivalent to 10 to 12 per cent. of the compression stroke. If properly designed and the position of none of the cams has been disturbed, all this is taken care of by their contour and their setting on the camshaft, so that it is only necessary to time either the opening or closing of one valve properly, and the rest must naturally follow.

### CARE OF PNEUMATIC TIRES DURING WINTER.

Editor THE AUTOMOBILE:

[925.]—As subscribers to "The Automobile," we would like to obtain some information regarding the care of pneumatic tires throughout the year.

Would you advise removing the tires from the car during the winter and hanging them up in a cellar or similar place, where there is some dampness?

Rosewood, O.

WEIMER & SON.

Dampness is not essential to the preservation of rubber, but rather a detriment, and most rubber manufacturers caution users to store tires in a cool, dry place, which, however, should also be dark, as sunlight is injurious to rubber. If the car be stored in such a situation it will only be necessary to jack it up so that the weight is removed from the tires, although we consider it really an advantage to remove the tires where the car is to be laid up for any length of time. Before storing it might be an advantage to have the tires put in good repair, in case there is any necessity for it, such as cuts and holes in the tread, as this not only puts the tires in condition to be used instantly whenever wanted, but also conduces to their preservation. The maker of the tires will doubtless furnish any detailed information you desire on the subject, on application direct or to the nearest agency.

### AS TO THE THERMO-SYPHON COOLING SYSTEM.

Editor THE AUTOMOBILE:

[926.]—Will you kindly answer the following questions through "Letters Interesting and Instructive?"

1. What is the thermo-syphon system of water circulation?
2. Would it be advisable to use it with a four-cylinder, two-cycle engine having no fan back of the radiator, but having a fan in the flywheel?
3. Can the ordinary type of radiator be used with the thermo-syphon system?

New York City.

MORTON E. MYERS.

The thermo-syphon system of water circulation depends upon gravity for its action. As water is heated it becomes lighter, and if it be under pressure this warm water will be displaced by the colder water back of it, which in turn, becoming warmer than the water behind, will also be displaced, thus setting up a constant circulation. This is the principle upon which the ordinary domestic hot-water system, or kitchen boiler, operates. The cold water apparently enters at the top—the same place as the hot water escapes, but actually it is led to a point near the bottom of the boiler, by a pipe on the inside of the latter, before being discharged. An outlet at the lowest point of the boiler connects it with the waterback placed in contact with the fire in the kitchen range, and the return pipe from the latter re-enters the boiler at a point about two feet from the bottom, and almost that distance above the cold-water inlet inside the boiler, so that the two streams never meet.

2. This system is very successfully used on some well-known makes of car, both foreign and American, and there

is no reason why it cannot be applied to the car you mention. The lack of a fan behind the radiator is no drawback, as the Renault—probably the chief advocate of this method of cooling—not only dispenses with a radiator fan, but has a radiator located back of the motor in an apparently very much enclosed position. Considerably more water is required than with systems using forced circulation, and this is the chief objection urged against the thermo-syphon.

3. The ordinary radiator can be employed with such a system, but it should be designed of sufficient capacity to accommodate the greater amount of water necessary. Care must also be taken to provide circulating pipes of larger diameter than where a pump is employed, and the circulation must be facilitated by using bends of large radius and avoiding sharp turns.

### MORE ABOUT TYPES OF RADIATORS.

Editor THE AUTOMOBILE:

[927.]—We notice your reply to No. 913 in "Letters Interesting and Instructive," September 26 issue of "The Automobile," and would be pleased if you would send us the address of the writer.

We think you were fair in your reply, but would say to you that a whole lot of the radiating proposition is guesswork. As a matter of fact, we have made up several special coolers of our Rome vertical spiral tubes to take the place of expensive honeycomb radiators on high-priced foreign cars. We have merely taken out the honeycomb core and inserted our cooler in the foreign-made frames, with nothing added in the way of external dimensions, and have succeeded admirably where the original cooler failed. How would you account for that? The next auto show will have a good many recruits in the vertical tube ranks, and you, as news dispenser, should give this condition of affairs as generous attention as you have given our competitors in the past, who now make their entire effort on the cellular and honeycomb type of radiators.

LONG-TURNEY MFG. CO.,

Rome, N. Y.

Geo. M. Turney.

The mere fact that a car is of foreign origin, or high-priced, is not conclusive evidence that every one of its components represents the highest degree of efficiency or the best method of manufacture, as both foreign and high-priced designers, the latter on either side of the Atlantic, have made numerous mistakes. Doubtless your success is due to the fact that you avoided the original designer's errors in addition to increasing the efficiency in other ways.

### A MANUFACTURER'S PERTINENT SUGGESTION.

Editor THE AUTOMOBILE:

[928.]—If I may be permitted an editorial suggestion, I would call your attention to the enclosed clipping, being a report of the address of Melville E. Ingalls to the American Banking Association at Atlantic City, N. J. This gentleman, while stating what is undoubtedly a fact, is "following the leader" in blaming the automobile for all the bad things that he thinks are happening. There have been several such comments made recently, and it is about time for an automobile journal to call a halt on the extravagant statements which would put the brunt of any possible bad times on the automobile.

Mr. Ingalls says that in the last one or two years \$400,000,000 has been spent on the automobile. There has never been a year in which the value of automobiles built in this country has been over \$50,000,000, if, in fact, as great as that. It is inconceivable that \$350,000,000 have been spent on up-keep and incidentals, that would not have been spent did the automobile not exist. Mr. Ingalls is talking through his bonnet if he is correctly quoted.

On the contrary, the automobile, after the first blush of extravagance which is now about over, will prove to be one of the greatest possible commercial advantages, just as the steamboat, the railroad, the trolley or any other means of saving time and annihilating distance has proved to be a benefit.

I would suggest that Mr. Ingalls and the other gentlemen who are fond of saying bad things about the automobile, would also figure how much money is spent annually on gin rickies, for example, on diamonds, on "more than enough to eat," "more than enough to wear," or any one of the thousand other national extravagances.

Detroit, Mich.

FRANK BRISCOE.

EDITOR'S NOTE.—As the only reference to the automobile in the clipping in question was its inclusion in the category of national extravagances and the citing of the figures mentioned, it is not reproduced here.

CHAS. J. GLIDDEN SAMPLING BROOKLANDS SPEED COURSE.

### TOURIST GLIDDEN TRIES SPEEDING.

LONDON, Sept. 16.—After adventures in the heavens with intrepid French aeronauts, Globe-Girdler Glidden has descended on London's "suburban" autodrome to taste the joys of a "79" clip. There are no water breakers, no restrictions, there is safety up to ninety miles an hour, but the American world-girdler will not admit that it can equal touring. Without waiting for a brush with Edge or Lancia, Charles J. Glidden got aboard his trusty Napier and jogged off a Land's End John O'Groats trip.

Mr. Glidden arrived in New York on September 24, via the *Kaiser Wilhelm II.*, for a winter's rest at his home in Boston. His total mileage to date is 42,367 miles.

### MORE SAMPLES OF AMERICAN ROADS.

Indiana is proud of its gravel roads and of the mileage of them which she is constantly increasing, but there are parts of the State, particularly in the south, where they pass over land only recently reclaimed from swamps, and as these are not built roads it only requires a comparatively small amount of rain to convert them into morasses. How true this is may be judged by the photograph, showing a Premier "24" roadster. The car is owned by a prominent Indianapolis contractor and has seen several thousand miles of service over similar roads, during which time its bill for repairs is said to have amounted to \$15. The portion of the road shown in the illustration leads to a town where the car's owner has buildings in course of construction and the car has been over it daily for almost a year past. Frequently the plastic clay and sand is right up to the hubs.

PREMIER SUCCESSFULLY NEGOTIATING HUB-DEEP INDIANA MUD.

### TOURING CAR AND CAB SERVICE FOR GOTHAM.

New York is promised a modern automobile service by the Touring Car and Taxi-Cab Service Company, a concern just incorporated with a capital of \$1,000,000. Dr. Louis H. Mathez, vice-president of the company, states that arrangements have been made to obtain a large number of high-class autos for public service at prices which shall put the vehicles within reach of the general public. Sixty touring cars will be in operation by the first of the year, and by the end of next year there will also be in operation 125 Renault taximeter cabs of 10 horsepower. Later 250 more of these small vehicles will be put in operation.

Thomas Reed, Jr., is president of the company, Dr. Louis H. Mathez, vice-president, and R. H. Gordon, Jr., secretary and treasurer. The board of directors consists of the above officers and Dr. Preston Satterwhite, W. T. Patterson and D. Nevius.

### A PHOTOGRAPHER'S USE OF THE AUTO.

"It probably costs me \$50 a month, I admit," says Royal T. Gillett, one of the Grand Rapids, Mich., hustlers in the photograph business, "but if I didn't use that Maxwell in my business I would have to hire two additional men in order to get all of my outside work done. I am able now, by having the auto, to do it all myself. So I get what is the equal of the services of two

HOW A MICHIGAN PHOTOGRAPHER FINDS THE MAXWELL HANDY.

men for \$50 a month. By its use I fill three and four appointments every afternoon, sometimes miles apart, where I could only do one under ordinary circumstances."

### NEW BOOKS FOR AUTOMOBILISTS.

**A Four-language Dictionary.**—Automobilists traveling abroad, and those members of the industry who have relations with foreign countries, have often felt the need of a special dictionary dealing with automobile terms in the most widely spoken European tongues. Vocabularies of English-French and English-German expressions are notoriously incomplete when called upon to deal with the technicalities of the automobile. The want has been largely supplied by three volumes of the "Dictionary Autotechnic," published by Richard Carl Schmidt & Co., of Berlin. English, German, French and Italian are dealt with, equivalent expressions in each of these four languages being placed in parallel columns. Volume I has a list of German words in alphabetical order, followed by their equivalent in the three other languages; Volume II treats French in the same way, and the third volume arranges English words and phrases in the same manner. Although there are certain shortcomings in the translation of the more technical terms, the dictionary can be recommended for travelers and all ordinary use.

**M**ANY distinctive features of design and construction will mark the 50-horsepower Pennsylvania car for 1908, which will be officially known as Type C. Beginning with the motor, this is of the overhead valve type employing two camshafts and with separate rocker arms for each valve. The cylinder dimensions are 4 3-4 by 5 1-4-inch bore and stroke, respectively, and they are cast in pairs with water jackets integral, an unusually liberal allowance for water space having been made. The camshafts are each carried in four bronze bearings, and are located inside the crankcase, as will be evident from the view of the under side of the motor with the oil pan removed. They are arranged so that they can be withdrawn complete, including their bearings, through the end of the crankcase, and their driving gears are all accurately stamped so as to facilitate proper replacement.

**Valves.**—The same degree of accessibility is noticeable where the valves are concerned. The latter are mounted in cages housing the spring and other small parts, and combining to form a complete unit, which is locked in position in the cylinder head by means of a ring with a hexagonal inner face. A combination asbestos and copper gasket interposed between the valve cage and its seat insures a gas-tight joint and also allows for expansion. The valves are thus readily removable, and their withdrawal from the cylinder head exposes the interior of the entire combustion chamber, as well as the piston head, which is a great advantage when necessary to clean out carbon deposits. The valves themselves are made with cast-iron heads and nickel stems, while the rocker arms are hardened forgings and the push rods are tubular, with accurately machined adjusting ends.

**Crankshaft and Its Kindred Fittings.**—The crankshaft is a hollow drop forging, supported on die-cast bearings of liberal proportions, the latter insuring long freedom from undue wear. In addition to providing a great deal of jacket space, the circulating pump, which is of the gear type and gear-driven, has a large capacity, delivering 8 gallons per minute at 600 revolutions. The hollow crankshaft is utilized to facilitate lubrication, which is taken care of by a Kinwood pressure feed oiler, driven by an eccentric and strap from the flywheel end of the camshaft, supplying oil under 90 pounds pressure to the principal bearings. Oil leads are also taken to the timer, the tor-

sion hanger and ring, and to the gearset and rear axle, making six in all, besides which other moving parts are supplied with oil or grease cups. The clutch spring and thrust are lubricated from the hollow camshaft, while the wheels are packed with hard grease.

**Ignition.**—The high-tension system of ignition is employed, the timer being located on an aluminum standard accessible placed between and above the cylinder bearings. It is driven by spiral gears located on the interior of the crankcase and lubricated by splash.

**Transmission.**—As the first step in the transmission of the power, an internal cone type of clutch is employed, having a broad face, and with its angle so designed that it is free to a very large extent from the objectionable fault of taking hold jerkily. It is fitted with a ball spring-thrust, as well as a ball thrust at the outer end, to take up the strain when disengaged. Hardened steel dowel washers are used between the flywheel and crankshaft flanges and between the clutch cone and flywheel, as well as on all universal joint flanges. A double universal joint is interposed between the clutch and the end of the main driving shaft, these joints being designed with unusually large driving surfaces. The clutch and its universal are so arranged as to be not only accessible, but also easily removable. The reason for the use of these joints is to be found in the fact that the gear-set and rear axle driving mechanism are combined as a unit. The former is contained in the extension of the differential housing, which is made of manganese bronze. The gears are of one-inch face and are all made of chrome nickel steel, which is also true of the shafts, the latter being carried on liberal-sized annular ball bearings. Operation is by the selective method, and two sets of ball-bearings with spacers are placed adjacent to the

MOTOR OF THE PENNSYLVANIA "50," WITH VALVES IN HEAD.

UNDER SIDE OF MOTOR SHOWING CRANKSHAFT DETAIL.

bevel pinion, thus insuring absolute alignment, further precaution against derangement being found in the cage of roller bearings, fitted to the round end of the main shaft that rotates in the pocket gear. This insures a parallel position of the transmission shafts at all speeds. The driving thrust between the main bevels is taken up by a one-inch steel ball inserted in the pocket gear. In addition, a positive interlocking system is employed, so that the gear-set is not only designed to be extremely durable, but is also proof against accidental injury at the hands of the driver. It is constantly oiled direct from the pressure lubricator on the motor.

**Gearset and Differential.**—Some idea of the arrangement of this combined rear-axle unit and gearset may be obtained from the illustration, which pictures it with both the gearset and differential housing covers removed. The latter is a spherical casting of Parsons' manganese bronze. In addition to the many obvious advantages of this arrangement, practically every part of the transmission, with the exception of the countershaft, can be readily withdrawn through the open end of the differential housing. The differential itself and the driving shafts of the floating live axle are each self-contained and also easily removable. Five jaw clutches are fitted on the squared ends of the axle driving shafts, and engage their corresponding member mounted on the rear wheel hubs, this arrangement being clearly illustrated in one of the accompanying photographs. The weight of the car and stress of the load are taken care of entirely by large annular ball-bearings, and the differential is also mounted on similar bearings with self-contained ball thrust bearings. Taken all in all, the design is one that lends itself very readily to inspection or dismounting, beside combining with this feature a form of construction excellently adapted for the purpose in view. Chrome nickel steel is liberally employed throughout the components of the transmission, the driving bevels, main driving shaft, axle driving shaft, and the axle itself, as well as the torsion tube, all being made of this material. The last named member is supported at its forward end by a steel hanger, fitted with a spherical bronze ring, permitting the tube to travel longitudinally or circumfer-

UNIT TRANSMISSION AND AXLE OF THE PENNSYLVANIA.

entially, the whole being attached to the frame. The rear axle is securely anchored to the frame by means of adjustable tubular reach rods.

**Front Axle, Steering Arm, and Brakes.**—The front axle is a one-piece drop-forging with the spring saddles integral, while both the axle itself and the steering arm have been designed with an exceptional factor of safety. The weight of the car and pivot action is carried on one-inch steel balls, located in the dome of the yoke, and secured by a bronze bushing. A recess is made in the top of the spindle to receive the ball, this construction making it necessary to lift the entire weight of the car before the spindle can be removed from the yoke. The steering arms are attached to the spindles by means of tapered broached holes, and are securely locked, while the cross connecting rod is placed behind the axle. Two sets of brakes are fitted, the pedal or foot brake being of the external constricting type, while the emergency brake, actuated by a lever traveling in the change-speed guide, is of the expanding type. The wheels are carried on annular bearings, set to shoulders with spacers, this arrangement, as well as the brake construction, being clearly illustrated by the photograph showing one of the axle driving units.

**Chassis.**—The foundation of the chassis consists of the usual type of channel section pressed steel frame, heavily reinforced, and carried on a pair of 2x38-inch semi-elliptic springs forward with 46-inch rear longitudinal springs,

EXTERNAL AND INTERNAL BRAKE, AND REAR WHEEL BEARINGS.

shackled at the forward end, and tied to a transverse spring anchored to the frame by means of a steel bracket at the rear. The steering gear is of the external and internal worm and nut type, fitted with a spring socket tie rod end. The wheels are 34 inches in diameter and are fitted with 3 1-2-inch front and 4 1-2-inch tires rear. The steering column passes through a base attached to the dash and footboard, making it perfectly stiff, while the housing of the steering mechanism is securely fastened between the main and sub-frames. The spark and throttle controls are mounted in the customary fashion on a stationary sector over the steering wheel and are designed so as to be conveniently operated with the left hand. The body is made of aluminum and is designed to withstand road shocks without injury. Leather and hair upholstery on a liberal foundation of springs complete this essential of the car, the lines of which are neat and attractive, as will be apparent from the photograph illustrating the car ready for the road. Numerous pockets and compartments for storage, as well as a foot rest and robe rail, together with other similar fittings that go to complete the interior of the tonneau, are fitted. The wheelbase is 114 inches and the tread standard, while in complete running order the car tips the scales at 2,800 pounds. With the usual equipment of lamps, tools, and the like, the car lists at \$2,800, the makers being prepared to furnish an imported magneto at an additional charge of \$200. The same chassis is also equipped as a high-powered runabout by making several modifications.

MONARCH MODEL C, A NEW IOWA PRODUCTION.

### ANOTHER BUGGY-TYPE AUTO FROM THE WEST.

"Monarch Model C" is the official title of the car which will constitute the 1908 product of the Monarch Machine Company, Des Moines, Ia. As will be apparent from the illustration heading this column, the car belongs to that aptly-named class the buggyabouts, which are destined to form such an important factor in the automobile production of this country in the near future. The power plant consists of a single-cylinder, four-cycle water-cooled engine, with a 4-inch bore and 6-inch stroke, the latter making for economy in fuel consumption and consequent efficiency. It is rated at 5 horsepower, and, owing to its position on the chassis, it has been found possible to employ a flywheel so proportioned as to overcome to a large extent the infrequent impulses of the engine, and which also enables it to carry the load smoothly at low speeds. The cylinder and crankcase are cast together, of close-grained charcoal iron, and the engine complete is suspended from an angle iron frame in such a manner as to insure proper balance when working at its maximum load. The cylinder is bored, reamed and faced with special care, the same pains being taken in its construction as are employed in the making of much more expensive engines. The piston is cast of close-grained iron, of sufficient length to give proper bearing surface, and is fitted with rings cut at an angle in accordance with the best standard practice. The wrist pin is of steel, and of ample diameter, while the connecting rod bearings are of bronze, carefully machined. The valves are placed in the head, are mechanically operated, and the timing gears are machined from solid blanks. The valve action is taken direct from a single cam keyed solidly to the pinion. The valves are accurately ground to their seats and are held by tempered steel springs.

The illustration practically suffices to describe the remainder of the car. It has the typical buggy body, measuring 39 by 63 inches, with a hardwood floor, swell front spring cushion, heavy steel steps and good quality patent leather dash. The suspension consists of amply proportioned full-elliptic springs, three in all being employed, one placed transversely forward and the other two longitudinally in the rear. Both the front and rear axle are of 1 1/8 inch solid steel, the latter being of the coach style. A wheel steer is employed, the usual fifth wheel, consisting of a full-circle, double plate wrought iron construction with clip king bolt, constituting the remainder of the steering gear.

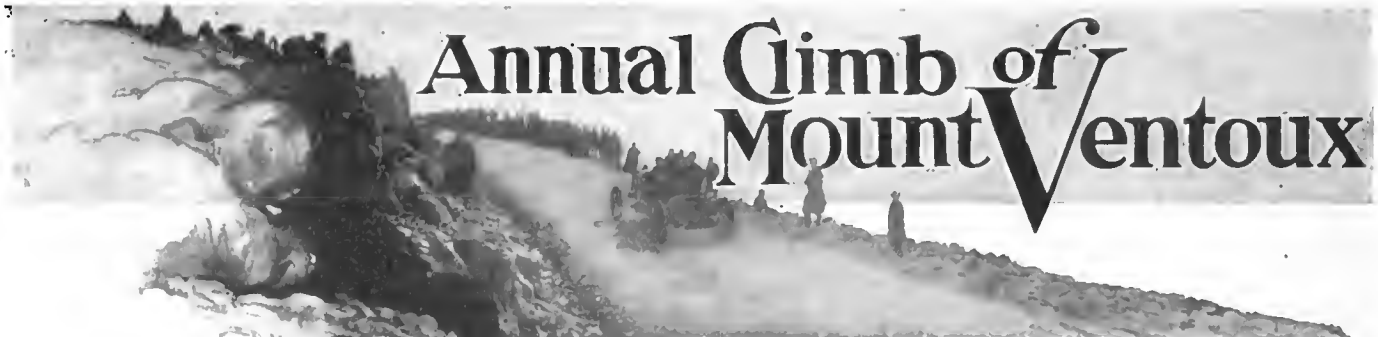

### HERE'S THE EVERYBODY'S AUTOMOBILE.

The name Everybody's given this new car, which hails from St. Louis, is suggestive of a machine designed for the use of the average man, and such has been the purpose of its makers, the Everybody's Motor Car Manufacturing Company, St. Louis, Mo. In fact, it combines many of those features which seekers after the ideal in automobile construction and design have agreed are indispensable to an automobile reduced to the lowest terms of simplicity. For example, its power plant consists of a two-cylinder, four-cycle, horizontal-opposed, air-cooled engine, which is rated at 10-12-horsepower. This is located transversely under a bonnet forward. The design gives a perfectly balanced engine with a minimum of parts for the power output required. Provision is made for cooling by casting the cylinders with a liberal amount of surface in the shape of fins, air being blown over them constantly by the large fan embodied in the flywheel, which is placed forward of the motor, thus producing a strong blast of cool air over the numerous deep and thinly cut fins. The cylinder dimensions are 4 1/16-inch bore by 4-inch stroke, both cylinders being made in a single casting. The cranks are set at 180 degrees, and the crankshaft is mounted on two liberal-sized bearings. The inlet valves are of the automatic type and are accessibly placed, while the removal of the large crankcase cover permits of reaching the entire interior of the motor. Lubrication is by splash, the supply in the crankcase oiling all the main bearings as well as the timing gears for the exhaust valves ignition timer, two sight-feed compression cups being placed directly on the cylinders and a third on the crankcase to maintain the supply in the latter. The normal speed is 900 r.p.m., and the engine may be speeded considerably above this with a consequent increase in power, though it develops ample power at low speeds.

The transmission is of the friction type, the friction disk being constructed of a special composition driving against a specially impregnated fiber pulley, the two materials having a maximum coefficient of friction and, consequently, great holding power. The contact between the two is controlled by a roller thrust bearing coupled to the clutch pedal. The change speed lever shifts the friction pulley horizontally across the face of the composition friction disk, giving a range of speed varying from a standstill to 30 miles an hour forward, and from nothing to 17 miles an hour on the reverse. Every part of the mechanism is made accessible by placing the engine under a bonnet and the transmission directly under the seat, permitting of its adjustment or oiling merely by lifting the cushion flap. Final drive is by means of double chains. The wheelbase is 78 inches and the weight 800 pounds; with pneumatic tires the car lists at \$450.

"EVERYBODY'S" RUNABOUT, AN AIR-COOLED WESTERNER FROM ST. LOUIS.

# Annual Climb of Mount Ventoux

**A**VIGNON, FRANCE, Sept. 20.—At the foot of a wild, cloud-capped mountain, in a romantic, sunny, south country, with strong attachments to the past, loud-lunged automobiles are being started by a medallioned official up a rough grade guarded by red-legged troopers. Exactly 13.42 miles away, in the calm and cold of the Government Observatory, a second official is recording the time of arrival of the diversified vehicles. Between those two points the machines, big and little, have been put to a rude test—as the French term it—for the hill is terribly difficult to climb, with its grades varying from 8 to 20 per cent., its stony and dusty surface and its sharp turns by the side of yawning precipices, unprotected by wall or barrier. Five years ago it was the "Mountain Despair" of all automobilists.

Yet these 13.42 miles were covered in less than twenty minutes—to be exact, in 19:59 2-5—by Rougier on the Grand Prix Dietrich. An average of 41.2 miles an hour on such a climb to the clouds is indeed fast going. It left Collomb's Rochet-Schneider record of last year a long way behind, but failed to lower the record climb, established by Cagno on a Fiat, by the narrow margin of 17 seconds. It had been damp during the night, and the turns were rather too wet to expect record performances. Bablot, handling the Brasier Grand Prix racer, with which he broke a world's five-kilometer record down in the plain at Salon a few days before, made a very poor start, went terribly fast as he neared the top, but was 29 seconds slower than his rival from the

north. Both were equipped with Michelin tires and derived their ignition from a low-tension Simms-Bosch magneto.

The going was fast throughout on this second day, for all the stripped tourists were powerful machines. Classification was according to cylinder area and weight. An exception was made for the six-cylinder class, allowed to run irrespective of size of cylinders or weight. It was in this division that a Rossel, handled by Jenné, made the fastest time of any tourist—24:54 4-5. A second Rossel was three minutes behind, and an Aquilla Italiana third. Last year's records were all made to appear small.

A Cottin & Desgouttes, in the 117 to 125 mm. bore class, was next best in 25:16 4-5 for the 13.4 miles. Brouhot won in the class approximating 24-30-horsepower, time 28:04 3-5; Mors made 28:22 in the 30-40-horsepower class, and Radia won in the 40-60-horsepower series with 25:44 1-5.

There was less public interest in the first day's event, devoted to motorcycles and small runabouts selling at something round \$800, but there was an excellent demonstration for supporters of popular automobiles. Some of the drivers had not the experience of Rougier and Bablot, and gave the hazardous spectators an occasional scare on the turns, but not a single machine showed weakness. Little 110-pound motor bicycles reached the top in less than 40 minutes, and, at the other end of the scale, an eleven-passenger Ariès omnibus made the climb with full load in 1 hour 27 minutes.

## COMING EVENTS AS SHOWN BY THE AUTOMOBILE CALENDAR.

### AMERICAN.

#### Shows and Meetings.

- Oct. 24-31.....—New York City, Grand Central Palace, Eighth Annual Automobile Show, Automobile Club of America and the American Motor Car Manufacturers' Association.
- Oct. 26.....—New Haven, Conn., Second Regiment Armory, Third Annual Automobile Show, New Haven Business Men's Association.
- Nov. 2-9.....—New York City, Madison Square Garden, Eighth Annual Automobile Show, Association of Licensed Automobile Manufacturers.
- Nov. 9-16.....—Philadelphia, First Regt. Armory, Automobile Show, Philadelphia Automobile Trade Association.
- Nov. 16-23.....—Baltimore, Third Annual Automobile Exhibition, Automobile Dealers' Association. E. R. Johnson, manager, Piper Building.
- Nov. 29-Dec. 6.—Chicago, Casino Garden, Second Annual Auto Parts Show. A. M. Andrews, secretary, 184 La Salle street.
- Nov. 30-Dec. 7.—Chicago, Coliseum and First Regt. Armory, Eighth Annual National Automobile Show, and First Annual Commercial Vehicle Show, National Association of Automobile Manufacturers.
- Dec. 14-21.....—St. Louis, Mo., New Coliseum, Second Annual Auto Show, St. Louis Automobile Manufacturers' and Dealers' Association.
- Dec. 28-Jan. 4.—New York City, Madison Square Garden, Importers' Salon. C. R. Mabley, secretary and manager.
- Feb. 3-8.....—Buffalo, Convention Hall, First Annual Power Boat and Sportsmen's Show, auspices of Buffalo Launch Club. Dai H. Lewis, manager, 760 Main street, Buffalo, N. Y.
- Feb. 20-Mar. 7.—New York City, Madison Square Garden, Fourteenth Annual Motor Boat and Sportsmen's Show.

- Mar. 9-14.....—Buffalo, Convention Hall, Sixth Annual Automobile Show, Automobile Club of Buffalo. Dai H. Lewis, manager.
- Mar. 21-28.....—Toronto, Canada, St. Lawrence Rink, Automobile Show. R. M. Jaffray, manager.
- Apr. 5-12.....—Montreal, Canada, Arena, Third Annual Automobile and Sportsman's Show. R. M. Jaffray, Mgr.

#### Races, Hill-Climbs, Etc.

- Oct. 4-5.....—Trenton, N. J., Inter-State Fair Automobile Races, Includes 24-hour Event.
- Oct. 19.....—Kansas City, Mo., Kansas City Jockey Club Track, Race Meet, Automobile Club of Kansas City.
- Oct. 21.....—St. Louis, Mo., International Aerial Race of the Gordon Bennett Prize, Aero Club of America.

### FOREIGN.

#### Shows.

- Sept. 28-Oct. 7.—Denmark, Copenhagen International Auto Show.
- Nov. 11-23.....—London, Olympia Motor Show.
- Nov. 12-Dec. 1.—Paris, Exposition Decennale de l'Automobile, Grand Palais, Esplanade des Invalides, Automobile Club of France.
- Nov. 22-30.....—London, Agricultural Hall, Stanley Show.
- Dec. 5-22.....—Berlin, Germany, Automobile Show.
- Jan. 18-Feb. 2.—Turin, Italy, Fifth International Automobile Exhibition, Palace of Fine Arts, Valentino Park, Automobile Club of Turin.

#### Races, Hill-Climbs, Etc.

- Oct. 1-15.....—Paris Electric Vehicle Competition, A. C. F.
- Oct. 20.....—France, Gailion Hill Climb.
- Nov. 1-15.....—France, Volturette Contest near Paris.
- May 16, 1908.....—Sicily, Targo Florio, Automobile Club of Italy.
- June 20-July 5, '08—Grand Prix, Dieppe Circuit, Automobile Club of France. (Exact date to be announced.)

**E**VEN had the automobile and the fashion of touring been current at such a time, to have suggested an auto tour of Bosnia thirty years ago would have been the same as suggesting a tour to the head waters of the Nile. Not alone would no trace of roads or of accommodations have stared the prospective traveler in the face, but his very life would have been endangered by the peoples of the localities. Today a tour of Bosnia would be one of the most delightful in Europe.

This is chiefly so from the fact that Bosnia, although nominally a part and parcel of the Ottoman empire, is *de facto* an Austrian province, but under military government—which tolerates the delicious fallacy that the occupation is but a temporary one, and that everything is still in the "field." Permanent post-offices, railway lines, roads, and bridges are all labeled "field appliances" in order to keep up the fiction. Howsoever that may be, the military government gives the civil authorities despotic power to order this, that and the other improved, and there are thousands of soldiers sent down each year to do this work, at no cost whatever to the government. On the other hand, the hatred between Austria and Hungary keeps the officers of either side in the joint government of Bosnia in line, and all the evils which autocracy usually imposes on a people are eliminated.

**Ideal Roads Are Everywhere in Evidence.**

As a consequence the roads in Bosnia to-day are the pink of perfection. Taking the course of the donkey trails, they follow blue foaming rivers into narrow canyons, where even at the present time brigandage seems possible, and where the lone cavalry police at an occasional turn of the road is the sole guarantee of one's safety. But these roads are so picturesque that they weave a spell, causing one to wish to return again and again. There are the donkey-trains, laden with panniers of ruby-red apples or with the hay piled so high about the animal's flanks as to make one wonder as to the whereabouts of the donkey itself. There are the Christian peasants, the men ahorse, the women and children following afoot, one and all in gay costume, and, over all, the red braided turban, which, though the replica of the headwear of the Riffians of India, marks the Bosniac from the Mussulman in Bosnia.

Moslems there are, too, along the road; and while up to the time of the occupation Turk and Christian lived in towns carefully apart, to-day their farms adjoin in the villages. The home

of the Moslem, however, is marked by the lattices at its windows, the little latticed porticos and the high walls with the knockers to the doors—that the women may take an airing unseen by passing men. In the occasional kavana, or coffee-house, the tavern of the Nearer East, one meets these hooded damsels—the fingernails and the hair dyed with henna, the face shrouded in veils of white, with a slit just over the eyes. Behind them trudge the children—the girls in bloomers, tied in at the ankles, their hair in two stumpy braids down the back, and likewise fiery red with henna; the boys in more openly bisected bloomers and a calico waist much beflowered.

**A Government-Controlled Hotel System.**

Beyond the road is the town, and there one finds the true delight of autoing in Bosnia. In order to encourage the traveler, the government has taken over the hotel system, and has erected splendid hotels, as fine as any in the world. These it leases out, but only after setting the price that may be asked for each room, each service, each item of the bill of fare, and then posting these printed lists conspicuously over the building. In this wise the hoteliers of Bosnia become the most honest in the world.

The cities, and notably the capital, Sarajevo, are taking on the street-building mania, and at this isolated capital asphalt ways lead on as they would in the suburb of an American metropolis. Shopping with the automobile at Sarajevo would be true delight indeed, for there is built the grand bazaar, hundreds of the open shops, all of one kind together and all exposing their wares in the low booth at the front. Colors that dazzle and please the eye are everywhere in this perpetual exposition.

Then, too, for him who has the love of adventure within him there can be made a long ride—a two days' trip over the border into Turkey—following in the wake of the mail caravans, when soldiers ride upon the seats of the stages and the entire roadway is policed. After that one goes through at his peril, but so gorgeous the scenery in these Balkan uplands that all thought of risk is forgotten. As yet the auto tour of Bosnia is unknown. In Budapest there is a semi-governmental bureau which sees to it that the touristy of all the Austro-Hungarian domains is exploited. One of these days it will take up the matter of autoing in Bosnia, and with the affable Austrian and Hungarian military officers for one's hosts—the most charming officialdom in Europe without a doubt—such trips will be a rare treat indeed.

As an automobile country Servia soon falls on the traveler. Endless plains, grain-fields, and occasionally oak forests where mass the famous herds of Serb swine, and then some little brown-walled red-roofed village, with the somewhat clumsy inhabitants in a deep chocolate-brown woollen suit and cap of the same material. Servia, too, is not sufficiently primitive to interest, nor are her highways so modern as to make autoing for the pure love of the thing exhilarating. So, unless one simply cares to establish a record of having made a tour in every country of Europe he may as well leave this kingdom out.

Roumania, however, is another question. Poverty-stricken, suffering Roumania is interesting for all that it lacks. To auto in Roumania, more than in Turkey in fact, one must carry his own supplies, his own repair-shop, his own commissary with him. In the little villages there are

THE BAZAAR AT SARAJEVO.

not taverns, but mere grog-shops, so poor that there is only the *peler*, or native wine, and the round, unsalted pretzels, strung across the ceiling, to be had, and, hungry as the tourist may be, if he has not taken food from the nearest big city he must keep growing hungrier still. The secret lies in the agrarian conditions in Roumania. Such is the poverty, due to the holding of the land by the great *patroons*, or land-owners, that the peasant is but too glad to sell all his crop as soon as marketable, all his dairy produce as soon as made, that he may have cash to pay debts perhaps already long overdue. For himself and family he reserves just enough to keep him until next harvest-time, and even then the wolf is ever at the door. The real wolf and the figurative both, for in the cruel winters sweeping these Wallachian plains the wolves come around

THREE GENERATIONS OF SERVIANS.

Roumania is at her best. Out in the long, unbounded grain-fields picturesque peasants—men, women and children—garner the crop. As in old Bible times, the child sits upon the plow to keep it deep in the furrow, but unlike Bible times, and despite the fanaticism of pope-power in this land, the ox is muzzled at the plow, that he may not devour one morsel of what might be sold for hard-earned silver.

THE PICTURESQUE NATIVE MALES.

the villages and bay all night.

In the harvest season

A BELLE OF SARAJEVO.

As for scenery, it is variant. There is the enormous hay-stack, tall as an East Side tenement and almost as redolent, to which landlord and peasants one and all bring their hay as precaution against incendiaries. There is the wheat, or the corn, or the barley, and the meadow, and now and then a beet field or melon-yard. Between are the villages, woe-begone and smacking largely of Dahomeny in Africa. Houses are of a wattling of the branches of the willow, or else of a reed from the Danube, here and there coated over with adobe for plas-

ter, and this perhaps tinted in pale lavender, with a broad band of blue at the sides. To the one-story houses there is a little narrow porch and there hang the peppers and the mangoes, ripening in the sun, while upon the earthen floor of the portico the corn is gathered in great golden piles.

And the people, the simple, tanned, and not unkindly peasants—they are pretty, for their costumes of lavender, all with stitchings in a deeper violet or in purple, and with clean white shirts beneath the coat, to afford the needed contrast. Still more primitive are the gipsy villages, mere burrows in the earth, with the orifice extended and hedged in with boughs, as to some cyclone cellar of Kansas. There the happy-go-lucky nomads swarm the roads, women and children striking their faces and pulling their hair to invoke the passer's pity, that he may throw them a few centimes for "sugar."

Of course, there is the other side to the picture. If one is willing to stick to the

BOSNIAN YOUTH.

WOMEN OF THE HERZEGOVINA.

cities, notably Bucharest, he will have as easy riding as he would in France. Streets are wide and of macadam or asphalt; there are handsome cafés, with plate-glass windows, gipsy orchestras, and polite waiters everywhere; there are *chaussées* leading out to parks, as the Bois de Boulogne; there is a clearly-defined right-of-way for vehicles bound in each direction, and in fact every accompaniment to autoing in a big city is to be enjoyed. That presents little of the unusual. It is the interior of Roumania that would provide the unique. And as for it—it has hardly been visited by the automobilist.

In order to improve touring conditions in France the national authorities are particularly busy at the present time in the organization of touring centers where travelers may have a central point from which to make excursions to spots of interest. Each center will be provided with the necessary guides, maps, and information on touring within that district. Good results are expected from a competition now being held by the A. C. F. for improvements in the management and organization of hotels.

## Next A Mile-a-Minute on Water

TRIPLE CIGAR-SHAPED HYDROPLANE DESIGNED FOR RECORD SPEED BY SANTOS-DUMONT

PARIS, Sept. 23.—Santos-Dumont has made such progress with the hydroplane guaranteed to cover more than sixty-two miles in the hour that an attempt to realize on water this stupendous speed hitherto deemed impossible might be looked for in about two weeks. It will be remembered that Santos-Dumont made a bet with Fernand Charron, the well-known sportsman and automobile constructor, that he would travel on water 100 kilometers (62.1 miles) within the hour. The stakes were \$10,000.

This week, at his private workshop in Neuilly, the young Brazilian aeronaut gave an opportunity to a few friends to inspect the machine with which he expects to accomplish his record-breaking clip. The hydroplane consists, as will be seen from the illustration, of three cigar-shaped floats, built of aluminum and wood and covered with a silk waterproof envelope. The center float is a little more than 32 feet in length, the two others being about a third that size. The three floats are united by a light metal cross frame, and above the center cigar is a raised skeleton platform on which the motor will be mounted. At the rear is a transverse wood float attached by means of metal stays to the tail of the cigar. It is above this frame that the operator's saddle has been fixed, the rudder to be placed later almost directly under.

Without motor or propeller, the hydroplane weighs less than two hundred pounds, which is one of the lightest constructions ever made for its size. In all probability the three cigar-shaped floats will be filled with compressed air. Arrangements have

been made for the supply of a special 16-cylinder Antoinette motor to develop 120 horsepower and not to weigh more than one kilogramme per horsepower; thus the weight of the engine will be about 260 pounds. M. Levavassor, the maker of the Antoinette, has supplied all the motors for Santos-Dumont's latest machines and has made such progress in the construction of light motors that he guarantees weight not to exceed one kilo per indicated horsepower.

Santos-Dumont declares that he bases his success largely on the great saving of weight he has been able to accomplish. Previous attempts at producing high speed hydroplanes have failed, in his opinion, because of needlessly heavy construction. It is certain that the latest addition to the hydroplane world will not err in this respect. No. 18, as the Brazilian inventor has christened his apparatus, for it is the eighteenth in a varied line of balloons, hydroplanes and aeroplanes, is a masterpiece in the art of eliminating skin friction, and appears likely, driven by a reliable motor, to attain the prolonged speed for which it has been built.

Nothing is known as to the place where the trials will take place. The conditions of the wager stipulating that sixty-two miles shall be covered within the hour, and not that the boat must travel a few seconds at that rate, an open sheet of water must be found. At the same time the water must be calm for a hydroplane is essentially a fine weather and smooth water craft.

### FRENCH BALLOON AND AEROPLANE CONTESTS.

PARIS, Sept. 29.—A drizzling rain and a strong southeast wind marked the start of the third annual balloon race of the Aero Club of France from the Tuileries Gardens. M. De Nobel, piloting *Le Nord*, was picked up in the North Sea, 25 miles from Ostend, and is probably the winner.

M. Bleriot has traveled a distance of 600 feet, at a height of 50 to 60 feet from the ground, in the aeroplane bearing his name, thus winning the bronze medal of the Aero Club for a flight of over 490 feet. Unfortunately Bleriot retarded his ignition too rapidly at the end of the flight, bringing the machine to the ground so suddenly that it was demolished. The 16-cylinder Antoinette motor was intact and no injury befell the pilot.

During his visit to Paris, Charles J. Glidden took a course in aeronautics under the direction of expert French balloonists. The longest ascension of the American automobilist was 54 miles, covered in four hours, maximum height being 1 3-4 miles.

### GERMAN PILOTS FOR BENNETT CUP EN ROUTE.

Captain von Abercron, the well-known aeronaut, accompanied by Herr Erbsloeh and Hecker, left Bremen on September 24, on board the German Lloyd steamer *Kronprinz Wilhelm*, on their way to St. Louis, where they will participate in the balloon contest. They brought with them the two balloons to be used in the race.

### GOVERNMENT AID FOR GERMAN AIRSHIP.

FRIEDRICHSHAFEN, GERMANY, Sept. 24.—According to balloon experts and members of the Imperial Government who witnessed the renewed experiments of Count Zeppelin's airship over Lake Constance, the German aeronaut has developed his system to a remarkable degree of efficiency. A Government subsidy of \$40,000 has been made to assist him in his experimental flights.

One of the weaknesses of the Zeppelin airship is the impossibility of making an ascent without the use of the regular anchorage structure. If the airship were obliged to come down away from its base or from an open sheet of water, it would certainly be damaged, for it would be without means of rising again, and, owing to its size, could not be transported across country. It is about 400 feet in length and 50 feet broad.

### DIRIGIBLE AND AEROPLANE TESTS AT ST. LOUIS.

In connection with the balloon competition for the Gordon Bennett aeronautical cup, to be started from St. Louis on Monday, October 21, the Aero Club of that city will offer special prizes amounting to \$5,000 for aeroplane and dirigible balloon competitions. There will be distinct races for the two classes held within the club enclosure, over a course three-quarters of a mile in length. The first prize winner in each will receive \$2,000 and the second \$500. Entry blanks have been issued and can be obtained from J. W. Kearney, club secretary.

**"Good Roads and the Sane Use of Them."** That was the rallying cry of the first good roads and legislative

convention held by the automobilists of the country—to give credit where credit is due: held by the far-seeing Automobile Club of Springfield in the commonwealth of Massachusetts. 'Tis well that the autoists have elected to work openly for the improving of the roads, and equally fit that they have publicly shown willingness to discuss with those entrusted with the building of the roads as to the new needs of highway construction resulting from the coming of the motor-driven vehicle. And the lawmakers were participants in the convention, which thus touched upon the building of roads in such manner as to meet changed conditions and also debated how to use these same highways sanely and with due consideration to one another.

Facts are stubborn things sometimes, and a condition and no theory confronts automobilists as a class. Increased mileage exacted from the roads inevitably wears out the thoroughfares more quickly, and the man who travels a hundred miles in a day, as compared to one who covers only ten miles, cannot object to paying more for the upkeep of the highways. An annual registration fee should attend to this phase of the situation, and such a solution has been accepted in one State, with others likely to follow the same plan. This is where the autoist, for his

greater use of the road, pays more than does the owner of the horse-driven vehicle, which has much the lesser mileage.

But as to whether the automobile wears out the road—except by greater mileage—any faster than does the sharp-shod horse and its narrow-tired wagon, is a subject that can be discussed very forcibly from the standpoint of the automobilist.

Nevertheless, the roads are wearing out faster than ever before because of greater use, and something more enduring is demanded. Therefore, it is up to the roadmakers to meet the emergency and they are not averse to asking the automobilist for aid and suggestions in the premises.

Sane use of the roads, and laws to compel such sane use, has become the task of the automobilist, and daily it is more apparent that the owners of the motor-driven vehicles for their own protection, as well as for the purpose of being good citizens, must assist in the suppression and extinction of these heedless buccaneers of the highways. The antagonism of the public is not discriminating, but it is aroused to a degree that results in annoyance and often persecution of law-abiding autoists, who must in self-defense turn upon the erring ones and bring them to their senses or else to their just deserts. Condoning by silence the criminal driving of the few is no longer possible nor excusable; the guilty must be singled out and the executors of the law assisted in doing their duty. Only in this way will the day of the ineffective and unjust speed-trap be brought to its close.

The present administration of the A. A. A., unless we are much mistaken, may be trusted to continue nationally and through its State associations the work so convincingly begun by the successful initiative of the wideawake Massachusetts club.

**Opportunities Offered by the Automobile Industry.**

Due to the influence of what most aptly may be termed the "fast" element in the automobile business, a popular misconception that the latter was something which, in the vernacular, offered opportunities galore for "easy money," became prevalent several years ago. Under this misguided impression, numerous small capitalists plunged their all into the business of "manufacturing" automobiles, which meant buying stock parts of questionable value and assembling them in a manner even less commendable; others have invested their entire available capital in procuring agencies and then sat back to wait for the vast profits that never came; and, more numerous than either of these classes, hundreds of young men have found that work and faithful service are as much requisites of success in the automobile business as in any other line of endeavor.

Of the many who have rushed headlong to this new El Dorado, only to find its promises of untold wealth fade on closer contact, doubtless the ones most sorely deluded have been drawn from that large class that is ever on the *qui vive* to find berths that promise large returns as a reward for little or no effort. Like the opening of a new mining camp, it was inevitable that the overnight growth of such a great industry should have been attended with more or less profligacy, and it is equally true that hundreds of incompetents and ne'er-do-wells profited greatly thereby. Attracted by the thought of being able to do likewise, many have looked upon the automobile industry as an easy path to fortune, only to find to their sorrow that the reality did not correspond with their dreams. The frequency with which queries regarding the advisability of entering the automobile business come to light, many of them appearing in these columns from time to time, makes the occasion opportune to comment upon it, and the statement of a practical man taken from a contemporary and reproduced elsewhere in this issue furnishes an adequate answer as well as one that carries considerable weight. While it was inevitable that such conditions would obtain in the early days of the industry, it was likewise equally certain that their duration would not be a matter of great length, and it is fortunate for all concerned that the end is in sight.

## “GOOD ROADS AND THE SANE USE OF THEM”

THE good roads and legislative convention of the Automobile Club of Springfield, Mass., held September 24-25, marks an epoch in the advance of automobiling, and the promoters of this get-together gathering deserve unstinted commendation. That one club should have had the foresight to show the way the national organization of automobilists is honor indeed, and tracing back the growth of the idea one finds that H. E. Marsh was the original suggester, and a trio—consisting of Dr. V. J. Irwin, president; S. L. Haynes, ex-president, and Dr. W. R. Weiser—lost no time in moving a hearty second. Then the work began, and culminated in a well-attended session and a bumper banquet.

These are the A. A. A. clubs which sent delegates: Automobile Club of America, New Jersey Automobile and Motor Club, Automobile Club of Buffalo, Bay State Automobile Association, Massachusetts Automobile Club, Rhode Island Automobile Club, Long Island Automobile Club; Automobile Club of Pittsburg, Automobile Club of Germantown, and Wilkesbarre Automobile Club, all of Pennsylvania; Worcester, Brockton, Pittsfield, Wachusett and Malden, all from Massachusetts; Hartford, Bridgeport and New Britain, of Connecticut; New York, Albany, Rochester, Adirondack and Richmond County, from New York State.

President William H. Hotchkiss, First Vice-President Lewis R. Speare, Secretary F. H. Elliott, R. P. Hooper, chairman of the Good Roads Board, and A. G. Batchelder were the national representatives of the A. A. A.

Highway Commissioners McDonald of Connecticut, McClintock of Massachusetts, Edwards of Rhode Island, Sargeant of Maine and Deputy Beman of Pennsylvania supplied the good roads artillery, and Dr. A. S. Cushman, assistant director of public roads, Department of Agriculture, was another speaker listened to with intense interest, for he spoke in a governmental tone. Then there was Congressman Gillett, State Senator Hayes, Editors Langtry and Howard of Springfield dailies, a goodly amount of legal talent and an overflowing room of listeners. All around, it was a mixture of road builders, road users and law expositors. Of course, good couldn't fail to result, and the inevitable outcome was the decision that the A. A. A. must hold a much more extensive event of the same character some time next summer.

Herewith are extracts worthy of repetition in printed form:

**W. L. Dickinson, ex-treasurer of the American Roadmakers:** "This is the first meeting of the kind that has ever been held in the United States. Autoists have not concentrated their actions toward good roads in the past, and I am proud that the Automobile Club of Springfield is a pioneer in this work, and I hope that the good example it has set will be followed by all of the automobile clubs in the United States."

**Dr. A. S. Cushman, assistant director of Public Roads, Department of Agriculture:** "The modern road problem has two important aspects: First, the public road is a feeder of our civilization. We take pride in our crops and products, but it is the public roads that must connect them with their market. It is a strange paradox of American progress that we have developed wonderful harvesting machinery and at the same time overlooked the construction of those roads over which the harvested grain must be carted."

**William E. McClintock, Chairman Massachusetts State Highway Commission:** "The first talk that I ever gave on the good roads question was before an old bicycle club in 1893. The State made its first appropriation for improved roads in 1894, and since then to date has appropriated a total of \$6,500,000. Modern use of roads has brought about changes that tax the skill of roadbuilders."

**James H. McDonald, Connecticut State Highway Commissioner:** "This is the starting point that means a new era in road building, and the more of these meetings that are held the better for this country. In the last twelve years Connecticut has given \$3,000,000, and has now appropriated \$4,500,000 to make good roads. The speaker has seen the havoc wrought on highways by automobiles, but there was no dissenting voice to the passage of Connecticut's liberal law, so automobilists are free to use any road in the State.

The object of the law was to fix the fool and the hog and do away with the grafter."

**J. H. Edwards, Chairman Rhode Island State Board of Public Roads:** "A good road may not always be an ideal one in every respect, but it must meet the requirements of all normal uses. Automobiles are subjecting roads to an abnormal strain and wear not contemplated by builders. They are to become a permanent factor in our traffic, and the road builders must solve the problem which they present."

**William H. Hotchkiss, President, American Automobile Association:** "No club in this country out of over 150 and more has had the courage to hold such a convention, and the national association must see to it that such conventions be held every year."

**Robert P. Hooper, Chairman, A. A. A. Good Roads Board:** "I think it is time that some one told of what the autoists have done. The movement for good roads was begun by the bicyclists, and

### GOOD ROADS REGARDS APPROVINGLY THE MOVEMENT FOR HIS IMPROVEMENT

THIS CARTOON APPEARED IN THE SPRINGFIELD "UNION."

has been taken up and advanced by the autoists. Our damage to the roads has been more than offset by the good work we have done in their behalf. I say that it is proper for the autoists to be compelled to obey the law, but we do object to the existing laws. We think that the money paid in fines ought to go to the State highway commissions. Why should the automobilists pay a tax, when any wagon can draw any load over the same roads? I see no reason why the wagon drivers should not help to support these roads. The time has passed when the farmers can think we are of no use and are criminals."

**Congressman F. H. Gillett of Massachusetts:** "I like your motto, 'Good roads and the sane use of them.' I am glad that it is the spirit of this convention. The last half of it particularly all automobilists should emphasize and live up to, for unless we do use the roads sanely, reasonably, and moderately, we are likely not to get the good roads at all."

#### What an A. C. A. Delegate Thought of the Convention.

J. F. Plummer, Jr., a member of the A. C. A. Good Roads Committee, who, with W. W. Niles, chairman of the A. C. A. Law and Ordinance Committee, attended the Springfield convention, expressed himself in this manner as to the gathering:

"I was very favorably impressed with the whole idea of the meeting. It was really the first time that the two interests have gotten together in an amicable way. I mean by that the users and the builders of good roads; and the legislators also figured in the proceedings. I think the friendly feeling shown on both sides, particularly by the Highway Commissioners, indicates excellent results for the future. To use an old expression, it is possibly the beginning of the dawn of a new era. The annual national convention, which will grow out of this first affair, ought to prove a great benefit to automobiling in general. The club deserves a great deal of credit. Personally, I believe the A. C. A. should support a movement of this character, and I am confident that its influence will be unhesitatingly given to such commendable work."

### WHY "RAINIER" CANNOT BE TRADEMARKED.

WASHINGTON, D. C., Sept. 30.—A decision has been rendered by the Commissioner of Patents wherein registration of the word "Rainier" as a trademark for automobiles is refused the Rainier Co. Registration was refused on the ground that the word "Rainier" is geographical and on the further ground that it is the mere name of an individual not written in a particular or distinctive manner. That the word "Rainier" is the name of an individual was not controverted by the applicant, but it was contended, first, that it is not merely the name of an individual, and, second, that if it is merely the name of an individual it is written, printed, or impressed in a peculiar and distinctive manner and therefore registrable.

### THE GARDEN GODDESS LOSES HER JOB.

From A. L. A. M. Show Publicity Department.

"The chaste plaster goddess who presided over the last automobile show in Madison Square Garden has lost her job. She and her attendant nymphs, who peered impertinently at show patrons from the many pillars of the Swiss garden scene, which was the

setting for the show, have been turned adrift by the committee in charge of the eighth national show, to be held in the Garden, November 2-9, and an entirely new scheme of decoration is in favor. This, it is said, will be less ornate, but on the whole more rich and elegant and more in keeping with the exhibit. In token of this, a new show girl, duly licensed under the Selden patent and more up to date in costume than the goddess of the last show, has been chosen as the tutelar deity of the exhibition.

The Garden show will have "telharmonic" music.

### CHAIRMAN THOMPSON ON EUROPEAN EVENTS.

Although but a few hours disembarked from the White Star liner *Baltic*, in from Liverpool, buried under a shoal of correspondence and inundated with telephone calls, Chairman Jefferson DeMont Thompson readily pushed back his chair when a request was made for a chat on automobile events in Europe.

Being one of the leading spirits in the Long Island Parkway, Mr. Thompson was particularly interested in the autodrome constructed by a syndicate of British sportsmen at Brooklands, near London. As a special racing and testing ground for automobiles, Mr. Thompson declares the track to be the most wonderful thing of its kind ever seen. Although there has been one fatal accident, of which he was a witness, the track is as safe as human ingenuity can make it, the appointments are excellent, and the management absolutely clean and sportsmanlike. A large number of influential sportsmen with no trade interests were enthusiastic over the course and would certainly make it successful.

The venture has not been a financial success, though this did not surprise the promoters, who declared before the course was opened that they did not expect it to be a money-making affair. The only drawback to the Brooklands track was the difficulty in reaching it by automobile, for although only thirty miles from London, roads are so narrow and winding and so carefully watched by the police that the journey cannot be accomplished in less than two hours.

Mr. Thompson was much interested in the challenge of S. F. Edge to race a team of six Napier cars against a team of six from any other factory. Mr. Edge gave an assurance that he would take part with a six-cylinder Napier in the next race for the Vanderbilt Cup.

Considerable attention is being paid by Britishers to the tarring of highways, there being hardly a town or village in the popular touring districts which has not been treated in this way. A wonderful example of the value of tarring was shown in the Avenue du Bois de Boulogne, at Paris, which, before being treated was constantly in bad condition as the result of heavy automobile traffic. Treated in a scientific manner with tar, its surface does not disintegrate and it is always free from dust. Mr. Thompson stated that he had obtained particulars of this system and would strongly recommend its use on the Long Island Parkway.

All European constructors were closely interested in the Vanderbilt race and regretted that it had been impossible to hold that event this year. In France, Darracq, Panhard, Dietrich, Hotchkiss and Bayard-Clement all offered one or more cars for next year's race, and a full Italian team was assured by Fiat, Itala and Bianchi. Germany would send a couple of Mercedes and possibly one Zust. The Minerva firm, of Belgium, also showed some interest in the event.

What particularly struck Mr. Thompson was the number of American cars touring in France. At the Bousquet garage in Paris he saw twenty-five or thirty of the best-known makes, and a large number at Fournier's garage. Three years ago an American touring in an American machine was a rarity. There appeared to be no opening for the sale of American cars in France, but in England conditions were different. The prejudice which once existed against American-made automobiles had almost entirely disappeared and prospects of an increased trade seemed bright. American lamps were a conspicuous feature on automobiles throughout Europe.

Germany this year is rather in disfavor among automobile tourists owing to the clumsy and ill-advised tax according to length of stay. Trouble generally befalls tourists through ignorance of the laws. When these are carefully observed foreigners may always rely on courteous treatment. Much is being done by the personal influence of Emperor William to popularize automobiling. At Homburg Mr. Thompson had an opportunity of inspecting the Imperial garage under the charge of Werner, for many years chauffeur and race driver of the late Clarence Gray Dinsmore.

AUTO FUNERAL OF ROY REHMS, CONDUCTED BY THE CALIFORNIA CHAUFFEURS' ASSOCIATION—THE SECOND CAR IS THE HEARSE.

## ANOTHER FATALITY CONCLUDES CALIFORNIA TRACK RACING

By R. R. L'HOMMEDIEU.

SAN FRANCISCO, Sept. 25.—The track racing game in California has undoubtedly been brought to an abrupt ending by the sad accident last Saturday on the Del Monte track, when Roy Rehms was killed. This unfortunate occurrence, coming close on the heels of the taking away of Ernest Kelly the previous Saturday, has caused the dealer, owner, and public to demand that the game be stopped. Rehms, at the time of the accident, was driving a beautiful race, had taken the Matheson car over twenty-four miles of the fifty-mile contest in grand style, and was just making the first turn on the twenty-fifth mile when the inner tube in the rear inside wheel blew out, which caused the car to swerve inwards, and Rehms, evidently cranking his car too sharply to avoid the fence, undoubtedly brought the full weight of the car and momentum broadside on the forward wheels, dishing the inside one. The car turned over once and a half times before it stopped. Those who saw the accident say that Rehms was thrown clear of the car and was on his hands and knees when the car rolled over the last time. When found, the hub of the rear wheel was pinning his head to the ground, having crushed the base of the skull, the jaw bone and the bones of the neck, producing instant death.

Herbert Martin, who in the Fourth of July races on the same track drove the big six-cylinder Stevens-Duryea to victory, was acting as machinist at the time. Luckily he was thrown clear of the car and only sustained a broken collar bone and shoulder blade, with some internal injuries near the base of the spine. The latter, however, are not serious, and at the present writing he is supposed to be well out of danger and on the road to recovery. The fifty-mile race for touring cars of 25 horsepower and over, in which the accident happened, was the last event of the day. Up to that time all the contests had been run off smoothly without the slightest apprehension of what was to follow. The track was in fine condition, there being no dust at all, and the killing of Rehms fell like a bombshell.

From an investigation made yesterday of the tires, it looks as if the direct cause of the disaster was the use of a four and a half inch lug in a five inch tire. There are signs on the inner tube of pinching where it rested on this lug, and continuing on a line with this pinching is a small blow-out. The Diamond casings are perfect, and good for many miles more. Another bad feature brought out in the investigation was that on this heavy car only five lugs were used, two of them being four and a half inch. The club which gave the races is one of the wealthiest organizations in this State, and of late has taken a very active part in the advancement of automobilism. Several other events were planned before the rainy season sets in, but it now appears as though the season closed with last Saturday's tragedy.

The California Chauffeurs' Association, of which the dead driver was a member, took charge of the obsequies. There were about fifty automobiles that attended the funeral and went to the grave. The body was carried from the undertaking parlors to its last resting place on a chassis.

### Clean Scores of the Endurance Run.

The races were preceded by an endurance run from San Francisco to the noted seaside resort. Sixteen cars started, of which four touched the several checking stations on the second, making actual perfect scores. These were J. S. Conwell's Tourist, L. E. Washburn's Tourist, A. Piepenberg's White steamer, and J. J. Boree's White steamer. The others who made perfect scores coming within the six-minute limit at San Jose, Gilroy and Del Monte were President R. P. Schwerin, in his Winton; Tony Nichols, in a Franklin; Homer Boushey, in a Pope-Hartford; William James, in an Oldsmobile; C. A. Hawkins, in a White steamer; and J. H. Eagle, in a Studebaker.

Several of these drivers undoubtedly would have been among the four winners had it not been for the fact that the watch of the official timekeeper at Gilroy was an erratic instrument. The officials thereupon decided, under these circumstances, that the records at Gilroy should be expunred. They failed, however, to make allowance for the starting time of the cars from Gilroy to Del Monte, which brought in several of the owners a few seconds late. Those who failed to make perfect scores were S. H. Page, in a Packard; Freemont Older, in a White steamer; B. D. Merchant, in an eight-cylinder Hewitt; A. E. Noreen, in an Elmore; William Wagner, in a White steamer runabout; and Sol J. Levy, in a Matheson.

### CHRISTIE'S RACING DAYS ARE NOT OVER.

Walter Christie says he is not through with automobile racing, even on circular tracks. He anticipates driving again at Pittsburg, October 5, on the same track on Brunot's Island, where he met with his recent mishap. Christie desires to have it known that the promoters of that meet paid him his prize money, and the next meet is under the same management.

W. Gould Brokaw is now the owner of the famous Christie racing car, but its builder is to have the use of it for competition and record attempts.

Christie now holds the world's one-mile circular track record of 52 seconds, made at Minneapolis, September 7, and this mark is not to be confused with Morris Park performances, which are placed in a separate class, owing to the fact that the track is 1.39 miles in circumference.

### GATEWAYS OF THE METROPOLIS.

Automobilists generally, whether dwellers of New York City or only occasional visitors, have usually found it difficult and always confusing to make their way in and out of the city by either the most direct or pleasantest route, and there has been a widespread demand for information of this kind in a concise and convenient form that has only been met by the appearance of the "Metropolitan Automobile Guide." This is a handy book of 382 pages, which in a way may be said to form a sort of key to the "Official Automobile Blue Book," as it gives all the gateways to the metropolis, beside showing their interconnection with the extended routes given in the Blue Book. But it is vastly more than a mere guide for entering the city, as it covers the territory round about New York for a radius of 75 to 100 miles in a manner never before undertaken. There are no less than 74 complete routes given, each one of them outlining a one or two-day round trip and covering in all some 6,737 miles of roads. The routes are illustrated by maps and city diagrams, which are in turn copiously supplemented by much needful information concerning hotel accommodations, garages, repair and supply stations, and the like. Exact mileages are given for every town, together with every turn and landmark of importance along the routes which were all traveled and carefully noted in the course of compiling the volume. The territory covered, in brief, is New York City and its immediate environs, with routes extending to Newburgh, Poughkeepsie and Pawling, on the north; Danbury, Waterbury and Bridgeport, Conn., on the east, including all Long Island routes, as well as to Greenwood Lake, N. Y., the Ramapo Valley, N. J., Morristown and Bernardsville on the west, and with extensions to Princeton, Lakewood and the North Jersey Coast to the south and west. The routes are uniformly laid out in pairs, and any of them may be taken in either direction. Each trip is planned so carefully and concisely that one can easily travel every one of them without stopping to ask questions and by merely setting his odometer to correspond it is possible to pick up the route at any intermediate point.

### DETROIT TO HAVE TWO AUTO SHOWS.

DETROIT, Sept. 30.—As the result of the dissatisfaction arising on the part of the dealers over the plan put in force two years ago to make the agent assume the entire burden of local exhibitions, Detroit is to have two shows this winter. The dealers have considered it only just that the maker should bear some part of the expense, and this fact, coupled with the early date of the Chicago show this year, is responsible for the announcement that the Detroit Automobile Dealers' Association will hold a show of its own at Riverview Park Auditorium in December, shortly after the close of the Chicago event, from which many of the exhibits will be transferred. The second show will be held by the Tri-State Auto and Sportsmen's Association in the Light Guard Armory in February, 1908.

### PALACE EXHIBITORS TO GIVE DEMONSTRATIONS.

Even if the exhibitors at the coming Palace show had agreed among themselves not to give demonstrations during the course of the show, it is probable that circumstances would have proved too strong for them. This because of the fact that the show is to be held in an ideal month for driving and prospective purchasers will, in numerous cases, want to be shown the superiority of the six-cylinder car, of which no less than fifteen different distinctive models, representing as many makers, will be staged. Both the makers and the average autoist are agreed that cars as a rule have reached a point where the demonstration is entirely superfluous, but while admitting the lack of need for a try-out to be convinced, the public still asks for demonstrations, and doubtless will do so to a much greater extent this year, as the conditions will be more favorable.

### AKRON AMERICA'S TIRE-MAKING CENTER.

AKRON, O., Sept. 30.—With the passing of 1907, Akron's claim to be the "City of Tires" will be so strongly established that it cannot be longer disputed. Due almost entirely to the great expansion of the rubber industry here, the city's population has been considerably increased in that time, and the influx of rubber workers bids fair to be maintained, as it is learned from interviews with officers of the various companies whose plants are located here that there is scarcely a tire factory in Akron that is not completing, building or planning enlargements.

By the end of the year, the B. F. Goodrich Company will have added 300 to 400 men to its force. One additional five-story building, now in course of erection to increase its facilities, will house 300 new operatives alone. The company advertises for tire makers constantly, but the supply never seems sufficient.

The Diamond Rubber Company expects to complete a substantial addition to its plant by December 1, meaning an increase of 150 men by that time, the addition to the working force totaling 2,300 men by the end of the year. Consequently, for the present twelvemonth, this company will add no less than 400 men.

The Goodyear Tire & Rubber Company expects to add 150 men to its forces by the end of the year, while the Firestone Tire & Rubber Company will also increase its already large payroll. Though this company only completed an addition to its plant but a short time ago, another and much larger increase in its facilities is already being planned. Another large company which is not ready to announce its plans definitely expects to add a tire department as a new feature, and will employ 100 men. Still another is doubling its capacity and will have 350 men at work when additions are completed.

In announcing its plans for 1908, the Diamond Rubber Company has made it known that it will market a greater variety of types and styles of tires than ever before. In addition to the regulation clincher and quick-detachable clincher in round, flat, non-skid and Bailey treads, Diamond tires will be made in the several types of tread for Fisk rims, and there will also be a Diamond mechanical or Dunlop type in a limited number of sizes. The clincher type will be made in all the American and foreign sizes, that is, both inches and millimeters. The Diamond guarantee for 1908 will cover all of the established makes of quick-detachable rims, which is a departure from the rule adhered to during the present year.

### THE AMERICAN MICHELIN PLANT.

A few months after the announcement that Michelin, the great French tire manufacturer, would produce in the United States, a statement is issued that the firm's American factory is completed and that output will appear almost immediately. During the visit of M. Edouard Michelin, president of the European companies, to this country, a short time ago, purchase was made of the plant, machinery and building of the International A. & V. Tire Company, at Milltown, N. J., and a company incorporated with a capital stock of \$3,000,000. It was decided to use the existing buildings for store houses and offices only, eight new buildings being erected on the plans of the Turin factory in Italy, built in 1906.

Although the contractors only broke ground on June 3, seven of the buildings are completed and stocked with special machinery sent from Europe. A new 2,440 horsepower plant, operating two one-thousand kilowatt turbines, made by Westinghouse, have been installed, and auxiliary power is obtained from a 700 horsepower engine. The products of the American plant will be identical with those of Clermont-Ferrand, France; Turin, Italy; and London, England. Michelin tires will be made in American sizes, quick detachables and clinchers will be produced, and the Michelin dismountable rim, together with the anti-skid used in the great racing events of Europe, will be manufactured in the New Jersey factory. It is intended to establish branches in all the large cities of America, where complete stocks will be carried.

### A LEISURELY AND INTERESTING JAUNT.

With the double purpose of giving the 1908 Pierce-Racine car a thorough testing out, such as not even its native Wisconsin hills could afford, and to collect data for the Chicago Automobile Club, showing not alone the feasibility but the practicability of the average autoist making the same trip with his family and unaided, Sales Manager S. E. Wherritt, accompanied by a party of four and a driver, left Chicago, and two weeks later turned up in New York. The route lay via South Bend, Ind., Toledo, Cleveland, Buffalo and Albany to New York City, and no attempts whatever were made at speed or any other kind of records, the party coming along leisurely, as would the average autoist when on tour. The data compiled includes the gasoline and oil consumption of the engine, distances, roads, hotel accommodations and the like, and was also intended to include the time and nature of the different repairs made, but, according to Mr. Wherritt, who visited the offices of THE AUTOMOBILE while in New York, the trip had been a close approach to the millennium of touring, roads and weather excepted, of course.

"We have never had to stop five minutes for repairs since leaving Chicago, and, as for tires, we didn't even bring a spare one with us. You would hardly believe it possible,

SALES MANAGER WHERRITT AT WHEEL OF PIERCE-RACINE.

but we haven't pumped our tires since starting on the trip, so that blowouts and punctures alike have been unknown. And that's a pretty good record with six people in the car," said Mr. Wherritt, speaking enthusiastically of his successful trip and the excellent performance of the car's Goodyear tires. "There is absolutely no reason why any man with a good car can't take his family and do the same thing," he continued. "There was only one time on the whole trip when we were in danger, and that was at a bad grade crossing on a curve in Ohio. The train could not be seen until one was almost on the track. The return will be via Philadelphia, Atlantic City, Baltimore, Washington, Pittsburg, Columbus and Indianapolis, and in the same leisurely manner.

### AEROCAR COMPANY'S PLANT BID IN.

DETROIT, Sept. 30.—Sold under the hammer to satisfy the claims of creditors, the Aerocar Company's plant brought a trifle more than 50 per cent. of its appraised valuation, which was admittedly about one-half the actual investment. The property, equipment, unfinished cars, patents and all outstanding accounts went for \$96,500, to a local real estate firm. Although the identity of the party or parties back of the deal was carefully concealed, it is understood that A. Y. Malcomson secured the plant. As head of the defunct concern he was heavily involved, and it is said he bid the plant in to protect himself.

OUR STRENUOUS CHIEF EXECUTIVE IN THE WHITE.

### PRESIDENT ROOSEVELT AGAIN TRIES THE AUTO.

As a fitting wind-up to their season of strenuous service at the summer capital, the government's White steamers ended their work at Oyster Bay by conveying the President and his family from Sagamore Hill to the railroad station, quite in contrast to the use of horse equipages in former years. The departure of the chief executive from Oyster Bay is a momentous event in the annals of the town, and the entire population turns out en masse to bid its most distinguished inhabitant a fitting farewell. The president has come to regard the automobile so favorably as the result of the two White steamers which have been an important adjunct to the summer colony, and which have been under his constant observation, that he departed from previous precedent in utilizing them, even going so far as to express his delight with the satisfactory service that the cars had rendered.

### PRELIMINARY TO THE GARDEN SHOW.

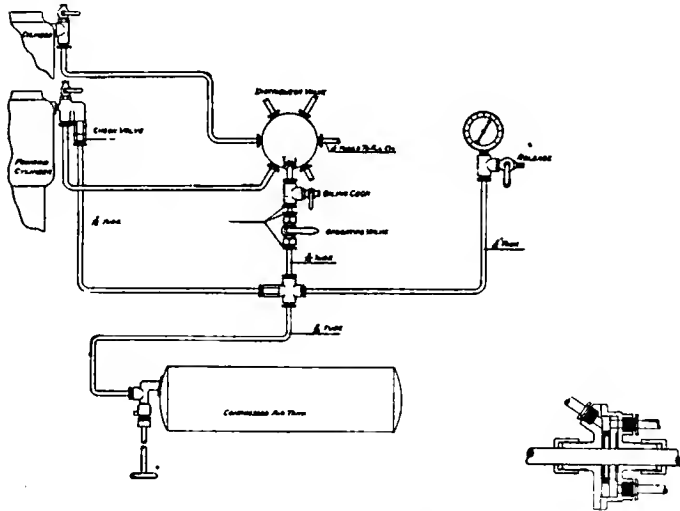

As a kind of opener, or rather an appetizer, the show committee of the Association of Licensed Automobile Manufacturers entertained the Madison Square Garden staff at a banquet at Mouquin's on Sixth avenue last week. Colonel George Pope, chairman of the committee, presided. The speakers included Secretary James Young, of the Madison Square Garden Company; Marcus I. Brock, of the show committee; M. L. Downs, its secretary; T. J. Reynolds, superintendent of the Garden; Antoni Pellegrini, head of the ticket-selling forces; Enos Joseph, in charge of the gatemen; C. N. Schroeder, business manager; M. J. Pike, receiving superintendent; James S. Stewart, electrician; Warner K. Paxon, chief engineer; H. T. Clinton, Arthur N. Jervis and Henry Caldwell, of the A. L. A. M. publicity bureau. Others present were Charles Spect, W. J. Brennan, T. W. Fenn, Fred. Fralick, Thomas Jones, John A. Smith and E. J. Hazard.

MADISON SQUARE GARDEN'S STAFF AS A. L. A. M. GUESTS

**THE WINTON SELF-STARTING DEVICE.**

Complying with the demand for a self-starting device on the modern car, the Winton company has made a compressed air equipment for this purpose a feature of the new Winton "Six-Teen-Six," the apparatus being the result of close study devoted to the problem for some time past. The first cylinder of the six is relied upon to supply the motive power, and only a part of its compression is necessary to maintain the apparatus. This is piped through a check valve to a storage tank located between the driving shaft and the left frame rail under the rear seat. The check valve on the cylinder is spring-controlled and the spring has sufficient pressure to withstand the compression of the fresh charge,

DETAILS OF THE NEW WINTON SELF-STARTING DEVICE.

so that only the spent gases are utilized. To start the motor the valve on the dash, as indicated in the accompanying sketch, is opened. This permits the pressure to flow from the tank to the distributor valve, which is driven by the camshaft and timed so that the entire pressure of the tank is led to the cylinder that is about to fire, each cylinder except No. 1, being equipped with a check valve, to which is attached the usual compression cock. The pressure entering the cylinder that is about to explode forces its piston downward and the charge is fired, compelling the motor to take up its cycle. Should the first cylinder not accomplish this, however, the pressure is then automatically shunted into the cylinder that is next to fire in the regular order and forces its piston past the firing point, having previously compressed whatever charge remained in it by the revolution of the crankshaft and drawn a fresh charge into the third cylinder to fire. The motor will continue to turn over under the pressure of the storage tank automatically distributed through the moving valve, just as if it were operating under its own power. As the capacity of the tank is calculated with a generous factor of safety the motor will turn over for a number of revolutions and cannot fail to start, if in good order. The other components of the system are the pressure gauge, mounted on the dash, to which is attached a release cock; a cock for oiling the distributor valve, the latter being shown in section, in the small sketch at the bottom of the drawing, and the cylinder connections with their check valves. Five-sixteenths inch tubing is employed on the supply side of the apparatus with 1-4 inch tubing from the distributor valve connections.

**AMERICAN ALL CHROME NICKEL STEEL CAR.**

With a view to bringing the selling price of a car designed along the best approved lines and embodying the best of materials, down to a fair level, J. M. Ellsworth, 518-520 West Twenty-second street, New York City, has installed a special plant at this address and will exhibit his first cars at the Grand Central Palace show this month. A larger plant is to be established outside of New York City for the manufacture of cars, while the New York shop will be devoted to the production of replacement parts in alloy steels—a special service of great value to makers, garagemen and owners, which has been developed by Mr. Ellsworth's chief engineer, Thomas J. Fay.

It is claimed by Mr. Fay that parts can be produced in chrome nickel steel at about the same cost as for carbon steel under suitable conditions, and he has under him a skilled staff of machinists who have been trained to this work. Owners of foreign cars can thus have parts of the same materials replaced in a fraction of the time, as well as with a saving in expense.

**ANNOUNCEMENT FROM THE HOL-TAN COMPANY.**

It is definitely known that the Hol-Tan Company, of New York City, will shortly make an important announcement in reference to its future program. While this concern has handled the Fiat car in this country, it is understood that it will have extensive territory in the East for a well-known American make of car. Naturally President C. H. Tangeman and Vice-president Harry Fosdick were much elated at the Fiat victory in the 24-hour Morris Park race, but it is known that for some time they have had plans which embrace the handling of a high-priced American car, even though responsible for the success of the Fiat.

**ADAMS GARAGE AT ROCHESTER BURNED.**

ROCHESTER, Sept. 30.—While William Adams was preparing to take a car out to run to Brockport, where his brother was stranded, the wiring became short-circuited in some manner and set fire to it. The building, situated at 485 Lake avenue, was completely destroyed, together with adjoining property and five cars. In attempting to run the blazing car out of the garage it stuck in the doorway and young Adams was severely burned. Frank Adams, the proprietor of the garage, recently installed \$2,000 worth of machinery, so that this loss will reach \$4,000.

**NEW WINTON SIX-TEEN-SIX ROADSTER.**

It was a foregone conclusion that the builders of the Winton, while announcing their intention of adhering strictly to one type of car for the season of 1908, would bring out a runabout body on the same chassis, and some idea of the result of their efforts in this direction may be obtained from the accompanying illustration of the new car. Except for the body, this newcomer is an exact duplicate of the Winton six-cylinder chassis.

LATEST ADDITION TO THE RANKS OF THE HIGH POWERED, SIX-CYLINDER ROADSTERS.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANEOUS

Many guesses have been hazarded as to the signification of the odd title of the latest Winton, the Six-Teen-Six. Its aptness is to be found in the fact that it is the sixteenth Winton model and has six cylinders.

Heald Machine Company, Worcester, Mass., makers of the Heald ring and cylinder grinders, have just completed two large additions to their plant, 150x90 and 30x45, giving the concern 28,000 square feet floor space.

James M. Sholl, recently appointed receiver for the St. Louis Motor Car Company, Peoria, Ill., has been elected trustee in bankruptcy of the concern and will manage its affairs until finally wound up.

Having tested out the Truffault-Hartford suspension to their entire satisfaction, the Nordyke & Marmon Company, Indianapolis, Ind., have decided to equip their entire output of Marmon cars with these shock-absorbers during 1908.

All rights and patents covering the Rutenber carbureter have recently been acquired by the Western Motor Works, Logansport, Ind. The latter concern is well known as the manufacturer of the Rutenber motors, and will now make the carbureter of the same name as well.

Upon the return of R. E. Olds, president of the Reo Motor Car Company, Lansing, Mich., from abroad, the directors voted every employee in the plant a bonus of 5 per cent. on his annual salary in recognition of faithful service. The gratuity affected 900 people.

The Standard Roller Bearing Company, Philadelphia, Pa., has just increased its capital from \$3,500,000 to \$5,000,000, and large additions are now being made to the plant and equipment for the purpose of enlarging the company's department for the manufacture of roller bearings.

A meeting of the creditors of the defunct Deere-Clark Motor Car Company, of East Moline, Ill., has been called for October 5, and will be held in Rock Island, Ill., at the office of the referee in bankruptcy, Adair Pleasants. The liabilities are \$100,000, and the nominal assets \$125,000.

Due to the recent sale of his personal holdings in the Angier Automobile Supply Company, the Motor Mart, 222 Eliot street, Boston, Mass., by Mr. Angier, the impression has gone abroad that the Angier Company, 735 Boylston street, Boston, and its branch at 9-11 Dorrance street, Providence, R. I., had sold out. Except for certain contract relations still extant, there is no connection between the two companies.

Since the establishment of the American Michelin Company's factory at Milltown, N. J., many visitors have been desirous of going through it, but the same rigid policy which has been adhered to abroad has been adopted here. When on tour the Queen of Italy visited one of the Michelin factories, but neither her rank nor a special telegram to Eduard Michelin at Clermont-Ferrand sufficed to disturb the precedent.

The Warner Instrument Company, Beloit, Wis., has just closed a contract with the Electric and Ordinance Accessories Company, Ltd., Birmingham, England,

one of the largest English companies making electrical instruments of precision, to manufacture the Warner Autometer on a royalty basis. This concern is controlled by Vickers Sons & Maxim, and is said to have the finest equipment of automatic machinery in Great Britain. It was about to undertake the manufacture of a centrifugal type of instrument, but abandoned it in favor of the magnetic principle of the Warner, and will popularize the latter on the other side.

Through the efforts of the Premier Motor Manufacturing Company and the Gibson Automobile Company, the children of the Indianapolis orphan asylums were treated to their annual automobile outing last week. There were twenty-one Premier cars in line, including some loaned for the occasion by private owners, and they accommodated seventy-six of the youngsters, many of whom were then given their first view of Indianapolis outside the asylum walls. The procession started west on Washington street, continuing out the beautiful Capitol avenue boulevard, and across to Riverside Park, where the children were given an opportunity to enjoy themselves. Some of the children would have put A. A. tourists to shame for real dust on the completion of their enjoyable trip.

### NEW AGENCIES ESTABLISHED.

The Automobile Sales Corporation of New York, 1661 Broadway, has just taken the distributing agency for the Panhard oils, Comstock shock absorber and the Webster gasoline gauge.

The Puritan acetylene gas tanks, made by the Old Colony Light Company, Boston, Mass., will be represented hereafter in New York State, New Jersey and Connecticut by the Pierson Motor Supply Company, of New York and Brooklyn.

Smith Brothers, Los Angeles, Cal., have been appointed agents for the Rainier cars for the Southern California territory, the contract having recently been closed by General Western Sales Manager Ezra E. Kirk, while in Los Angeles on a trip through the coast territory.

The H. H. Franklin Company, Syracuse, N. Y., now has five branch houses, three of which—Boston, Chicago and New York—have been opened during the past year. The New York branch, at Broadway and Seventy-third street, is in charge of Winfield S. Jewell, assisted by C. E. Apgar as salesman. A separate building has been leased at 211 West Eighty-seventh street and a complete repair shop installed.

The Warner Instrument Company, Beloit, Wis., has found it necessary to open independent branch offices in Michigan and Ohio in order to properly handle its autometer business in those States. O. C. Foster, who formerly covered this territory, has been assigned to Ohio, with headquarters at Cleveland, while George G. Weidner, one of the western representatives, will cover Michigan, his headquarters remaining at the old stand at 260 Jefferson avenue, Detroit.

R. M. Owen & Company have just completed negotiations for the handling of the Reo and Premier lines in Chicago, formerly taken care of by a branch house, with the Walden W. Shaw Com-

pany. The latter concern now has in process of erection a large modern building at the corner of Twenty-second street and Michigan avenue, and in addition to the Reo and Premier lines will still continue as western distributors of the Berliet. Mr. Herz, who has been identified with the Electric Vehicle Company for several years past, has become connected with the new Chicago agency.

The Oto Sales Company, manufacturers' agents, 2923 Olive street, St. Louis, has been formed by T. K. Shannon, formerly of the Behen-Faught Company, of that city, and Charles E. Halliwell, formerly St. Louis representative of the Warner autometer. Mr. Shannon is president and general manager and Mr. Halliwell is vice-president and secretary. The new company expects to conduct a manufacturers' agency of the first class, carrying no two lines that will conflict with each other, and will protect the firms with whom it does business in every way possible against losses.

### PERSONAL TRADE MENTION.

Charles G. McCutcheon has just been elected vice-president of the American Distributing Company, Cleveland, O., and beginning October 1 will devote his attention to the selling end, probably taking the East as his territory.

Fred Titus, of cycle racing fame, who has acted as sales manager of the Harry S. Hought Company, New York, agents for the Thomas cars, has just been appointed manager of the New Jersey branch recently opened by that firm in Newark.

Carl Page, for a number of years identified with the White interests in New York City, has taken the New Jersey and Connecticut agencies for the Peerless cars. At present Mr. Page is engaged in remodeling the selling forces of R. M. Owen & Company, agents for the Reo and Premier lines.

George H. Strout, sales manager of Apperson Brothers, Kokomo, Ind., left for a trip to the Pacific Coast on October 1 which will keep him in the far west for the next three weeks, during which time he will close arrangements now pending for the handling of the Apperson car in Los Angeles, San Francisco, Portland, Ore., Salt Lake City, Utah, and Seattle, Wash.

An addition to the executive officers of the E. R. Thomas Motor Company, Buffalo, N. Y., has just been made by the appointment of R. B. Jackson as general manager. Mr. Jackson received his technical training under some of the best known engineers in the country, and for the past few years has been associated as factory manager with some of the country's largest auto manufacturers.

Frank C. Riggs, up to a short time ago vice-president of the Fisk Rubber Company, Chicopee Falls, Mass., has joined the forces of the Packard Motor Car Company, Detroit, Mich., and took charge of the commercial vehicle and enclosed body departments on October 1. The company has been experimenting constantly for the past two years with motor trucks, and will now begin an active commercial vehicle campaign, the first cars being ready within the next few months.

**INFORMATION FOR AUTO USERS.**

**Common-Sense Auto Fronts.**—Under this title Colonel Sprague, of automobile top fame, otherwise the Sprague Umbrella Company, Newark, O., has recently brought out a glass front of unique design. That it is a Sprague idea and

SPRAGUE'S NEW COMMON SENSE AUTO FRONT.

works in the Sprague way will probably be sufficient description for the many who are acquainted with the products of this firm in other lines. It is made of the best French plate glass, split horizontally in the center and enclosed in a neat and substantial brass frame, its chief feature of interest, however, lying in the simplicity and ease with which it may be manipulated. It locks in place by a simple and efficient device, and does not fold upside down as is usually the case. Instead of being hinged and folding over, it is only necessary to move the upper half of the frame to the right a short distance, after unlocking, and it drops into place, folded; while replacing it entails merely a reversal of this operation. It is simplicity itself, and cannot rattle in either position, while the quality of the material and workmanship employed insure its durability. It will make its debut at the coming Palace and Garden shows in New York this fall.

**Security Apparel Holder.**—As an addition to its line of automobile specialties, the Imperial Brass Manufacturing Company, 241-249 South Jefferson street, Chicago, has recently brought out a device termed the Security Robe and Ap-

SECURITY APPAREL HOLDER IN PLACE.

parel Holder, designed to be attached to the rear panel of the front seats of the car for the convenient accommodation of robes, overcoats and the like, which are otherwise always in the way and encumber the tonneau. The holder consists of a horizontal collapsible frame work, to the outer rods of which is fastened the bag or receptacle. The side toggle arms of the framework are pivoted, and are fitted with lugs having elongated holes or slides in them. When opening, the mouth of the bag is swung to its full telescopic adjustment, and, the lugs on the toggle arms becoming engaged, bring

the center rod to a level with the opening of the bag. The frame is then pushed slightly backward, the lips on the toggle arms become engaged with the lugs of the main brackets by which the device is attached to the car, and the receptacle is thus rigidly held open, permitting the proper arrangement of its contents on the center rod. To close, the frame is pulled forward slightly, disengaging the lugs, and the mouth collapses, permitting the bag to close regardless of the amount of its contents, either operation naturally taking but a fraction of the time necessary to describe it. The metal work is of handsome design, highly finished, and includes a pair of grasp handles, one at each end.

**Die-Cast Bearings.**—Within the past few years the antiquated method of pouring babbitt or other alloy bearings has been superseded to a very large extent by the employment of special die-

SPECIMENS OF AMERICAN DIE CASTINGS.

cast bearings possessing many advantages. The system has been developed very largely by the American Die Castings Company, 815 South Delaware street, Indianapolis, Ind., the successful production of this class of bearings by

this method being the result of a special process. The many claims of such bearings to superiority over the old forms will be obvious. They may be die-cast of all bearing metals accurate to .001 inch, are smooth and true, as if machine finished, and have the great advantage not only of being absolutely uniform mechanically, but the makers also guarantee them to always contain the same percentage of alloy as the metal furnished. The process is applicable to every form of plain bearing, whether of a simple or intricate nature, and the makers will furnish estimates on any class of work of this kind.

**Rutenber Motors.**—Under the title of Rutenber, Model U, the Western Motor Works, Logansport, Ind., has just placed on the market a new 40-horsepower model for 1908, which embodies numerous features of merit. The cylinders are cast separately, and their dimensions are 4 3/4-inch bore by 5-inch stroke, the motor developing its rated output at the moderate normal speed of 1,000 r.p.m., while its speed range is from about 150 to 1,500 r.p.m., developing an excellent torque at low speeds, which is a quality sought for in the up-to-date automobile motor. The valves are mechanically operated and are all placed on the same side, while the pump and timer are placed at the forward end of the motor, the former being located on a vertical standard and having all its moving parts securely encased, as is true of all the gearing. Quite a departure has been made in the magneto drive, which is taken directly from the crankshaft through spiral gears, instead of from the camshaft or an independent special shaft solely for this purpose, as is usually the case, thus eliminating this complication. Particular attention has been paid to the design of the valve-operating mechanism, and tests have shown it to be highly effective. With this addition the Rutenber line now includes motors ranging from 30 to 60 horsepower, three sizes being made in the four-cylinder type, 4 1-2 x 5; 4 3-4 x 5 and 5 x 5 inches bore and stroke, and 4 1-2 x 5 in the six-cylinder type. The plant of the Western Motor Company is now one of the largest in the country devoted exclusively to the manufacture of motors, every part entering into their construction being made in the firm's own factory. Its capacity has been largely increased during the past year or two in order to keep pace with the demand for Rutenber motors.

NEW SIX-CYLINDER 40-HORSEPOWER RUTENBER MOTOR, MODEL U.

# THE AUTOMOBILE

VOL. XVII.

NEW YORK—THURSDAY, OCTOBER 10, 1907—CHICAGO

No. 15

DESIRING to learn of a country in which automobiling could be done in winter under enjoyable conditions, I made inquiries in New York and Paris at all the usual sources of information, and was told that in the French colonies of Algeria and Tunis I would find what I sought. The only information obtainable was that the roads were good, the climatic conditions favorable, and automobilists were going to Northern Africa in increasing numbers. Neither in New York nor Paris could be obtained that specific information that is so much desired by automobilists proposing to enter a new field, and it was found later that in Algiers itself such information of a trustworthy character is extremely difficult to procure.

From books very little can be learned that is of any use at all to automobilists. "Murray's Guide to Algeria and Tunis" is out of print and not obtainable; a new edition is promised for next Fall. Miss Cronnse's "Algiers" is of no practical value at all. "Cook's Practical Guide to Algeria and Tunis" contains a great deal of information that is helpful and interesting to the ordinary sightseeing tourist. "Reynolds-Ball's Mediterranean Winter Resorts" tells about all one wants to know concerning climatic and health conditions, though it is apt to mislead those who have not already acquired some definite idea as to the North African climate. And the "Guide Joanne" (in French) to *Algérie et Tunisie* is the best of all, because its general information as to hotels and places of interest is ample, well arranged and up-to-date (last edition 1906). Some helpful data were found in the last pages of the "Guide Routier Continental" for 1906, but the figures as to distances, etc., contained therein appear to be based on guesswork and not on exact knowledge. For automobilists the most helpful information is still to be found in an article written by Cortlandt F. Bishop.

It is to furnish readers of THE AUTOMOBILE with up-to-date and trustworthy information that this article and two others that

are to follow it are written. I wish to state with emphasis at the outset that they are not intended to be a substitute for or even a supplement to the descriptive guide books. Their sole aim is to give such definite, specific and practical facts as will enable automobilists to determine, in the first place, whether or not they care to take their cars to Algeria and Tunis; and, in the second place, to avoid those difficulties and annoyances that are likely to result from ignorance of existing conditions.

#### A Winter Run from Paris to the Mediterranean.

On Friday, March 8, at 5:40 P.M., we ("we" consisting of self and chauffeur) made our exit from Paris. Our purpose was to catch the Monday boat from Marseilles to Algiers, to accomplish which it was necessary to reach Marseilles Sunday night. We had estimated that, in the absence of disabling accidents and with reasonably favorable conditions, we could do this by leaving Paris not later than 2 P.M. on Friday, staying at Avallon the first night and at Lyons the second night. Although our departure was some three and a half hours later than this, we hoped, with good luck, to make the journey within the limit of time. Our car was a 24-horsepower Panhard (model 1906), with demi-limousine body and weighing in all 4,168 pounds—the pertinence of these details will become evident further on. It had been sent to the Panhard repair shops for a thorough overhauling, but it had not been "tried out" or "tuned up," and all the way down to Marseilles we were delayed at intervals by the necessity of making adjustments of the mechanism which the layman cannot help fancying should be made in the repair shop, but which for some inscrutable reasons never are.

It was partly owing to these delays that we made only half the distance to Avallon the first night, passed through Lyons on the afternoon of Sunday, and did not reach Marseilles (499 miles) until 6:30 P.M. Monday—too late for the steamer. But

it was chiefly due to the condition of the roads. Beyond doubt the roads of France are the best in the world, but after the winter's wear and before the spring repairs are made their condition is such as to render high speed impossible for long distances, especially when, as in our case, a streaming rain accentuates all the bad places. It will be well for automobilists to bear this in mind when they plan to anticipate the usual season for autoing. Another fact that may interest them is that in winter and early spring the cost of gasoline (called "essence" in France and her colonies) is from 20 to 25 per cent. higher than in summer. At Villeneuve-St. George, where most of the automobilists leaving or entering Paris by the great southern route fill up their reservoirs, and where the regular summer price of gasoline is 28 centimes per liter (about 22 cents a gallon), we had to pay 40 centimes; and at Chalons, at Macon and at Avignon, where the usual summer price is 35 centimes a liter, we had to pay 45 centimes.

On the trip from Paris to Marseilles, 225 liters of gasoline were consumed, at an average cost of 42 1-2 centimes per liter. The cost per kilometer (a kilometer is five-eighths of a mile; the term will usually be used in these articles, partly for convenience and partly because automobilists in Europe and Africa must accustom themselves to this measurement of distance, the mile being unknown) was almost exactly 12 centimes, as compared with an average of 10 centimes per kilometer in France and Germany during the summer of 1906 with the same car. The average consumption was one liter to three and a half kilometers (about a gallon to nine miles), as compared with one liter to four and a fourth kilometers (about a gallon to eleven miles) in 1906; the latter figures showing the difference in the condition of the roads, the car presumably being equally efficient on both occasions.

Shortly before noon of Wednesday, March 13, the machine having in the meantime been again thoroughly overhauled in a Marseilles repair shop, our car was hoisted by ship's winch to the deck of the steamer *Maréchal-Bugeaud* of the Compagnie Générale Transatlantique line, securely fastened and covered with a tarpaulin. At 1 P.M. the steamer sailed, and at 3:30 P.M. the next day we arrived at Algiers and the car was landed the same afternoon. The requirement of a certificate from the customs authorities caused some delay, but next morning the car was available for use, having been embarked and disembarked with no damage except a few scratches of the paint. The cost of transportation, including the embarkation fee at Marseilles and the fee at Algiers, was 192 francs 50c. (\$38.50).

#### First Impressions of Sunny Africa Were Chilling.

In Paris the weather was as cold as in New York, and in Marseilles it was colder than in Paris. As we approached the coast of Africa, long before Algiers itself came into view, we were surprised to see the majestic rampart of mountains a little back from the coast snow-clad a third of the way down from their summits. The effect of this was evident in Algiers when we landed, the men being overcoated and the women wearing furs, precisely as in Paris. At the hotel, wood fires hardly sufficed to take the chill off the bedrooms, and the sitting rooms and dining room were heated just as they would have been in New York. The thin clothing we had expected to don as soon as we landed was left in the trunks, and the writer's travel party, which had preceded him by steamer, was found at the hotel, shivering and disgruntled, anathematizing Algiers and its climate and counting the hours until we could leave for Biskra and the genial warmth of the desert. Of course, we were assured that the weather was "unseasonable" and that "such

STREET SCENE IN SIDI OKBA.

a winter had never been known before."

Algiers as a city has been too often described for it to be worth while to detail it again here, even if description were the purpose of these articles. It is beautifully situated, climbing from the harbor up the side of a steep hill, backed by mountains, and overlooking a lovely bay. From the high-lying suburb of Mustapha the views are entrancing, and seen in the distance from either sea or shore its white radiance dazzles in the sunshine. But anyone who goes to Algiers expecting to find an Oriental city will be disappointed. Viewed from afar or inspected close at hand, it is a distinctly French city with many European counterparts. Arabs in the streets, in white burnouses and headdresses, add a touch of picturesqueness, and there are an Arab quarter and a few native mosques and other buildings that are worth visiting; but the dominant note is altogether European.

In the streets of Algiers one sees almost as many automobiles as in any French provincial city of similar size, but most of them are obviously for city use only. The leading hotels manage to house automobiles in some fashion; there are in the city four good garages, with two more approaching completion; three agencies for the sale of automobiles, and some four or five shops at which tires and other accessories are kept in stock. Gasoline is readily obtained, the price being uniformly 2 francs 50c. for a five-liter *bidon* (about 40 cents a gallon).

#### Off for the Warmth of the Sahara.

From Algiers three or four excursions may be made with comfort by automobile over good roads. Perhaps the most enjoyable of these is to Medea via Blidah. This involves a climb up to the great plateau which lies between the minor Atlas range that borders the coast and the major Atlas mountains that confront the Desert of Sahara from Morocco to Tripoli. Blidah (31 miles) is the center of an extensive orange-growing region, and Medea (60 miles) of the best wine-making district of North Africa. More interesting than either town is the Gorge of the Chiffa, which lies about nine miles beyond Blidah; and from Blidah the famous baths of Hammam R'hira, where is an extensive thermal establishment, may be visited—they are about fifty miles distant. Another excursion is to Cherchel, on the seacoast, about seventy-three miles from Algiers, over a road that during the latter part of the journey hugs closely the shore of the Mediterranean. It was the ancient Caesarea of the Romans, a capital of Mauritania, and offers to the tourist some interesting Roman ruins. One of the grand national routes leads westward from Algiers to Oran 461 kilometers (about 300 miles), but it traverses an uninteresting country and in places the road is said to be very bad.

We made none of these excursions, partly because they did not solicit us very strongly, but chiefly because of our desire to get as quickly as possible to the warmth of the Sahara. It was intimated to us at Cook's, and by the secretary of the local automobile club, that we might encounter snow in going over the mountains to Bougie, but here as elsewhere the information obtainable as to routes and conditions was very indefinite, and we had only the vaguest idea of what lay ahead of us.

We left Algiers, a party of five, at 9 A.M. on Saturday, March 16. As far as Azazga (135 kilometers) the road, bad in places but fairly good as a whole, traversed a level country without a single interesting feature except the backward view of Algiers. The cultivated fields were green with wheat from three to six inches high, and occasional almond trees showed their pink blooms. The only tree that is at all numerous is the eucalyptus, which is popular because of its quick growth and its ability to send its roots down to incredible depths in search of moisture.

At Tizi Ouzon (100 kilometers) we stopped for lunch, and the proprietor of the Hotel Lagarde confirmed our information that we should encounter snow in crossing the mountains. Here the gasoline tank must be filled, as no fuel can be obtained before reaching Bougie, 160 kilometers away by a mountainous road. The charge was 2 francs 75c. for the *bidon* of 5 liters (at the rate of 44 cents a gallon).

At Tizi Ouzon the fact was brought home to us for the first time that we were in an Oriental land. A native market was being held, the town swarmed with Arabs and Kabyles, and for ten kilometers the road was thronged with a motley crowd returning home astride of donkeys about as large as Newfoundland dogs, or driving sheep, goats and the diminutive cattle of the country. At Tamda (115 kilometers) the first camel was seen.

#### A Wild Ride Across Snow-clad Mountains.

At the small village of Azazga the foothills of the Atlas are reached, and a climb begins that is almost uninterrupted for 45 kilometers. At first the road winds up through the vast cork forests of Kebouch, which are a source of large revenue to the French Government, but soon all vegetation is left below and then the route ascends an apparently endless succession of bare, desolate and stony steeps. It is a lonely land, bleak and forbidding of aspect, with no signs of human habitation except here and there, at infrequent intervals, a Kabyle village of stone or mud huts nestling on the precipitous declivity of a distant hill. Between Azazga and El Kseur, at the foot of the mountains on the other side, a distance of about 110 kilometers, no food or supplies, no help of any kind, could be obtained in case of accident or delay; and the road is such that it would be in the highest degree dangerous to attempt to travel any portion of it at night. For this reason it would be more prudent for automobilists, especially those with heavy cars, to leave Algiers in the afternoon, spend the night at Tizi Ouzon, and give themselves the whole day for the journey across the mountains to Bougie. This should certainly be done when the trip is made earlier than the end of March. For a distance of ten kilometers on either side of the summit, March 16, we drove through snow which lay on the road from three inches to a foot in depth; long stretches of the road were soft and spongy; there were places where the roadbed had been washed out and hastily repaired with broken stone; other places where precipices yawned on one side while steep cliffs towered on the other.

For many reasons the climb from Azazga is one to be remembered; not the least being the impressive scenery. The descent to El Kseur is less steep and over a better road, the latter part through another extensive cork forest, whose foliage resembles that of our live oaks at home. El Kseur was reached just at dusk, and then a quick run of 26 kilometers over a level road brought us to Bougie, where we arrived at 8:10 P.M. and found comfortable if not luxurious quarters at the Hotel d'Orient.

Looking out of our windows next morning the beautiful situation of Bougie was revealed to us. It lies at the head of a deep bay, in an amphitheater of enclosing mountains, directly under the Gourara. Anciently, under the Carthaginians, the Romans and the Vandals, it was a flourishing commercial seaport, and under the Barbères in the eleventh century it had 20,000 houses and over 100,000 inhabitants. When the Turks captured it in the sixteenth century decay set in, and it is now a rather dingy town of 14,000 inhabitants.

After filling the gasoline tank at a cost of 2 francs 75c. for the *bidon* of 5 liters, we left Bougie at 9:20 A.M., March 17, skirted the seashore across a level plain for 22 kilometers, and then climbed steeply

around the face of Cap Aokas, with exquisite views seaward, reminding one of the road from Sorrento to Amalfi in Italy. At kilometer post 34 the road to Sétif (which we followed) turns off directly south. The continuance of the Cap Aokas road eastward skirts the seashore amid magnificent scenery, winding along the front of steep cliffs and passing through tunnels, with the surf beating over the roadway in places, and ends at Djidjelli, the Ingilgitis of Roman times.

Turning south at kilometer post 34 we ascended a swift-flowing stream which, in its descent to the sea from the high tableland, breaks through the coast range of mountains, forming the Gorge of Chabet-el-Akra. The gorge begins about kilometer post 40 (from Bougie) and ends at kilometer post 58. For the greater part of the distance it is disappointing, but the last eight kilometers are a stupendous cliff-enclosed ravine, with a tormented torrent rushing and foaming at the bottom, and the road hewn at tremendous cost along the frowning face of overhanging precipices.

At the upper end of the gorge is the small Kabyle town of Kerrata. From this point the road ascends in long windings, by easy grades, through a desolate, treeless and sparsely inhabited country, to the summit of the coast range (3,800 feet above the sea), and then makes an almost imperceptible descent of 400 feet to Sétif, 112 kilometers from Bougie.

The road through the gorge of Chabet-el-Akra, ordinarily a good one, was in places almost impassable. Deluging rains had swept sections of it into the swollen stream, and these gaps were being repaired with broken stone shoveled in and left loose and uncovered, threatening to cut the tires at every revolution of the wheels. Near the summit of the pass we again passed through snow-fields, and on many of the hill-slopes the roadbed was so soft as to make very heavy going. At Sétif we learned—what ought to have been told us at Algiers—that there is another comparatively level road from Algiers, which, though far less attractive scenically, is at this season of the year much safer for automobilists.

#### Over the Plateau to El Kantara.

We arrived at Sétif at 1:40 P.M. and found fair, if somewhat frigid, accommodations at the Hotel de France. Here we were told that a road directly across the level plateau to El Kantara had recently been made practicable, and as it would save the long detour and climb to Constantine we decided to try it. The distance as given us was 150 kilometers (it proved to be 173), but as the actual state of the road was unknown and as there are no towns en route at which supplies of any kind can be obtained, we deemed it best to remain at Sétif over night and make an early start next morning. The gasoline reservoir was filled at a cost of 3 francs for the *bidon* of 5 liters (about 48 cents a gallon), and we started at 7:25 A.M. on March 18.

Sétif, anciently the Roman Sitifis, lies almost in the center of the high plateau of the Tel, which has already been described as extending east and west between the two ranges of the Atlas mountains. It is surrounded by a fortified wall, has a military quarter with barracks for 3,000 troops, and its native population of about 11,000 is about equally divided between Arabs and Kabyles.

The road from Sétif to El Kantara traverses the plateau of the Tel in a southeasterly direction and was described to us as very good. As a matter of fact, it was fairly good for carriages or wagons, but for automobiles it has too many ruts and inequalities that try springs and make rapid going impossible. One shoe and two inner tubes were our tribute to it. The country traversed is fertile when irrigated, but sparsely settled, with only a few small

A TYPICAL ALGERIAN SHEIK.

villages along the line of the road. As there is no other source from which the information can be obtained, it may be useful to give our schedule of such places: Sétif; Mestong, 14 kilometers; Ampere, 50; N'Gaous, 87; MacMahon, 148; El Kantara, 173. At MacMahon our road merged into the national route from Constantine, and about eight kilometers from El Kantara a swift descent is made from the high central plateau to the level of the Desert of Sahara.

The Gorge of El Kantara (El Kantara means "The Bridge") has been famous since Roman times and has been more written about, perhaps, than any other spot in Algeria. What is most striking about it is that on emerging from its southern end the green oasis of El Kantara, with 90,000 palm trees, bursts upon the view, while away to the south stretches the arid level of the limitless desert.

Just at the northern entrance of the gorge is situated the small Hotel Bertrand. It is generally full, and persons desiring to stop there over night will do well to write or telegraph in advance. We reached it at 4 P.M., and as no rooms were to be had decided to go on to Biskra, after buying 30 liters of gasoline at 3 francs 75c. the *bidon* (about 60 cents a gallon).

#### Colonial Government Has a Thought for Desert Road.

The road across the desert to Biskra (58 kilometers) is on the whole much better than we had expected, or rather feared. In parts it is simply a camel's track. A small portion of it is over bare rocks where it seems impossible at first glance that any wheeled vehicle, much less a heavy automobile, should make headway; and there are ravines to cross which look as if no automobile could either get down into or climb out of them. The French Colonial Government is building a national highway between the two places, which is now finished for about half the total distance; and the finished portions are as good as any road in Algeria. In about two years, when this road is completed, the journey by automobile from El Kantara to Biskra will be one of the most novel and enjoyable in the world, for even under existing conditions it has a weird fascination. The desert surface is rather stony than sandy; there is a total absence of vegetation; it is a land with a face but no features; and one seems to be chasing the horizon into distances filled with mystery. As we surmounted one obstacle after another, the oncoming of sunset spread over the desert and the distant hills (for there are still hills) a wonderful canopy of color. Biskra, though we knew it must be near, was not visible until after a very steep climb over the last range of desolate hills through the pass of the Col de Sfa. From its summit we saw in the distance an oasis of vivid green that seemed to spread over half the space ahead of us (it contains 250,000 palm trees); above the green rose a white minaret and a tower; and far beyond to the south, unbroken as a sea horizon, stretched the level line of the real Desert of Sahara.

#### "The Queen of the Desert."

Thus the Arabs name Biskra, the capital and commercial emporium of the Desert of Sahara. Here the great caravan routes from the south converge; here ends the railroad that links the desert with the outside world; and here is the center of the French political administration. France's military outpost in this direction has been moved down to Touggourt, but Biskra is still the guardian and center of the Algerian Sahara. Being a fortified town with a garrison, the uniforms of the different classes of French troops, including that of the gorgeous native *Spahi* cavalry, are frequently seen on the streets. But the dominant note of Biskra, even in the European quarter, is not military or even European, but native. Here the native life is seen to better advantage than in any other easily accessible town of Algeria or Tunis. The Arabs are most numerous, but one may also see in considerable numbers Berbères, Bedouins, Bishriens, Touregs, coal black negroes, and Jews, with a few Turks. The Ouled Nails, who have a quarter to themselves and

whose dancing in the Moorish cafés is one of the sightseeing attractions of Biskra, belong to a tribe whose habitation is in one of the remote southern oases, to which they return after they have accumulated the requisite fortune in tawdry jewelry and strings of coins. The life they have led in Biskra and other garrison towns is no bar to their marriage subsequently among their own people; in fact, they are much sought after for the "dowries" they can bring, and are said, like the Japanese Geisha girls, to make good wives and mothers.

The Royal Hotel is a first-class establishment, built in the Moorish style, with a tropical garden in an interior court and surmounted by a tower from which a memorable view may be obtained, especially at sunset. There are four or five other hotels that may be described as good, and a number of lodging houses. All are apt to be crowded during the season from December to the end of March, and intending visitors should be careful to engage rooms well in advance of arrival.

#### An Enchanted Garden in a Desert Town.

Several small parks and gardens beautify the European quarters at Biskra, but the great show place is the Villa Benevent, which has been made famous by Robert Hichens' novel, "The Garden of Allah." No matter what expectations may have been formed of this wonderful garden, the reality is sure to surpass them. Situated on the edge of the oasis, directly on the bank of the stony river bed of the Oued Biskra, across which one looks to the arid expanse of the desert, it furnishes perhaps the most marvelous existing illustration of the wonder-working power of water upon the most inhospitable soil and of the teeming opulence of nature. Crowded with palms of every known variety; containing fine specimens of every tree and plant that will flourish in the tropics; challenging the eye with a color scheme that ranges from cool and restful greens through all the vivid tints of flowers and climbing vines, and soothing the ear with the ever-present murmur of running water; kept in immaculate cleanliness and order by a small army of gardeners; inviting to repose here in dense shade and there amid scintillating sunbeams sifted down through the canopy of foliage; and surrounded on every side by a wall or hedge that gives a sense of isolation and remoteness, it is the embodiment of a poet's or painter's dream of an earthly paradise. Created and now owned by Count Landon, a wealthy French nobleman, it is accessible to the visitor on payment of a small fee that places all the attractions of the garden at his disposal for a whole day or such part thereof as he can devote to it.

#### In the Vicinity of Biskra.

Two short excursions may be made by automobile from Biskra. One is to the Fontaine Chaude (Hot Springs), lying five miles away in a particularly solitary and jackal-infested part of the desert. We burst one shoe and two inner tubes in making this short trip, which renders any description of the road unnecessary. The other excursion is to Sidi Okba, a typical native town of 8,000 inhabitants, situated in an oasis twelve miles from Biskra, and noted for its mosque, which is thought to be the oldest Mohammedan building in Africa and which houses the tomb and shrine of the famous saint and conqueror, Sidi Okba, who in the Seventh century brought all Northern Africa, from Egypt to Tangier, under the rule of the Khalif.

Touggourt, the last outpost of France in the Desert of Sahara, 212 kilometers (about 132 miles) south of Biskra, in an oasis of 150,000 palm trees, has been reached by two or three autoists out of a dozen or so who have made the attempt. The road is little more than a caravan route, barely practicable at best and extremely bad in places. It would be useless for a heavy car to essay the trip. Gasoline and all other supplies for the trip there and back must be carried from Biskra, and for the benefit of automobilists it may be mentioned that at Biskra the price of gasoline is 5 francs for the *bidon* of 5 liters (about 80 cents a gallon).

AN ENGLISH VILLAGE: CRAWLEY, A PICTURESQUE HALT ON THE ROAD TO BRIGHTON.

LONDON, Oct. 1.—Another fuel test is announced by S. F. Edge to be run under the control of the Royal Automobile Club. It will be remembered that a few weeks ago Edge made comparative tests of the best grade of gasoline and a marketed product known as benzol. This week he will undertake a test of benzol only, a British fuel with a specific gravity of .880, and which is sold retail at about twenty-four cents per gallon. The trial will be a three-thousand-mile run over the Great North road, with a view to obtaining reliable data as to the effect of this fuel on the engine.

The recent tire pressure tests on the Brooklands track indicated that the air pressure in a tire made practically no difference to the speed of the car. Experiments were made with tires of 100 and 120 millimeters and with pressure varying from 35 to 100 pounds, without the speed of the car being affected. To get the maximum wear out of a tire it is necessary to use a pressure which sacrifices much of the comfort of riding. The Brooklands experiments, by proving that no speed is lost by low pressures, indicate that there would be an all-round advantage in the production of a tire capable of long use on a lower pressure than at present necessary.

#### Lessons from Britain's Commercial Tour.

BIRMINGHAM, ENG., Oct. 1.—Although the army of commercial vehicles united in the Royal Automobile Club's trials has been on the road eight days, it is too early to make any close deductions as to their mechanical ability or the ultimate results of the demonstration.

A certain number of enthusiastic salesmen appear to be disappointed that orders have not flowed in all along the line, forgetting that heads of business houses do not visit commercial motor exhibitions with a check book in their hands. Manufacturers in the western district, comprising such towns as Bristol, Chippenham, Worcester and Gloucester, are somewhat conservative and are not likely to change their methods of haulage before receiving full proof of the value of the new vehicles. Even Birmingham, important as it is commercially, is not a very good field for the sale of commercial automobiles and probably not until Liverpool, Manchester, Sheffield, Leeds and the smaller industrial towns of Lancashire and Yorkshire have been visited will any real business be done. It is to be regretted that the tour does not extend further north, for there is an interesting field to be exploited in the coal, iron and shipbuild-

ing centers of Durham and Northumberland.

The first public exhibition was arranged at the Old Avonside Engine Works at Bristol, a most difficult place to enter, the gateway leaving but a few inches leeway for many of the vehicles and the ground being so soft that the heavier trucks sank to their axles. Fortunately at the last moment Secretary Orde was able to arrange for the use of the spacious open-air cattle market, a perfect place for a public exhibition. It was not long before those having struggled into the old quarters backed out and invaded the new camp. One dollar per vehicle for two nights was not an excessive charge for good lodging. All the vehicles belonging to one firm are grouped together in the exhibition ground, thus giving an opportunity for an attractive business display. At Birmingham

the depot is the Aston Villa football ground, with city headquarters at an hotel adjoining the London and North Western railroad station.

At the last moment five vehicles found themselves unable to take part in the competition, bringing the number of actual starters down to 55. The two Fiat five-ton trucks did not arrive in England in time; the Wolseley-Siddeley ran off the road in the dark and rain when proceeding to the starting point and was damaged; the Turgan light delivery van was found to be geared too high for the hills and went out on the second day; and the Atkey-Gimson withdrew owing to a defect discovered in the center-bearing of the gear box. There have been probably more mechanical defects than were expected, some of the best known firms being victims of breakdowns, as much to their own surprise as to that of the public. In several cases the managers of important companies, traveling on their own vehicles, have had a first experience of the cussedness of an automobile when put on the road without a preliminary tuning up. One of the 16-horsepower Darracqs was in danger of withdrawal owing to the fracture of a cylinder wall, but by reason of the prompt dispatch of a new casting from Paris—four cylinders in one piece—it was able to continue with the loss of two stages.

As the result of a collision with a steam tractor, a Durham-Churchill was in danger of retirement. After a delay of twenty-three hours, a non-stop run of 105 miles was made over the regulation route, and the main body was caught up, the driver and mechanic remaining on duty thirty-five hours without rest. Bad luck befell a one-ton Milnes-Daimler owing to the frequent bursting of the 36 by 6 inch steel-studded tires. Fixing these tires was a labor of several hours, and after two blowouts, in the first of which two men were injured, and in the second the rim was damaged, it was decided to withdraw the vehicle. There are three or four accidents to report, none of them, however, of a serious nature. At Birmingham a trolley car ran into the Dennis lorry, damaging the rear; a Maudsley slipped into a ditch near Alcester, but was brought out under its own power; the three-ton De Dion gave trouble on the hills and had to be temporarily withdrawn for changes in its gear box.

On the first day the percentage of those having clean scores was 70.9. This proportion had been able to leave the garage without adjustments, had not had any stops on the road for mechanical adjustments, or lost time from tire or any other kind of trouble. On the second day 38 per cent. of the vehicles

WOLSELEY PETROL-ELECTRIC TAKING A STEEP GRADE.

had perfect scores; the percentage was 52.7 on the third day; 54.5 on the fourth and 60 per cent. on the fifth. Thirty per cent. of the contestants went through the first five days of the tour with clean scores. An observer appointed by some rival firm was carried on each vehicle and was charged to note all stoppages from mechanical troubles.

Frequently machines have gone astray on the road owing to the lack of signs and the inability of the observer to advise. In some cases this loss of road has led to excessive speeding on the part of drivers, simply through a desire to arrive at control on time, though late arrival did not bring any penalty. Generally the schedule is fixed to allow the vehicles to travel rather less than the legal rate of speed; in some cases it is distinctly low, as, for instance, in the three-ton class, where drivers are obliged to hold in their vehicles with disadvantage to their fuel consumption average and average efficiency performance.

Solid tires are not giving complete satisfaction. At least half a dozen different firms have had some difficulty and it would not be surprising if one or two firms dropped out before the end of the five weeks' demonstration entirely, owing to defects of solid tires. The test is not a normal one, for all the vehicles are constantly running under full load—many of them are largely overloaded—whereas in actual daily work they run alternately loaded and light. But notwithstanding this, tire upkeep is too high in several instances. None of the wheels shod with metal rims have given trouble up to the present.

#### CHAIRMAN THOMPSON DISCUSSES ROAD-TARRING.

"Road tarring has been treated scientifically and developed in a remarkable manner in England and France," said Jefferson De Mont Thompson, chairman of the A. A. A. Racing Board, in

A TAR SPRAYER AT WORK ON THE ENGLISH ROADWAYS.

an interview with THE AUTOMOBILE representative on his return from Europe. "Owing to imperfect methods, some of the earlier attempts at treating road surfaces with coal tar were far from satisfactory. The tar failed to act as a binder; it was injurious to the eyes of drivers, as was clearly shown during the race for the French Grand Prix of 1906, and it lay in small pools, where it could be thrown up by the road wheels, to the injury of finely-finished body work.

"This year the tarring of the Grand Prix circuit was perfect; there was no dust and the drivers did not suffer in the least. In England special attention has been devoted to the developing of perfected and economical methods of treating a road surface with coal gas tar, the competition held near London a short time ago bringing before the public a number of efficient machines. The road surface needs to be specially treated, the tar must be put on at exactly the right temperature and under favorable atmospheric conditions. In short, it is the substitution of scientific methods for a rule of thumb procedure.

"From observation of road surfaces in France before and after treatment with tar, I am convinced that the best of these processes, in addition to abolishing the dust nuisance, hold the surface of the road together as nothing else will. My experience is that pneumatic tires do quickly spoil roads that have first been cut up by horses and iron-shod wheels. The continual washing out of water and earth from every depression of the road quickly deepens the hollow until the top surface entirely disappears. When properly treated with tar the surface is held together in such a way that tires have very slight effect on the road. Treating a new road with tar increases the first cost but proves economical in the end."

#### MOTOR 'BUS VERSUS TROLLEY CAR.

The work of the motor omnibus is once again held to be that of feeding tramways and railways from outlying districts, and for heavy street traffic work the electric tramway is easily first says the *Engineering Record*. If motor omnibuses are made smaller than at present, the advantage will be still further with the tramways, so that again lower fares can be charged, which will once more react favorably on the results. The plain truth is that for street service the motor omnibus has never competed successfully with the tram. The advantage in carrying capacity is at present entirely on the side of the tram, and the additional facts that whereas the tramway authorities have to maintain the rails, the roadway between them, and a further margin, and are rated on the track, go again to show that as regards public advantage the trams are much to be preferred. Undoubtedly the motor 'bus will improve. A cheaper fuel and better construction are to be desired, and for the present, at any rate, it cannot compete with the electric tram for urban traffic. These views are upheld by Herr Vellguth, as to experiences in Berlin. Here petrol costs more than in London, where, by the way, it is still rising. In addition, as regards estimates, the short life of the motor 'bus is never properly allowed for. Depreciation allowances are usually quite inadequate.

#### HOW AN AUTO SAVED THE DAY.

Every newspaper man who has done general work and at some time in his career covered a railroad wreck will appreciate the plight of Houston newspaper men recently when news of a wreck thirty miles away was received at night and they found on trying to reach the scene that they would not be allowed on trains going there. When the Houston reporters tried to board a train going to the wreck they were ejected. For a time it looked like a case of no story. Just then one of them happened to think that Hubert S. H. Wilson, the owner of a Thomas Flyer, might be willing to help them out. Several minutes later Mr. Wilson, his brother, and the newspaper men were on their way to Strang, thirty miles away.

ARTISTIC DECORATIVE SCHEME THAT HAS BEEN ADOPTED FOR THE GARDEN.

IN the procession of varied events that hold forth in New York's largest show place, none has succeeded in so completely transforming the interior of Madison Square Garden as have the automobile shows in the past few years. All the familiar lines of the interior of the structure have been eliminated with a view to the production of a complete picture and at the same time a uniform setting. The idea adopted for the coming show, to be held November 2-9, is that of a terraced garden, and the criticism of former years has been heeded and an over-lavish scheme of ornamentation avoided. There will be less staffwork and on the whole a far simpler setting.

The color scheme is to consist of a blending of gray, crimson and white, the girders of the roof being screened by a canopy of the first-named color in place of the artificial sky of last year. The exhibition spaces will be carpeted with crimson, set off by the gray of the aisles. Entering from the foyer, the visitor will be confronted with a towering gateway, a replica of that of the Florio Torresca villa in Florence. It is to have real iron gratings and through them will be visible a garden wall and trees.

The plan of having the elevated platform above the arena boxes extend slightly over the main floor, and of covering the high rear seats to provide a mezzanine floor, will be repeated, and the idea further extended in order to gain more space by decking over the first balcony so as to have the flooring extend beyond the balcony railing, overlapping the elevated platform.

THIRD TIER BOXES.

## SCIENTIFIC TIMING OF AUTOMOBILE RACES\*

By ALDEN L. McMURTRY.

**I**N a race having two or more competitors accuracy of timing is not of prime importance, unless a record is established, for the contest is won on place and not on time, and place is easily determined by the eye of the judges without regard to the timing system. There is room for error, however, even in placing the finishers in a close race between half a dozen or more contestants. But it is in record-breaking attempts and in hill-climbing trials, which are decided solely upon time, that scientific accuracy is required.

The watches called for by the racing rules and generally used for timing automobile events and horse races cannot indicate any divisions of time shorter than one-fifth of a second. This interval is much too long for the purpose, as a race can be won or lost or a record broken by a smaller period of time. The present mile record, made in January, 1906, on the Ormond-Daytona course, is 28 1-5 seconds. This represents an average speed of more than 187 feet a second. At such tremendous speed, a car travels very close to 37 1-2 feet in one-fifth of a second, or fully 2 1-2 car lengths. Now, if two cars were coming down the beach together in a competition trial so great a difference as this would be apparent to the judges and timers, and the second car would be timed at 28 2-5, but if the same cars made separate trials against time they might be tied at 28 1-5 seconds.

But most watches are not accurate even to one-fifth of a second; the movement has not a continuous, progressive motion, but the escapement wheel revolves by a succession of starts and stops, making two stops for each beat of the balance, just as some large tower clocks count off the minutes by the abrupt passage of the minute-hand from one mark to the next. If the stem of the stop-watch were pressed immediately after the escapement wheel had moved the time would be caught correctly, but should the stop not be pressed until the balance had almost completed its swing to release the wheel for the next stop, nearly a fifth of a second would be lost, and a car that had actually covered the mile in, say, 28 19-100 seconds might be caught in 28 flat.

### Inaccuracies in Human Timing and Signaling.

Besides this factor of inaccuracy, or mechanical inadequacy, in the stop-watch, there is the human element to be taken into account. This may introduce a serious error, according to conditions. Some men are more adept at operating the stop-watch than others, and some are alert and quick of movement, while others are sluggish, so that a measurable time may elapse between the instants that three timers will press the stops on their watches for a given car as it crosses the tape. Unless the men who hold the watches are very expert, there is probability of error in determining the instant that the front wheels actually cross the tape. The fact that the three watches rarely agree to the fifth of a second is evidence of the inaccuracy of the present method of timing. Optical illusion also enters into the problem sometimes, especially in very fast record trials. This usually occurs only in the amateur timer, and is eliminated after an hour's constant practice.

Further liability of error exists in the ordinary methods of signaling the start and finish of an event. This is usually done by the firing of a pistol or similar means. In the case of any manually-operated system, some time is consumed in the transmission to the brain of the impression received on the eye. This interval will vary with different persons, just as the period required by the timers to catch the impression of the signal and actuate the stop watches will differ. If the start and finish are both in sight, and the timers take the time by vision in each case, the error will be nearly constant and the time accurate.

\*Extract from paper read before the Society of Automobile Engineers, Buffalo, N. Y., July, 1907.

It is particularly difficult to time hill-climbing contests by the old method when the start is not in sight from the finish line. When the dropping of handkerchiefs or flags by four or five men stationed at turns is depended upon to signal the instant of start from the base to the top, the element of human error is greatly magnified.

It should be evident from the foregoing that far greater accuracy is required in timing motor car events to obtain indisputable results than has prevailed heretofore. All claims for world's records made in this country are accepted with the greatest reluctance by the governing bodies in England and France, whose rules are much more exacting.

Next to the flight of a projectile, the speed of a racing automobile is the fastest terrestrial movement that we are called upon to measure with precision, yet in the one case instruments are used that determine the rate even to the 1-1000 part of a second, while in the other the only method that is officially recognized in America is the use of stop-watches that cannot measure time to less than the fifth part of a second.

### Automatic Timing Machines and Their Development.

The inaccuracies and unsatisfactory nature of the timing of automobile events by stop-watches manually operated were recognized years ago in France and England. The Automobile Club of France offered a prize of 1,000 francs for the invention of a device that would satisfactorily time automobile events automatically. This prize was won by M. Mors, whose instrument was used in some of the earlier trials against time in this country. This consists in an adaptation of the recording chronometer as used in observatories, with means for automatically registering the passage of a car across the start and finish lines. The record is traced by a pen on a strip of paper that is unwound by clockwork. The record can be measured to the hundredth part of a second, and the personal equation is entirely eliminated.

It was in the same year that the automatic timing apparatus devised by the author was perfected, patent applications being filed in June, 1904. This complete apparatus has three distinct functions: First, to time the event by starting and stopping split-second watches and moving the pen of a registering chronometer; second, to signal the start and finish by firing a gun, and, third, to provide telephonic communication all along the course. The problems involved are many, as will be understood from the foregoing summary of various timing methods in use and from the following explanation of the McMurry system.

In order to present the matter more clearly, we will consider the telephone system and timing mechanism separately. The operator at the start is in communication with the operator at the finish and the man at each intermediate station during every instant of a race by means of the wires used also for operating the timing apparatus. Each operator is provided with a transmitter, attached to a metal breast-plate strapped around the neck, and a receiver, attached to spring-metal straps that fit over the head and hold the receiver to the ear. The transmitter is held in a movable bracket having a cam edge-contact plate, so that when the bell-shaped mouthpiece is pushed down away from the face the circuit is broken and cuts out the sound of the gong, so that the operator can hear anything said by the other men on the line. Spring plug sockets are screwed to the case of the timing apparatus, so that quick connection of the telephones with the wiring system can be made. Use of the wire for talking does not interfere with the operation of the timing mechanism on the same wires, as the telephones are provided with condensers which make this dual operation possible simultaneously. In addition to the operators' telephones, there is also a special

patrolman's telephone. This is a small, portable affair, hung from a shoulder strap. It consists of a case containing an induction coil, with a trembler and condenser and a combined receiver and transmitter. The trembler is used for calling by giving a loud buzz in the receivers all along the line. With this instrument and a coil of wire, the patrolman can make a quick dash

FIG. 3.—Wiring diagram of the open circuit.

on a motorcycle along the course to the scene of an accident or of trouble, throw one end of his wire over either line wire, stick the other end in the ground, and at once open communication with the operators at start and finish. There are believed to be only four of these instruments in the country, two of which are in use by the War Department.

#### How the Circuit Is Closed and the Time Indicated.

We may now proceed to a consideration of the means employed for closing the electric circuit when a car crosses the start and finish lines. Various methods have been tried. One of the earliest was employed at the record trials of the Automobile Club of America, on the Coney Island Boulevard, on November 16, 1901, when Henry Fournier established the world's mile record of 51 4-5 seconds. Here the closing of the electric circuit merely rang gongs, by the sound of which the timers started and stopped their watches. A rubber hose was laid across the course and connected with a diaphragm, so that when the air in the hose was compressed the pressure on the diaphragm would close the circuit. This proved unsuccessful, however, as it was found that the duration of compression as the wheels of a car passed over the hose was so short that the pressure communicated to the diaphragm was insufficient to close the circuit.

Finally, an automatic trap was devised that overcame all of these defects. The trap consists of a flat, rectangular box, to the top of which is secured a spring scales registering up to sixty pounds. To one end of the scales is attached a short chain that passes over a metal pulley, having a reduction of one-half, and is connected with a wire strung across the course. The scales are merely for the purpose of determining the tension of the wire, which is usually drawn to a tension of fifteen pounds, indicated as thirty on the scale. Mounted on the end of the shaft of the reducing pulley is a trigger arm that can be tightened on the shaft by a set screw after the trigger has been set. Engaging with the lower end of this trigger arm is a spring-actuated lever that, when released, makes contact with a stationary contact post, and so closes the circuit to start the watches of the timing instrument. At the same time another lever is released that opens the circuit, after a given interval, by means of clockwork, so that the watches can be operated again when the first car reaches the first intermediate post or the finish.

We now come to the consideration of the actual time-indicating apparatus. In its complete form, as first used at the Florida beach meet in 1905, this was arranged to operate six split-second watches. A later form, used the following year, is built for only three watches, as the officials did not care for the intermediate

times and the racing rules call for only three time-pieces. The original apparatus was also provided with an extra relay for operating a registering chronometer, but this was not used the following year, owing to the expense involved and the fact that, notwithstanding the chronometer would have given more accurate and permanent records of the events, the watches would have to be used any way, as there is no provision in the racing rules that allows timing by any other means than watches.

The six watches were set in a row on the panel and secured rigidly in position with clamp screws, so that the watches could be started and stopped by a set of plungers called "sweeps," acting on the stems, and the split hands operated by a set of smaller plungers, called "splits," acting on the escapement knobs. By means of an automatic current-distributor, all six watches were started simultaneously when a car crossed the starting line. Then when it passed an intermediate station three of the splits were stopped to indicate the time for that distance. At the next intermediate point the second three splits were stopped and the first three reset, and so on automatically to the end of the event, when all six watches were stopped. Forward of each watch, below the panel, were magnets which, when energized, actuated the sweeps and splits. Above the panel were two relays for closing the circuits through the battery and distributor.

Besides the apparatus and attachments already described, the mechanism was provided with a third relay for use in connection with a gun mounted on a standard in the timing stand for automatically signaling the start and finish of the race. The gun was a repeating shotgun, which had the stock and muzzle sawed off. After it had been fired it was merely necessary to move the grip to eject the discharged shell and load a fresh shell into the breech. Magnets were attached so that when energized from the batteries, through the relay on the panel by the closing of the circuit through the automatic trap, the trigger was depressed and the gun discharged at the same instant that the watches were started. A switch was provided for each relay and for the distributor. In addition, a milli-ampere meter was secured to the panel, with a key to throw it in circuit, for determining the strength of the current at any time.

#### Merits of the Open Circuit and Loop Systems.

The wiring system of the timing apparatus is so arranged that by the movement of a single lever, operating several switches, the

FIG. 4.—Loop system in the McMurtry apparatus.

system can be changed from the open circuit to the loop system. The open circuit is the simpler and cheaper, requiring batteries at only one point. A diagram of this system is shown in Fig. 3. The arrangement is the same as in an electric bell circuit having two push-buttons, a relay taking the place of the bell. When the circuit is closed at the start (S), the relay (R) is also closed and

the watch (*W*) is started through the action of a magnet (*M*) on the plunger. The same operation occurs when the circuit is closed at the finish (*F*), when the action of the relay stops the watch. So it is only necessary to close the circuit at any point to operate the watches. Against the simplicity of the open circuit are the manifest disadvantages that timing instruments can be used at only one end of the line, and that a crossing of the wires at any point will close the circuit and perhaps put the entire system out of operation.

In the loop system, shown in Fig. 4, the upper and lower contacts are used so that when both keys (*C* and *C'*) are up the two relays (*R* *R'*) are in the circuit. Upon pressing the key a line battery (*B* or *B'*) is inserted in the circuit, and this operates the plungers (*P* or *P'*) situated at start and finish, thereby operating the watches (*W* *W'*). With this system it is necessary to have a battery at each point where a telephone and timing key are to be placed. This is expensive and troublesome, but it has the advantage that as many instruments as desired can be used, and the line is protected against interference by outsiders or the accidental crossing of the wires, resulting in short-circuiting. By constructing the apparatus with the switch previously mentioned, it is possible to use either system as desired, without entailing any trouble in changing the wiring. There are condensers on the relays to prevent sparking, and external magnetism had to be guarded against to prevent magnetizing the watches.

An important feature of the apparatus is its portability. In Florida the instruments at times had to be taken up and transported twenty miles before the tide came up. The traps had to be changed frequently for races at varying distances, as from the kilometer to the mile, in the shortest time. One such change, including a run of 62-100 of a mile, was made in seven minutes. There is, of course, a lag in the mechanical operation of the

instruments, but this is a negligible quantity, since the lag at one end is balanced by that at the other. It has been determined by experimentation, for example, that there is a lag of 1-20 of a second in the series of operations, including the depressing of the wire attached to the trap, releasing the trigger, closing the circuit, the mechanical operation of the relay, closing the local watch circuit, operating the watch plungers and starting or stopping the watches. The firing of the gun is further delayed by the lag of closing the local circuit mechanical operation of the relays, closing the circuit to the gun, pulling the trigger and the consequent striking of the primer and explosion of the powder.

If the purpose of this paper has been fulfilled by showing that accurate timing of automobile events is necessary, and that it is possible to time them to the precision of the 1-100 part of a second by absolutely automatic electrical and mechanical means, whereby the personal equation and the shortcomings of the stop-watch are eliminated, the query will naturally arise: "If the apparatus can be operated successfully, why is such apparatus not generally used for timing important contests and record trials?" The sole reason why scientific timing does not prevail is because automobile racing is not on a sufficiently high plane of sportsmanship. The promoters of the meets are more interested in making them financially successful than in their scientific aspect, and will not pay the necessary cost of providing and operating the apparatus.

Credit for the successful operation of the automatic timing, as accomplished at various meets, is due mainly to Samuel M. Butler and J. C. Kerrison, who were officially appointed as timers, and to the efforts of A. L. Riker, Walter C. Baker and George L. Weiss, who replaced other timers, appointed because of their prominence in local affairs. Only the intelligent co-operation of these men has made accurate automatic timing possible.

## THE DYNAMO FOR IGNITION WORK\*

By R. U. SUTLIFFE.

THAT the dynamo will ultimately replace all other methods of electrical current generation for ignition purposes seems highly probable. The reasons which follow will, I trust, demonstrate that as a direct or indirect source of ignition current, its place in the ignition field is assured. Preëminently, the dynamo as a current generator is permanently self-contained and independent of outside assistance. Perhaps equally important is the fact that a dynamo may be readily designed to generate sufficient current for ignition work, while running at a speed of not over 1,100 r. p. m. It is therefore possible, in many cases, to start the engine direct from the dynamo, without the use of batteries, and thus upkeep expense is permanently eliminated. Furthermore, as is well understood, slow speed adds greatly to the life of bearings and moving parts and decreases the wear on the brushes and commutator.

For touch spark work, the dynamo may be used directly connected through the coil to the engine and will be found the most satisfactory method of ignition because of the higher voltage which it is possible to obtain before the circuit is closed. Owing to the requirements of a dynamo, it is advisable for jump spark work to supply the current to the coils from a storage battery. Without question, the current from an accumulator is best suited for a vibrating jump spark coil.

The dynamo is, for all practical purposes, the only method of keeping a storage battery in condition, and it will be found that one furnishing direct current at the proper voltage and amperage will be most satisfactory. Under any circumstances, a generator especially designed for the work it has to do is most recommended, and such a machine may be directly connected to the battery to be charged, without the intervention of a resistance of

any kind. A magneto will not charge a storage battery. The writer has found a surprisingly large percentage of cases where a small dynamo of the type referred to above is directly connected to a jump spark coil and used with absolutely satisfactory results, sometimes with the interposition of a lamp or two in parallel with the circuit. The reason why this is not always recommended is because of the fact that the condensers of some coils will not discharge against the inductance of the dynamo windings.

There has been some objection advanced against the dynamo for ignition work, as it is claimed they cannot, or have not, been satisfactorily driven. The output of a dynamo varies almost directly as its speed. It is therefore necessary on a variable speed engine to drive the dynamo with a speed governor, as a constant output is desirable. This can be and is accomplished in a number of successful ways, according to whether the dynamo is driven by belt, gear or friction. It takes but a trifle of power to actually drive the dynamo. Hence a very successful and reliable governor may be manufactured. The writer would state from personal observation that he has seen types of friction and belt-driven governors which would maintain the speed of the dynamo constant within a variation of 15 r. p. m. regardless of the speed of the engine. Inasmuch as there are about forty thousand mechanical generators driven by frictional governors on the market to-day, we hardly see how this method is other than practical. The dynamo for ignition work has been on the market over fourteen years. It has stood the test of time and of actual try-out in the field. Every indication points to the fact that the numerous advantages possessed by the dynamo over other forms of current generation for ignition work, both as regards efficiency, durability and economy, are such that it will eventually be universally used for work of this nature.

\*Contributed by Dayton Electrical Manufacturing Company, Dayton, O.

## INDIANAPOLIS TELLS OF COMMERCIAL VEHICLE PROGRESS

INDIANAPOLIS, IND., Oct. 4.—The large increase in the sale of pleasure cars in Indiana this year has been no greater in proportion than the sale of automobiles for commercial purposes. Dealers who have been watching for two years for a turn of the tide in interest in trucks and delivery wagons believe that it has come and that such vehicles will have a phenomenal sale next season. Until this year there were possibly twenty or twenty-three business automobiles in use in Indianapolis, with not more than fifteen or twenty throughout the State. In a single season the number has been more than doubled and sales are still being made in large numbers.

Heretofore inefficient drivers and cost of maintenance have been a drawback to the progress of business vehicles propelled by electricity or gasoline. But this season has been a campaign of education along these lines. Business men have been told that if they expected satisfactory service they must pick satisfactory drivers and pay them well. Where merchants have not cared to maintain private garages, public garages have sold them cars on a special maintenance contract, guaranteeing to keep their vehicles in service every day in the year at little more expense than the usual garage storage fee.

One of the most notable additions to the list of users has been the Adams Express Company, which has just spent almost \$40,000 in displacing horse-drawn service with electric delivery wagons of one and two-ton capacity. A private garage costing \$10,000 has been built and competent machinists and electricians placed in charge. The result has been satisfactory service at a cost small in proportion to the horse-drawn service.

Within a few days the Indianapolis Parcel Delivery Company, which makes a specialty of delivering small packages throughout the city, will place six delivery wagons in service, displacing practically all of their horse-drawn equipment. The N. A.

Moore Grocery Company and the Columbia Grocery Company, retail concerns, are the first of their kind in this city to use gasoline delivery wagons.

Another large concern to adopt modern delivery service is the Glossbrenner-Dodge Company. The Bartlett Trucking Company of Huntington have purchased three trucks, Goyert & Company of Greensburg two, and the Vincennes Automobile Company have bought one. The Fisher Automobile Company of this city has also purchased a large truck for its own use and the Atlas Engine Works has built a large gasoline two-ton truck for service around its plant.

The New York Store of this city has recently added a two-ton truck to its furniture department and is now negotiating for several delivery wagons for use in its general delivery work. For several years the company has used two electric delivery wagons that have given good service. Two automobiles were recently purchased by the local Police Department and they contemplate buying an automobile patrol wagon.

There has also been a noticeable increase in sales of automobiles intended to displace old stage lines. Frank Schwartz recently placed a twelve-passenger 20-horsepower 'bus in service between Seymour and Brownstown, and F. K. Beeson is running a twenty-two-passenger 'bus out of Connersville. Later on a 'bus line will be established between Greensburg and Clarksburg, displacing one of the oldest stage lines in Indiana.

It is probable that next season every dealer in the city will arrange for one or more commercial car agencies. Heretofore they have not handled them to any great extent, believing the time was not ripe. Practically all of the business this season has been handled by two or three concerns, who have been reaping a harvest and laying a foundation for the great expansion that is bound to come during the season of 1908.

## OPPORTUNITIES IN AUTOMOBILE ENGINEERING

DURING the past year the writer has been in a position where his attention was called to the great number of young men, possessing more or less mechanical ability and engaging in various lines of work, who are desirous of getting into the mechanical branch of the automobile industry, says J. C. Austin in the *American Machinist*. Hardly a day passed that did not bring some applicant for a position as tracer, detailer or designer in the drafting department of a large automobile manufacturing concern. Of course, some of these were experienced in automobile work; but a great number were at the time, or recently had been, engaged in an entirely different field of mechanical work, but wanted, as many expressed it, "to get into the automobile line."

This is evident of the general inclination of young men to get into the rather attractive industry, where, as it appears to them, positions with "little work and much pay" may be had without very great effort. To be sure, many young men have worked from lowly beginnings to lucrative positions in the mechanical department of the automobile industry, but these "plums are picked" by men who began early in the race, before the existence of so much competition, and when the demand for men able to produce automobiles greatly exceeded the supply.

The automobile business sprang up as if by magic, and very few draftsmen and engineers had given this line of work much thought or attention. Those who had commanded good salaries, and in view of this fact many were drawn into the work. Automobile production presented an attractive field for capitalists, and numberless companies, offering as many positions, were formed. Up to the present time, or at least until very recently, this state

of affairs produced an abnormal demand for designers in this line of work. Now, however, the industry is settling itself upon a strictly commercial basis, where an employee to "make good" must be a producer; all who are not must fall by the wayside.

The writer does not wish to discourage any ambitious young man who is trying to get into, or is now doing, automobile work, for, for the fellow who is willing to work hard and long, there are many bright prospects ahead; but he does want to emphasize the fact that there is little encouragement to induce the average man, fairly well established in some other line of engineering work, to leave it and enter the automobile industry."

With their average speed of 23 knots, big liners burn 500 tons of coal every twenty-four hours; to achieve an increase of 10 per cent. or to get slightly in excess of 25 knots, it has been found necessary to consume 1,000 tons of coal in the same time. Of course, it is a matter of common knowledge that it does not pay, and the same thing is true of the automobile motor that is twice as large as it need be merely to gain an extra fraction of a mile an hour or simply to be big. It has been proven time and time again, and not a little to the chagrin of the owner of the large car on some occasions, that the light and low-powered car is not alone the equal of the high-powered and correspondingly high-priced cars in many respects, but actually their superior in some. In the A. A. A. tour of 1906 small machines got through where the most powerful cars failed. It is not alone a matter of power for weight; there is a limit beyond which the proportion no longer holds good.

## LETTERS INTERESTING AND INSTRUCTIVE

### FITTING LARGER CARBURETER TO A MOTOR.

Editor THE AUTOMOBILE:

[929.]—Inquiry No. 911 and your answer deal with a question that I have met. Please carry your answer to that inquiry enough farther to explain how one who has an engine that is intended for a one-inch carbureter can successfully attach to that engine a carbureter of larger size. For instance, if the pipes connecting the carbureter with the engine, and the inlet to the engine are constructed for a one-inch carbureter, can a larger one be successfully used without using correspondingly larger connections, and also correspondingly enlarging the inlet to the engine? My automobile was fitted by the manufacturer with a one-inch carbureter. Several manufacturers of carbureters with whom I have corresponded advise that engines having the bore and stroke which mine have require a 1 1/4 or 1 1/2 inch carbureter. At the same time, when I put to them the question above suggested to you, and ask if they will guarantee results if I replace the present one with one of their make and of the size which they recommend, they either do not answer the question or else sidestep it. TENDERFOOT.

Cambridge, O.

An extension of our reply to the letter referred to, as requested in your query, necessitates more data than was supplied by the inquirer in question. If the motor be a single-cylinder, with carbureter attached directly to the cylinder, procure a reducing joint to fit the new carbureter at one end and the inlet to the cylinder at the other. If a multi-cylinder engine, a new manifold may or may not be necessary. Even though a carbureter slightly too small for the motor may have been supplied in the first instance, the capacity of the manifold tubing may still be adequate for the larger size. Of course, the manifold should correspond with the output of the carbureter and be able to pass the volume of gas produced by the latter without difficulty, and without imparting too high a velocity to it as the result of a restricted passage, but it will doubtless often be found that the original manifold can be utilized in connection with a larger carbureter with satisfactory results merely by employing a reducing joint to bring the two together, as already described. If the capacity of the manifold be totally disproportionate to that of the new carbureter it should naturally be replaced, but this would not necessarily entail an enlargement of the inlet of the motor. It would doubtless be an advantage to make this change, but seldom advisable to do so merely for the sake of using a larger carbureter. The equipment of the latter with a new manifold, where really necessary, should give a maximum benefit with a minimum expense. When it comes to redesigning the motor itself, the game is hardly worth the candle, except to those with ample shop facilities and plenty of leisure in which to tinker.

### HOW CAR MEASUREMENTS ARE TAKEN.

Editor THE AUTOMOBILE:

[930.]—Will you kindly inform me how the wheelbase of a car is measured? And also from what point is the tread measured? I have asked several here, and have had several different answers, but I should like to know the true measurements. I am really surprised at our own ignorance in this case.

Woodstock, Minn.

GEORGE MOLINE.

The wheelbase of a car is measured by taking the distance between the perpendiculars drawn through the hubs; in other words the point of contact between the wheel and the ground: literally the wheelbase. The tread is taken in exactly the same manner for the same reasons, for, the wheelbase being the distance longitudinally between the points at which the wheels rest on the ground, the tread is likewise the width of the car between these points when taken transversely. We find it difficult to conceive how such a query could elicit any other answer and are curious to learn the manner in which some of your informants would go about procuring these dimensions of a car.

### SOME QUERIES ON NUMEROUS TOPICS.

Editor THE AUTOMOBILE:

[931.]—I find it necessary to call upon you again to set my mind at rest on some topics, on which I have been unable to obtain satisfactory information from other sources. I hope you will find it expedient to give your replies some space in "Letters Interesting and Instructive."

1. What is a high compression motor (expressed in pounds)?
2. Is it possible to increase compression (granted that valves are well ground) by any other method than by setting a plate in the clearance space in the cylinder head?
3. In a Packard "30," does the inlet close on dead center or before or after the suction stroke has been completed?
4. If the valve closes on dead center, would it help the speed of the motor to advance it a trifle to allow for the moment the piston is travelling over center?
5. In a Packard "30," where does the exhaust valve open? Is not most of the power already used after three-quarters of the stroke has been passed?
6. Will not speed be increased by giving a substantial exhaust lead?
7. Generally speaking, is a low compression or a high compression motor the faster?
8. Given a fast motor, is it not true that placing a plate in the cylinder head (without damaging the motor) will give more compression, giving more power to each impulse but less speed to the motor?
9. What are the gear ratios of the Pierce four-cylinder 28-32 and 40-45 on the high?
10. If a motor is synchronized with the magneto (as the Elsemann on a Packard "30") does it actually advance the spark (in relation to the stroke) by causing the magneto rocker to move farther than it normally moves at full advance?
11. At which point of the armature revolution is the current used? In diagram 1 or diagram 2?

New York.

AL. EISEMANN.

1. Sixty pounds to the square inch is a pretty high average for the automobile motor, so that seventy pounds or over may be considered high, particularly as the practical limit is 90 to 100 pounds.
2. The plate may be attached to the piston, though this is not advisable owing to the disturbance of the balance resulting. The connecting rods may be made longer, or longer pistons may be used with the same connecting rods.
3. Usually a short time after the suction stroke has been completed is the general rule, and we believe will be found to apply to the Packard.
4. It would help the power more than the speed, as keeping the valve open so much longer insures the suction of a fuller charge.
5. Exhaust valves are usually set to open slightly in advance of the moment the piston reaches the lower limit of its stroke. This is termed its *lead*, and, as mentioned above, we think this answers your question regarding the Packard.
6. Within reasonable limits, and where not already allowed for, the speed should increase; but where the lead has already been properly calculated, increasing it further might prove detrimental rather than otherwise.
7. High compression always.
8. If properly done, it should produce more power and more speed, as the former cannot be had without the latter with the same engine dimensions. Power is always a function of the speed.
9. The 28-32-horsepower car is geared 3.3 to 1 with touring body and 3.53 to 1 with limousine body. The 40-45-horsepower car is geared 2.88 to 1, 3.06 to 1 and 3.26 to 1, the first being for touring bodies, the second for limousines and the third a special hill-climbing gear.
10. The spark is not advanced in relation to the stroke by mechanical means, but as the generator voltage and current increase with its speed, the spark is stronger and occurs somewhat earlier as the speed of the motor increases. In consequence, it is advanced more than is indicated by the

position of the regulating lever, or more than is possible with the latter.

11. At neither; these are both dead points. The current wave is utilized when the armature is half way between the points shown in your sketches—that is, when it has emerged half way from the space between the field poles into the polar gap. It would then be at an angle of about 45 degrees to the perpendicular.

Note.—The sketches are not reproduced here, as they simply show a magneto armature perfectly horizontal in one position, and vertical in the other.

#### FROM AN ENTHUSIASTIC TWO-CYCLE ADVOCATE.

Editor THE AUTOMOBILE:

[932.]—Thanks for your reply to my letter. One question more through your valued paper: In the two-cycle engine or any other kind of engine, if a portion of the incoming charge is not consumed, would it not make a smell at the exhaust? I have read this criticism very often, and I have been trying to find if my three-cylinder Elmore engine was consuming all the incoming gas, by smelling the exhaust. I find the exhaust absolutely odorless, and I have been led to believe, on this account, that the combustion was perfect. Am I correct?

Also, if the engine did not consume all the incoming charge, would it not affect the power of the engine? I know of no engine of the size of the Elmore that has as much power.

From my experience I have come to the conclusion that as soon as the buying public become familiar with the merits of the two-cycle engine, when properly made, as in the Elmore, that it will be just the reverse; and the dealers will have a hard job in trying to make them believe that a lot of useless parts to an engine, such as valves, cams, springs, etc., add to the efficiency, when same can be dispensed with, and at the same time all the trouble they give be avoided.

CHAS. J. CHABOT.

Dallas, Texas.

Any unconsumed fuel would be perceptible at the exhaust in the shape of an odor of half-burnt gasoline, provided it were present in more than minute quantities. While all right as far as it went, your test is not conclusive. The time to get down behind and smell the exhaust to see if the fuel is being properly burned is when the car is running—in other words, when the engine is loaded. With the throttle closed, so that but comparatively small charges are being drawn in, almost any engine will run without a perceptible odor at the exhaust, unless in extremely poor adjustment. You are quite correct in assuming that the combustion was perfect with the above modification.

It would affect the power of the engine, but if the latter has been calculated with a liberal factor of safety for the work to be done, as is doubtless the case with your car, this effect would never be noticeable. The designers of your car have taken this factor into consideration in making their calculations, so that the motor will develop all the power needed independently of this. It could only be shown definitely by putting the motor to brake test.

#### WHAT IS THE DEPRESSION OF PNEUMATIC TIRES?

Editor THE AUTOMOBILE:

[933.]—What would be the maximum give in pneumatic tires when a car is running at an average speed over country roads? Would it be about the same on runabouts, light, medium and the heaviest cars? If not, how much depression would there be upon the tires respectively under the various weights?

Am I correct in understanding that all pneumatic-tired automobiles do not give over half an inch? Some light on the above queries would be much appreciated, as parties I have broached the subject to have not been in a position to give any positive information concerning it.

CHARLES E. MALINGS.

Easthampton, Mass.

Even with the requisite data at hand it would be a difficult matter to answer your first question definitely, but as it stands it is not susceptible of an answer at all. These are a few of the facts that should be known: The size of the tire, the degree of inflation in pounds per square inch, the weight of the car, the speed at which it was traveling, and the average height of the depressions in the road surface. Then the question would require two answers, viz.: The constant give

or depression of the tire due to the weight of the car and its load, which would depend upon the degree of inflation and the speed of the car, and its temporary give on meeting obstacles, which would constitute such a variable quantity as only to be accurately ascertainable with the aid of a specially devised recording instrument attached to the wheel. The factor of weight would cover the different types of cars.

Your impression is entirely erroneous, but the opinion is more or less prevalent that a properly inflated pneumatic tire seldom yields more than half an inch, and it is one that would appear to simplify the problem of devising a practical spring wheel. But the facts are quite different. It must be borne in mind that in a pneumatic tire the wheel is held in equilibrium between the road and the tread of the tire. The total pressure, due to inflation, load and speed, is distributed *round the entire circumference*, and the great superiority of the pneumatic tire is due to the fact that this entire ring of compressed air is brought into action every time the tire meets an obstacle. Air is constantly being displaced, but the rapidity with which expansion follows compression makes the process imperceptible to the eye. This is where most spring-wheel inventors go astray, by merely providing for give at the point in contact with the road instead of all round the wheel. Despite its high degree of inflation, a four or five-inch pneumatic tire on a heavy car will give far more than half an inch when driven over an obstacle at speed; in fact, it will give to the extent of its diameter, so that the bump of the rim on the road is very perceptible to those in the car. Thus far, your first question may be answered definitely, in that the maximum give of a pneumatic tire under such conditions is only measured by the diameter of the tire. The rubber and air at the point of contact are compressed and re-expanded so rapidly that if it were not for the very tangible evidence of the rim striking the road the fact would not be known and, at all events, it could not be measured accurately by the unaided eye.

#### AMBIGUITIES OF GEARING TERMINOLOGY.

Editor THE AUTOMOBILE:

[934.]—Will you kindly explain in your columns just what is meant by "six pitch," with reference to gears? I always supposed the number referred to the teeth per inch, same as so many threads per inch in screws. All reference works which I have consulted speak of pitch as "the distance between centers of two teeth at the pitch line." I have frequently noticed in the description of sliding gear transmissions that the gears or pinions are spoken of as being "six pitch"; I have also noticed in catalogues of gears full size illustrations of "six pitch" gears, and these appear to be about the size of transmission gears, yet the distance between centers of two teeth at the pitch line is a trifle over 1-2 an inch, making less than two teeth per inch. If you can explain what the number "six" signifies you will greatly oblige me. Of course I have found other numbers used in this same connection, but they are just as meaningless to the best of my ability in learning the exact meaning.

Minneapolis, Minn.

O. A. WEISS.

Used in this connection, the word refers to diametral pitch, a term which serves to describe a pinion by giving the relation of its diameter to the number of teeth on its periphery. In other words, the number of teeth divided by the diameter equals diametral pitch, usually expressed by simply prefixing the numeral to the word pitch. For instance, a wheel of 12 inches diameter at the pitch circle, and having 72 teeth, would be a 6-pitch gear. But the word pitch is used in several ways in connection with gearing, and it is scarcely to be wondered at that its frequent recurrence with apparently totally different meanings should be confusing. Probably the best explanation of the various meanings is that given by Kent, as follows:

"If two cylinders with parallel axes are pressed together and one of them is rotated on its axis, it will drive the other by means of the friction between the surfaces. The cylinders may be considered as a pair of spur wheels with an infinite number of teeth. If actual teeth are formed upon the cylinders, making alternate elevations and depressions in the sur-

face, the distance between the axes remaining the same, we have a pair of gear wheels, which will drive one another by pressure upon the faces of the teeth, if the teeth be properly shaped. In making the teeth, the cylindrical surface may entirely disappear, but the position it occupied may still be considered as a cylindrical surface, which is called the 'pitch surface,' and its trace on the end of the wheel, or on a plane cutting the wheel at right angles to its axis, is called the 'pitch circle' or 'pitch line.' The diameter of the circle is called the 'pitch diameter,' and the distance from the face of one tooth to the face of the corresponding tooth on the same wheel, measured on an arc of the pitch circle, is called the 'pitch' of the tooth or the 'circular pitch.'"

#### DATA CONCERNING TIRE-FILLING COMPOUNDS.

Editor THE AUTOMOBILE:

[935.]—A year or more ago I had two tires filled with Newmastic tire filling, which was done in Chicago. A couple of weeks ago I ran a puncture in one of them and the filling crumbled and about two-thirds of it came out through the hole before I noticed it. I sent it back but they would not refill it, and I am left with a good tire on my hands which I cannot use. Now if I knew the composition of the filling, I could fill the tire and use it until it was used up, and also fill my remaining two tires. I do not want to use it commercially, but only for my own use. I have experimented with glue, glucose and glycerine, and can get a splendid article all but one thing, and that is, it will melt if left in the hot sun any length of time, while their filling will not melt even on a hot stove. They say in their little booklet that "the compound consists chiefly of glue, glucose, and glycerine," but I know there must be something else used that will not melt by heating it. I do not know if I am asking more than I ought, but as I am a laboring man, with no excess of money, I thought if I could learn the ingredients, together with the proper proportions, of something that would do the business properly, it would help me considerably, and at the same time be of no injury to any one else, inasmuch as they refuse to help me out in any way. I am a subscriber of yours, and get so many good things out of "The Automobile" that I could not refrain from writing you on the subject. ALVIN WALRATH.

Kalamazoo, Mich.

Just what this particular make of tire-filling compound consists of we cannot say, as every manufacturer of such substances has his own formula, which is a trade secret; but a composition which is said to be stable and serve the purpose excellently consists of glycerine and gelatinous silica or aluminum hydrate. This is more commonly known as water-glass, and is used in a liquid state in the proportion of three volumes of glycerine to one of water-glass. After mixing, the compound is further diluted with glycerine so as to be readily used. Granting that this is a good formula for the purpose, it is doubtful whether you can benefit by it, as such compounds, are usually forced into the tires under considerable pressure and by special machinery. Then, again, it is necessary to extract all the old filling without damaging the tire, and probably the difficulty of doing this was the reason for the proprietors of the compound you mention refusing to treat your tire a second time. In fact, this is the great disadvantage of any tire-filling compound. Your tire may apparently be good, but doubtless it would not stand filling a second time and, though seemingly sound, has outlived its usefulness. Probably a new tire is your best remedy.

#### TAKING UP PLAY IN A LOOSE STEERING GEAR.

Editor THE AUTOMOBILE:

[936.]—My car is comparatively new, and has been taken care of properly, driven moderately and the like, so I think I may say it is in good condition. All adjustments were O. K. when taking it out of the garage a few days ago, but while travelling over a country road I suddenly felt the steering gear give in some way or other and was considerably alarmed, in view of the endless number of fatalities that are attributed to defects in this part of the car. On returning to the garage and examining the gear, I found that the steering wheel could be moved fully an inch in either direction before it had any effect on the front wheels.

I am aware that this is a condition that the majority of cars get into sooner or later, as can be proved readily to one's own satisfac-

tion by testing the wheels of a number of cars in any public garage. And I also know that if I take my car to such a place I will either be laughed at and told that such a thing needs no attention, or will incur a substantial bill of expense for something that I can doubtless do as well myself. At any rate, the job will be done more conscientiously, and certainly nothing on the car should be more carefully adjusted than the steering gear. The latter is what is known as the worm and sector type, and I would like to know how to go about adjusting it so as to take up this excessive backlash.

Greenport, Del.

STEERING GEAR.

As a car is running straight ahead for practically nine-tenths of the time it is under way, wear on the part of the steering gear is localized, so that after considerable service the parts of the worm and segment corresponding to a few degrees either side of the straight ahead position will be found to show wear, while the latter recedes very perceptibly toward each end, and at these points there is scarcely any apparent wear. Care must accordingly be exercised in adjusting such gear to take up lost motion by moving the worm and segment into closer contact; to see that they are not brought so close together at a worn point that they will bind when turned to a position at which there is still the original amount of metal. Herein lies the difficulty of properly adjusting an old steering gear, which has probably given rise to the indifference of the average repairman to such a defect. The driver of a car also becomes familiar with exactly how much further the steering wheel needs to be turned on this account to obtain the desired effect, and in consequence is scarcely aware of its presence.

Such conditions should not obtain on a comparatively new car, however, and it would appear that the adjustment of the segment-shaft bearings must be at fault. It is difficult to conceive how the gear could have given way to such an extent all at once otherwise, as wear at one point would only make itself perceptible gradually and after long service. We think a close examination of the gear will show that some adjustment has given or let up, and retightening it will remedy the difficulty.

#### CAN ALCOHOL BE USED IN STEAM CAR BURNERS?

Editor THE AUTOMOBILE:

[937.]—Can you inform me whether the burning of alcohol in any of its forms in steam vehicle burners is practicable? Also if there have been any experiments along such lines, and with what results?

EMMETT G. MURRAY.

Los Angeles, Cal.

There is no reason why alcohol could not be utilized for this purpose, as it is employed in various ways for heating. So far as we know, there have been no experiments of this kind undertaken, for the simple reason that up to the present the price of alcohol has not been such as to permit of its use as a fuel in competition with any of the substances now generally employed.

#### PASSENGER TON MILE DATA WANTED.

Editor THE AUTOMOBILE:

[938.]—Have you in your files any information regarding ton mile costs or passenger mile costs of motor cars using gasoline as fuel? Some time ago test runs were made under the jurisdiction of one of the automobile associations, to determine maximum mileage per gallon of fuel, and I thought you might direct me to the records made.

Any information you can give me, either as regards your own files, or other reliable source of information, on this subject will be greatly appreciated.

E. BROWER.

New York City.

The results of the two-gallon economy test, held under the auspices of the Automobile Club of America, were fully described in the issue of THE AUTOMOBILE of May 10, 1906.

To our knowledge there is no such data extant in this country, but a great deal of it has been compiled on the other side, and could doubtless be had on application to the secretary of the Royal Automobile Club, London, or the Automobile Club of France, Paris.

ONE WHO WORKED WITH MR. SELDEN.

THE AUTOMOBILE:

[1939.]—In your September 28th issue a letter appears signed by Paul Lacroix, in which he endeavors to belittle the original Selden gasoline buggy.

Will you permit me, through your columns, to ask Paul Lacroix if he knew George B. Selden in 1877-78, and heard him at that time sit in his office and prophesy what has lately proven to be facts—that the automobile has almost displaced the horse in cities? He says: "Between such a car and even a mule, give me the mule." It is not a very gailant effusion, but it shows the tendency toward mulishness which Mr. Lacroix has shown with great fervor in his communication.

If we will but stop to consider that in 1877-78, when I saw George B. Selden's engine and knew the construction he was endeavoring to bring forth, which was before any such thing as a gasoline-driven automobile had ever been tried, we will wonder that Mr. Selden could possibly invent a car which would move at all. The writer superintended the mounting of this engine, which was partly built in 1877-78, and, even now, I will acknowledge that I am not only pleased but gratified to know that a car invented at that time shows as good results as it does.

That Mr. Selden is a bright genius has been proven many times, and many men have accorded him the compliment of being a very uncommonly bright man. Mr. Selden is a personal friend of mine, and I cannot resist taking up the cudgels in his behalf. Between the mule (P. L.) and the car, give me the car.

Perhaps Mr. Lacroix expected to prove a racing car was a touring car with immense power, but I dare presume to say that Paul Lacroix did not even notice that there is no carbureter in same, instead of which the gasoline is pumped into the combustion chamber. We all, both great and small automobile manufacturers, should take our hats off to George B. Selden.

Miamisburg, Ohio.

O. B. HATFIELD, SR.

WHO WILL EMPLOY THIS AUTO SALESWOMAN?

Editor THE AUTOMOBILE:

[1940.]—As a subscriber of your valuable magazine, I take the liberty of writing you a few lines. I am a young woman of education, good talker, fine saleswoman, who, having taken up the automobile trade, wish a place with some factory or firm, as chauffeur, or demonstrator, or will take a place in a public garage. I can do repair work; in fact, I worked side by side in the shop with the boys, and can get under a machine same as a man. I am willing to go any place on the globe to work, as soon as I can obtain a position in automobile work. I have tried to obtain work here in Chicago, but, so far, have been unsuccessful. Why is it that I should be discriminated against, simply because I am a woman? I am energetic, ambitious and more than willing to work, only wanting a chance to prove my ability and make good. I was in hopes I could get a chance to drive a car from here to Los Angeles, Cal. I know the trip would be full of hardships and an expensive one, but thought I could make it more than pay by stopping at principal places en route and selling cars, which I am sure I could do. I have a number of advertising schemes which I am sure would be of benefit to my employers if given a chance. They might as well take me into the game, first as last, because I have come to stay! I never give up anything I once undertake, and am not afraid of hard work; so hope to succeed in time. Now that I have explained myself, do you know of any firm or factory who would employ a real live one? I can furnish excellent references. I am going to try the West if I cannot get a position here in the East. Hoping you will pardon this lengthy letter, and may know of something favorable for me, I remain,

541 Wabash avenue, Chicago.

KATHRYN LOCKWOOD.

WANTED—SPECIAL CAR FOR THE SOUTH.

Editor THE AUTOMOBILE:

[1941.]—If the Ford Motor Company could be induced to make a runabout with a 60-inch tread (the standard gauge in the South), I personally know of at least twenty-five people that would purchase a car. I have been unable to prevail on them to make a car of this gauge, and if you can furnish me with the name of some other dealers who are turning out a cheap, high-powered runabout that will make a car with 60-inch tread, something to successfully compete with the Ford, I will greatly appreciate the information, as I desire to secure the agency so as to handle the car.

The manufacturer who will put a first-class cheap car with "Southern standard gauge" on the market that can be used on other than hard roads will certainly greatly increase his sales. The roads are very good for a 60-inch car, as the sand is only a couple of inches deep, and the car can be placed in the wagon ruts and they run nicely with very much less gas than when driver is straddling the ruts with his 56-inch car.

1908 REO ROADSTER, 18-20-HORSEPOWER, THE NEW LEADER OF THE REO LINE.

IN holding back the details of its new models for 1908 until just preliminary to the opening of the New York show season, it is quite evident from a perusal of the specifications of the new cars, as well as from their greatly improved appearance, that the builders of the Reo have been actuated by motives other than secrecy. In other words, they have had a great deal to uncover, for the new Reos represent a fitting advance over their predecessors in many ways. The line will consist chiefly of three models—the Model A, two-cylinder 18-20 horsepower, five-passenger touring car; Model B, 10-horsepower, single-cylinder run-about, and the Model C, 18-20-horsepower roadster, this last forming a most attractive addition to the line of two-cylinder cars now on the market, as will be quite evident from the accompanying photograph of it. It is not to be inferred from the fact that changes have been made that these are in any way of a radical nature, as such is not the case, the cars being the same in practically all their essentials as they have been since originally brought out.

More room, more power and quieter running have been the aims of the designers throughout, and as a result the body of the touring car has been enlarged, the motor has been made more powerful, though still retaining all its distinctive features, and the gear-set has been made quieter running than ever, which is also true of the motor itself. The diameter of the wheels has been increased from 30 to 32 inches, and they will be equipped with 3 1-2-inch Michelin tires on Goodyear detachable rims, instead of the 30 by 3-inch standard equipment hitherto employed. This gives the car one inch more clearance and insures much easier riding and longer life to the tires, besides greatly improving the appearance of the car. In addition to the foot accelerator for the throttle, which has always been a feature of the Reo, an effective spark and throttle control is now placed over the steer-

ing wheel, affording all the convenience only to be found in very much higher-priced cars. The muffler, which is fitted with a cut-out, is no longer visible, having been located transversely at the rear of the car and over the axle. An improved style of fenders has been adopted, having liberal-sized flanges and aprons which afford complete protection for both the car and the hood. On the motor itself, a new and improved timer having roller contacts has been adopted, thus insuring better service from this essential, with greater durability.

Safe as the brakes fitted on the 1907 Reo proved themselves on the long and steep hills encountered in the A. A. A. tour, the braking system has been improved by the addition of an emergency rear wheel brake with improved brake lever, fitted in an outside quadrant ratchet with hand release. The driving mechanism has also been improved by the adoption of a noiseless chain, while the rear axle driving-shafts are now made with tapered ends for the reception of the wheels, which are locked on by keys and nuts, thus insuring positive reliability in this highly-important essential.

As the Model C roadster is being listed at \$1,000, it is evident that this will be considered as the leader of the Reo line and a review of its specifications will be of interest. The frame is of usual channel-section, pressed steel, supported on semi-elliptic springs forward and full-elliptics in the rear, the running gear consisting of 32 by 3 1-2-inch artillery wheels. As already mentioned, the latter will be fitted with 3 1-2-inch Michelin tires on

REO FIVE-PASSENGER TOURING CAR, 18-20-HORSEPOWER.

Goodyear detachable rims, this equipment being standard for both the touring and roadster types. The motor is of the twin-cylinder, horizontal-opposed type, the cylinder dimensions being 4 3-4 by 6 inches, bore and stroke, respectively, with a conservative rating of 18-20 horsepower at a moderate normal speed, which is made possible by the long stroke, the latter in turn only being made

possible on account of the location of the engine on the chassis. The cooling system consists of a tubular radiator supplied by a gear-driven pump. The valves are all mechanically operated and the moving parts fully protected. The carbureter is a special Reo design, while the ignition is of the high-tension type, using dry cells as the source of current. Lubrication is automatic.

As the first step in the transmission of the power, a multiple disc type of clutch is employed between the motor and the planetary gear. The latter provides the usual two speeds forward and reverse, final drive being by single chain, the differential being mounted on the rear axle. Three brakes are provided, all of them double-acting, the running brake being located in the driving sprocket, while the other two are in special drums on the rear wheels. The steering gear is of the worm and segment type and reversible. The car has a large running radius, as the fuel tank has a capacity of twelve gallons of gasoline; but four gallons of water are needed for cooling. The passenger capacity is two under ordinary circumstances, with a special folding seat in the rear, accommodating two more, and making it practically a four-passenger car. The equipment consists of three oil lamps, two Gray & Davis gas lamps, with B. & L. mirror lenses, generator, horn and complete tool and tire outfit. In complete running order its speed range is up to 45 miles an

FOUR-PASSENGER, 10-HORSEPOWER REO RUNABOUT.

hour. With a special top it lists at \$1,040, or the top separately may be had at \$50.

The remaining member of the Reo line is the popular single-cylinder runabout with its 10-horsepower motor, which has shown itself capable of performances entirely out of proportion to its size.

With some exceptions, its specifications are identical with those of the larger cars, in spite of its low price, \$650. For instance, the foundation of the chassis consists of an angle steel frame, while the suspension is three-quarter elliptic in front and full elliptic in the rear. Tubular roller bearing axles are fitted, the running gear consisting of 28 by 3-inch wheels, which will also be fitted with Michelin tires. Except that it consists of but a single-cylinder instead of two, the power plant is an exact replica of those employed on the larger cars and calls for no further description. This also applies to the transmission throughout, from the multiple disc clutch back to the driving axle. The gasoline capacity is six gallons and the car is capable of doing 15 to 25 miles on a gallon of fuel. Complete with folding seat, giving it a capacity of four passengers and with the usual equipments of lamps and tools, it lists at \$650 complete, and the continued popularity this small car has enjoyed during the past two or three years is ample evidence that the one-lunger of popular parlance has a place all its own and will be as much in evidence during the season of 1908 as it has been at any time since it was first superseded by the multi-cylinder models, with their high-powered engines and heavy bodies, which tend to make tire maintenance excessive.

### SOUTHWEST ENTERS MANUFACTURING FIELD.

For the season of 1908, Texas will be a factor in the American manufacturing field. The newcomer hails from Houston, Tex., and will be known as the "Dixie Flyer." It is the product of the Southern Motor Car Company of that city, and the concern plans to assemble about 30 cars during the remainder of the present year, in order to fill orders already in hand, and expects to have an output of about 150 cars during the coming year. The company will devote its attention to a 25-30-horsepower, four-cylinder water-cooled chassis, and will supply it either as a touring car or runabout. The wheelbase will be 102 inches, the running gear of the roadster being 32 by 3 1-2 inches, and 30 by 3 1-2 inches on the touring car. The power plant will consist of the Reeves Model H, water-cooled motor, coupled to a Hassler transmission, as built by the Marion Motor Car Company, Indianapolis, Ind. Contracts have been entered into with other well-known makers of standard parts, and during the first part of its career this pioneer manufacturing concern of the Southwest will confine its attention to assembling, merely building the hoods, bodies and fenders in the home factory. Plans are also made to include a six-cylinder model in the line, and its details will be announced later. The model cars shown by the concern have met with a very favorable reception, and the outlook for an excellent business during the coming year is very bright.

### INDICATING THE FARMERS' AUTO INTEREST.

Next to the State Fair held at Columbus, the Wood County Fair held at Bowling Green is said to be the most widely known fair in the State of Ohio, although it is held in a rural district. T. F. McManus is a regular visitor to the fair and drove there this year in a Wayne "Thirty." On entering the carriage gate he was surprised at the number of cars, for there were almost as many autos as there were carriages, notwithstanding the fact that the crowded attendance consisted mainly of farmers. It was found on investigation that the same state of affairs existed at the other gate. The display of automobiles so excited the curiosity of the party from Toledo that the secretary of the fair was appealed to for figures, and it was found that up to that time 616 machines had been registered, which represented about half the total number that actually attended, as about that proportion failed to register. Turning back, the secretary showed that three years ago exactly three automobiles were registered. Pursuing the subject further, Mr. McManus was curious to learn if the majority of auto parties were not from the cities, such as Toledo, Cleveland and Columbus, but was informed that the proportion of urban machines was very small and that the majority belonged to dwellers in the rural districts.

### A DETROITER'S PREDICTION FOR NEXT SEASON.

Charles L. Palms, chairman of the board of directors of the Wayne Automobile Company, Detroit, Mich., says:

"My belief in the statement that next season will be the brightest in the history of the automobile industry is based upon the fact that from a mere trailer and pupil of the foreign nations, the United States has at last come to be the greatest manufacturer and producer of automobiles in the world. From an output of 314 machines in 1902, this country has increased its operations till in the year 1906 over 60,000 machines were produced; 1907 is going to exceed that number, and 1908, according to my opinion, is going to exceed both. When the United States were turning out 314 machines, France manufactured 24,000 in the same length of time. In 1906, France manufactured 55,000 machines; or 5,000 less than did the United States. Not only has this country jumped into the leadership in output, but foreigners are coming here in a steady stream to get ideas and suggestions to improve the cars of foreign make."

A PART from those minor detailed changes which are the result of changed conditions, or have been suggested by experience in the handling of a number of cars, the Moline line for 1908 will be practically a replica of the cars of the same make during the present year. The latter has proven so eminently satisfactory in every way that the designers have come to the sensible conclusion to let well enough alone. On the four-cylinder models there are a few changes in the appearance of the car, the most noticeable being those in the new form of radiator and hood adopted. For several years the Moline cars have carried a distinguishing feature in this essential, made after a design original with the builders. It was so arranged as to slide forward to uncover the motor, the construction being such that the radiator was entirely covered by the hood instead of standing out in front of it. For 1908 this feature has been discontinued and a standard type of folding hood adopted in its place, this also necessitating the employment of a different shape of radiator in order to conform to the lines of the former.

Another change in the cars comprising this part of the line consists of the adoption of a new style of mudguards or fenders, which are flat instead of flaring, and are so attached that there are no brackets or bolts of any sort on the under side that might come in contact with the tires. They are also provided with a drop on the inside to protect the body and the hood. They are finished the same as the remainder of the car and serve to make a decided improvement in its appearance as a whole. The mechanical side of the car has come in for as much attention as its appearance, and as a result there have been made a number of minor changes in the motor itself, which in themselves, however, are of such small consequence as to be scarcely perceptible to the Moline owner, but which in the aggregate serve to make the motor more powerful, durable and quiet running.

During the past year the two-cylinder model of the Moline met with unprecedented success and has been continued in exactly the same form and the same price for 1908 as has prevailed during the present year. The

motor with which this car is equipped embodies numerous distinctive features, and it is exceedingly well built throughout after a design that experience extending over several years and with a large number of cars has proven to be correct. It has ample power for its weight, easy riding springs and a well-proportioned body, which doubtless accounts for the excellent service it renders as well as its great popularity.

The four-cylinder cars are known as Model A and Model S. The latter is the smaller of the two and is equipped with a 24-horsepower, four-cylinder vertical motor, the cylinders being cast in pairs and measuring 3 7-8 by 4 1-2 inches. A three-speed sliding gear set is employed, and final drive is by shaft, the counter-shaft of the transmission being idle on the direct drive. It has a 100-inch wheelbase and 32 by 3 1-2-inch tires, front and rear. The suspension consists of a 3 1-2-inch semi-elliptic spring placed transversely forward, and two 4 1-2-inch full elliptics in the rear, using scroll heads. With the usual equipment, this car lists at \$2,000.

Model A is equipped with a four-cylinder vertical motor having a 4 1-2-inch bore by 5-inch stroke and conservatively rated at 35 horsepower, with a gear-set similar to that employed on the smaller car. The wheelbase of this larger model is 110 inches and 34 by 4 inch tires are used all round. Its remaining features are similar in the main to those of the 24-horsepower chassis. In complete running order it lists at \$2,500.

The Moline Model H completes the line. This is the double-cylinder horizontal opposed type, the motor measuring 5 by 5 inches and being rated at 18 horsepower. The gear-set is of the planetary type, providing two speeds forward and reverse, and is equipped with nickel-steel pinions running in oil. The

TWO-CYLINDER 18-HORSEPOWER MOLINE MODEL H.

car has a 92-inch wheelbase and 30 by 3 1-2-inch tires are fitted on all four wheels. The suspension and other features are similar to the other cars, and the same high-grade materials and workmanship employed on the more expensive cars are also used in the building and fitting of the two-cylinder model listing at \$1,250.

DESIGNER MOOERS PILOTING THE 1908 MOON ROADSTER.

FOR the season of 1908 the Moon cars, made by the Moon Motor Car Company, St. Louis, Mo., will consist of three models. The main feature of the line will naturally be the standard five-passenger touring car; then there will be a special roadster and a seven-passenger touring car. Both the roadster and the smaller touring car have a 110-inch wheelbase. The former is hung very low and provided with full-elliptic springs in the rear, making it an exceptionally easy-riding car. The seven-passenger car will have a wheelbase of 121 inches, and the running gear will consist of 36-inch wheels, shod with 3 1-2-inch tires on the front and 4 1-2-inch tires on the rear, while the five-passenger car and the roadster will have 34 by 3 1-2 quick-detachable tires on the front and 34 by 4 1-2 on the rear.

In other respects the design of the Moon cars as originally evolved has been continued. Thus, the motor with its distinctive overhead camshaft and oppositely-disposed valves in the head, operated by short rocker arms, has been left unaltered, with the exception of small detailed refinement that has been found possible here and there as the result of experience, the design itself having proven eminently satisfactory and efficient. It will be recalled that in this motor the camshaft with its integral cams is located on top of the cylinders, where it is supported on three liberal-sized bearings. It is driven through bevel gearing and a vertical shaft at the forward end of the motor, directly from the crankshaft, this superimposed position eliminating many of the small parts otherwise necessary, and making for great simplicity of operation and quiet running, as but four rocker arms and four cams are necessary to actuate the eight valves. The ignition timer is located on the rear end of the camshaft, which brings it in a most accessible position. An important addition to this essential of the motor consists of the adoption of the Eisemann high-tension

magneto as a standard part of the equipment, the spark plugs being fitted with independent switches to facilitate testing.

The multiple disc clutch, which has previously been a feature of the Moon, has been retained intact. It consists of 53 discs, 26 of which are of bronze and the remainder of steel, each of the latter being made with three small spring projections, these insuring the ready separation of the discs in disengaging and preventing the clutch taking hold with a jerk. The clutch, as a whole, is encased in a bronze housing filled with oil, thus protecting it from dirt. Its diameter is very small, thus permitting the use of a large flywheel with fan-shaped spokes, while the self-contained construction of the clutch permits of its removal without disturbing other portions of the mechanism merely by the removal of three cap screws.

The gear set is of the sliding type with selective operation, and gives four speeds forward and the usual reverse through the customary single lever. The gear-set housing is of aluminum and is supported on a special subframe by projecting arms, permitting its removal intact without disturbing its connections. The pinions and shafts are all of hardened steel and the former are made with a central web, insuring uniform expansion in hardening. A universal coupling is interposed between the clutch and gear-set, while the cardan shaft is fitted at each end with similar joints to compensate for relative movement. These joints involve no screws or nuts and are enclosed in dust-proof, grease-filled cases. The bevel-driving unit is supported on ball bearings and is housed in the differential case, which is a steel casting with an easily removable aluminum jacket. Universal joints are also employed at each side of the driving gears and absolutely prevent binding, besides giving the great advantage obtainable by setting the rear wheels in at the tread 2 1-2 degrees, the same as the front wheels.

MOON MODEL MODEL C, ON A FOREST PARK ROADWAY, ST. LOUIS.

# A STORY OF AN AUTO'S THOUSAND-MILE RUN

By E. RALPH ESTEP.

THE wise ones of New York's motor colony smiled and knowingly nodded towards the indefinite sunset place as, about 10 o'clock of an early Summer morning, a dirty blue automobile swung northward out of Long Acre Square. The loose Abe Lincoln shape of the man at the wheel supported a face that was mostly petrified smile, until you looked closer and read a determination in the eyes. It was a sure-enough Western outfit, come to learn the tricks of the wide, smooth Eastern highways. Car and driver had bumped, jumped, dashed and rattled over the uneven, sinister highways of Michigan and surrounding States.

The vehicle, prototype of the season's output of a great automobile factory, and its three fellow experimental cars, had proven their stability in abusive work where the roads are such only by the grace of name, and where speed is only a relative quality in ability to overcome obstacles. Now the car would show its full pace on interminable miles of smoothness, long gradients, and wide turns, which taunt the driver to take them at railroad speed and test to finality the theoretical quality of differential end thrust.

Out through the suburban seats of the almost-New Yorkers, the new Packard "Thirty," herald of 1908, fretfully picked a way through the restrictions of habited territory and dashed into the freer country. Then the spirit of the chase was on them all. The versatile pilot from New York forgot his past. Sailor, cook, teacher of his native Greek, automobile man, were all wiped out by his reincarnation into a detached being with senses only for the road ahead. Waldon forgot Detroit and letters on the sales manager's desk. The "Thirty" answered 'he wild phantasmal call of the road.

Through the orchard-like Connecticut countryside, past hedge-bound, peacefully slumbering rural homes, around macadam corners that tempted danger as they rose over rock-built hills or dipped into the fresh, green verdure of quiet valleys, the car attained the fullness of its speed.

A train came along, and with tooting whistle dared them to try their metal in merry joust. Mile after mile was swept into the trail of dust obscuring the past. Between the Connecticut villages, where the car was slowed to a staid and orderly gait and where the train hesitated to trade passengers, the race was repeated in unlimited miles at the rate of fifty an hour. Occasionally the ocean broke into the kinetoscopic picture. It was a new and glorious experience to Waldon. A peculiar education is needed to drive a car successfully over the smooth New England highroad.

It was three-thirty when the party burst into the civilizing influence of Hartford. Here they lunched, and at 5 started northward for the "Hub." The New York guide gave way to Fuller, the Packard exponent among the bean-eaters, with a doleful: "Gee, I wish I was going on to Boston." "Come along,"

said Waldon, and he clambered into the tonneau, heedless of the rough roads he knew to be ahead. Later, he tried, in rapid succession, all five seats in that tonneau and a few above it, as the car pitched and tossed over each rocky hiatus in the continuity of Massachusetts highway improvement.

Dodging the traffic which cluttered the streets of Springfield, the tourists followed another car whose dust-dimmed tag, by its alphabetical prefix, denoted the property of a Springfield automobile dealer. They ran close to it and asked to be shown the way to Boston. The driver answered "Sure," buttoned up his coat, pulled down his goggles and started out to do it. A somnolent cop at a cross street was taken unaware and left to think it over. The native car rushed a hill, and then the Detroit realized that the man ahead intended to show him the road to Boston by a trail of dust. He ran alongside to make sure, again asking the way to Boston. The stranger nodded—but was behind at the top of the hill.

Once in the country the race began in earnest. The New Englander's valor had not reckoned on his competitor's prowess. Time after time the mad chase became a play, as the Western car passed the volunteer guide and then dropped back to give it another run. The beaten one stopped and mentioned a poor carbureter mixture. An offer to wait for it to be adjusted he waved aside with a gracious "You've got us licked, but ours is only a 30-horsepower car." "Same as ours," laughed Waldon. As though the formality had been overlooked before the duel, the principals exchanged cards, waved adieu, and the man who would have shown the way to Boston laconically pointed to the right fork in the road.

Fast, and without hesitation, the flight continued from Springfield to Worcester. Other motor traffic seemed as stationary as the houses, trees and little hamlets. A speck appearing on the horizon grew quickly to a motor car, flashed by, and was baptised in dust. The country took on the manner of ultra-civilization; villages became more frequent; church spires silhouetted against the gray-grown sky of early dusk; the road ahead sank into puzzling obscurity, and night put an end to the riot of color on the western rim of the world. But, also, in the deepening shadows of the east twinkled the lights of Boston. It was only half-past 8 when the car drew up at the Motor Mart, but the pilot was not hungry in spite of the rough trip.

Boston was inquisitive about the new "Thirty" and the car was given over to it the next day. In the evening, with eight aboard, fast as the car could go it repeated history in an unthrottled dash to Ferncroft Inn. It was over the Newburyport turnpike, built in 1578, at the order of the king, that the governor, on horseback, might ride straight as an arrow's flight to Newburyport. History must have winked at this latter-day interpretation of her original purpose.

Saturday was a dismal day. The gods had

"THE ROAD RAN ALONG RIDGES AS A NARROW SHELF, WHOSE END STRAYED OFF AND DOWNWARD INTO WATER-LIKE OCEANS OF CLOUDS."

"WITH RAILS, FULLER AND WALDON PRIED THE CAR UPWARD."

shut off the sunshine and Jupiter raved. There was none to go back with Waldon to New York, especially when he hinted at a mountain trip to Pittsburg. Finally Fuller and Graves dared each other to the sticking point, and just as the car was ready to leave the garage began telephoning their homes and hunting suitable apparel. Fuller was wrapped like a mummy in layers of store clothes, with a coon-skin sarcophagus. Graves wore the regulation rubber motor coat, adding a fanciful touch with a woman's rubber cap, ruffled à la bedtime.

Being full of knowledge *re* the highways and by-ways of Massachusetts, Graves took the wheel and started out in the pouring rain. He had no goggles. The water beat back the rubber ruffles that fringed his face, and rivulets of rain flowed down his neck. The car skidded some and slipped more. Into puddles where the water shot above their heads and increased their drenching, banging over bridges, skidding around sharp corners and following rain-filled ruts, Graves took them to Providence. Here they changed clothing and ate dinner. Then Fuller drove.

Straight and highly crowned, the road was not wide enough for two to pass—evidently the work of some narrow-minded supervisor. Coming suddenly upon a wagon widely loaded with the furniture of a farmer who had been careless in the choice of moving day, Fuller drove far out into the boggy ground at the side. She sank. "Keep her going," shouted Waldon. "Keep her going," echoed Graves, but, with a mighty splash and a great upheaval of mud, the car sank in the morass up to its all four hubs.

Luckily this was a region of stone and rail fences. With rails Fuller and Waldon pried the car upward, while Graves industriously lugged stones from the fence and built a solid foundation underneath. It was hot work. Finally the rock road was built and the car was driven onto the slender ribbon of macadam.

Waldon drove down toward the Atlantic and here the good road was lost in the sand and rocks along the coast. The road dodged among large boulders tattooed with advertisements—alternating with the protruding corners of orange-gray rocks on which the country is laid. Towards evening it was a dreary way, made still more depressing by the raucous complaint of the winds from off the now turbulent Long Island Sound. When New Haven was reached Graves evinced great desire to see the Yale University buildings and the domestic life of regular rah-rah boys. It was seven-thirty and so a stop was made for the night. Graves took the midnight train home.

Sunday morning, after a 10 o'clock start, Fuller and Waldon enjoyed a pleasant, sunshiny trip along the coast to New York. They spent only time enough in the Metropolis to eat a hurried lunch while a tire was changed, and, with a New Yorker on board

for pilot, headed for Staten Island to enjoy the good, pretty run to Quakerville. Out on the level highways of New Jersey, the testing of the car took a high speed turn. Perth Amboy to the Camden ferry was done in two hours.

From the garage at Philadelphia the Godshalks were telephoned—they who make motor boats and sell Packard cars. At the mention of Pittsburg the elder Godshalk wanted to go, but was finally induced to compromise on Clarence, young enough to stand the bumping which the mountain road prophesied. Another passenger was desired, and Clarence produced Bill, an ingenuous friend, unused to wild, overland motoring. "Poor Bill," said Fuller and Waldon as they thought of what would happen to the innocent.

\* \* \* \* \*

Godshalk pere advised a 5-o'clock start. Said he: "It is just as easy to bounce out of bed at four as at nine. All you have to do is to bounce." The start actually was made at five-fifteen, Fuller drawing by lot the first seventy-five miles in the front seat, with the two Quakers luxuriously reposing in the tonneau as the car rolled easily over the fine roads past Fairmount Park and Ardmore toward Lancaster.

It was a wet and cheerless beginning. The pervasive moisture robbed the matutinal venture of its rightful charms. The roads were good and ahead lay the mountains, taunting them to come and test the stuff that cars are made of. Somehow or other the call of the cook-stove was stronger, and with eager eyes they searched each paltry puddle of huts for a restaurant sign. At Coatesville they found it, and Waldon and Fuller were garrulous in their talk of breakfast. Uninitiated Bill only smiled. He had had his. The restaurant was just opening for the day, and Waldon fried eggs while Fuller concocted a sepia-toned liquid yclept, in kindness, coffee.

Near Lancaster a turn was made away from the Harrisburg road, southward towards Gettysburg. The Susquehanna at Columbia looked muddy and sullen in the rain-drenched atmosphere of full daylight. Here the road crossed on the Pennsylvania Railway bridge, a mile and a quarter long, with its tracks in the center and the ties boarded over to provide roadway wide enough for one, but not two, of anything to pass.

The tortuous line of oozing mud between the highway fences led southwest to a country of tender memory. At Gettysburg, the National Park and on to Chambersburg the leaden inertness of the chill rain seemed to become vibrant with echoes of the war. Thoughts motoring became much mixed with thoughts now resurrected from school books for verification in the very place of their beginning. At Chambersburg a new supply of gasoline was obtained. The mud-caked radiator was doused with water from a pail and scrubbed out with a broom.

Now began the real battle against the elements and the fortresses reared by nature in a harsh land—a land of many mountains and a few people. These people, too, seemed strange to visitors and to motor cars. They talked in nods or monosyllables and were surely stunned by this mud-smearing creation of an outside world which splashed through the almost impassable country with amazing speed.

The first climb into the Blue and succeeding mountain ranges was a long, steady pull of four and a half miles to the top of Cove mountain. As yet no anti-skid chains had been put on the tires, and the car veritably slipped up the mountain. The roadstead was an endless chain of "thank-ye-marms," fifty feet apart. Clattering over the uneven bed of rocks, skidding and sliding and bumping along the wind-racked, rain-soaked mountain side, the car passed several teams working hard their discouraging way, and whose every driver would declare future progress of the motor car soon would be impossible.

Once a buggy was passed and the driver tried to hold the speed of the car as it set the jarring pace upward. Of course he tired out the horse and quit, but at the mountain top, where the motor car had been stopped that tire chains might be put on, he came up and waited so that the automobile would not have to

pass him on the dangerous downgrade which seemed to be merely a rough and slippery path cut around the edge of the precipitous mountain wall.

As the car started down the 18 to 20 per cent. grade, some fiendish instinct in the native, or, perhaps, a booze-built desire to show his mountain skill and general dare-devilishness, prompted him to whack the unfortunate horse into a wild run. Dancing over "thank-ye-marms," hitting, dodging and scraping the huge boulders which littered the road, striking the jagged corners of rocks turned edgewise at the surface, the car careened madly down the slope. Close behind it came the buggy, flung high at each "thank-ye-marm," swinging from one side of the road to the other with each rapidly succeeding lurch, crowding the horse in his vain endeavor to hold the difficult pace over the heart-breaking path, the wheels vibrating until it seemed they could no longer stand the abuse. At the bottom of the long flight appeared a toll gate, but so close behind was the runaway buggy that a stop spelled disaster. Waldon pulled the car to the side of the road, ran back of the gate-keeper's house and the buggy whizzed by, to disappear into another mountain trail.

Mountain ridge followed mountain ridge, and between them were fifteen-mile stretches of hills. Only ten miles on all the way from Chambersburg to Pittsburg were level. Ever climbed the car through the continual rain, over roads built only of rock. It was like the bed of a river. As far as the eye could reach, flat stones, gathered between the fences and laid side by side to form ridges, were interspersed with the bald, slippery knobs of huge boulders. "Thank-ye-marms" became an obsession. Reckoned carefully, there must be nineteen thousand between Philadelphia and Pittsburg. Waldon drove the car obliquely over them, zig-zagging along the road to lessen the impact.

Bill was the surprise of the party. Innocent though he might be and unbroken to the hardships of testing tours, there was no yellow streak in him. When he opened the rain-soaked lunch and found it filled with gravel thrown into the car during its plunges into watery holes, he laughed—and pointed out a small mountain village wherein lived a school teacher of youthful and tender recollections. When the tire chains broke he was the first out to fix them, the while chattering of his once best girl that lived in the particular neighborhood. In fact, nearly every mountain peak or every bunch of scrubby trees which still reared their rickety limbs against the elements reminded Bill of some bit of fluff who had held hands with him in his youth.

Teams were scarce now, but occasionally there would be an encounter to lend a touch of humor. Once a farmer, coming up the steep grade, raised his hand and the car was stopped. The motor was shut down, and, on the farmer's signal, the car coasted noiselessly past, while the farmer held his horse by the bridle. Suddenly the horse, with deliberate maliciousness, pasted both back feet into the dashboard of the buggy, although the car was fifty feet down the road. The farmer's wife jumped out and, as the car slid down around the curve and out of sight, yelled: "I'll bet somebody'll pay for this!"

A tire burst at the foot of the last mountain ridge. An hour and a half was spent in making the repair, and it was dark when the last climb was started. The night gathered quickly, and was full of a thick solemnity. The headlights cut an uncertain, discouraging, rock-floored aisle through the everlasting gloom. The climb continued through clouds that made a fog against which the lamps were as impotent as though their light was thrown upon an opaque sheet. Coming out above, the road ran along ridges as narrow as a shelf, whose end strayed off and downward into the water-like ocean of clouds which floated unceasingly about the immemorial peaks.

Progress was slow and dangerous, yet there was a certain enchantment following the whimsical way which led now below, now above, now down through the clouds where that officious beldame, Fate, held the safety of the car and its occupants in her hand. The rays from the headlights were absorbed in twenty feet. Waldon steered through the fog by watching the telephone

poles alongside the road, which were the only visible objects. Once, following the poles along the inside of the narrow ridge that was the road, unable to see the edge—beyond which was death—the guiding line switched to the precipice side of the road, and the driver, not knowing this, followed their course almost to disaster.

Many times in making the uncertain descents with no knowledge of what was ahead, there would suddenly jump out of the enveloping fog the abutments of a bridge just far enough apart to let the car pass through. Sometimes a mountain waterfall would give warning of a bridge, but among the crooked walls of rock the sound gave no certain knowledge of location.

As the road finally dropped for the last time below the cloud fog and debouched into the wide valley where was a leveler, though not a level land by any means, the car struck what certainly must be three miles of the worst road in all the United States. It is just east of Ligonier and the business of the people is log-hauling. Wagons go down hill in the soft mud, which helps the brakes to retard them against the influence of the grade. Continual driving of this kind has made the road a river of mire, full of rocks—some buried, some protruding. They scraped the running boards, hit the hubs and stopped the car until they were laboriously lifted from their tomb of mud and thrown to the side. Here travel was at the rate of three or four miles an hour. Through the fearful uncertainty of the last descent two hours had been consumed in making thirteen miles.

It was nearly 11 o'clock when the lights of Greensburg were sighted. Waldon turned to commiserate with Bill, who had been given such an heroic introduction to motor touring, but there was Bill, still eager and happy, still unstunned—humming to himself the words of "In the Good Old Summer Time," set to a new and wonderful tune, syncopated, against his will, by the bouncing of the car. "Billy Bounce!" That would be it—the nickname of this as yet unchristened car. And Billy Bounce it became, officially and with a cup of coffee ceremoniously spilled over its bonnet before a Greensburg restaurant.

Two Greensburg hotels turned down the mud-calculimined quartet on sight. Consequently at the third place Bill left his outer garments in the car, while, more or less clean, he went in alone to negotiate for beds. Even there mine host required that they wash in the public lavatory before ascending to their rooms.

\* \* \* \* \*

The next morning there was an easy run of thirty-two miles into Pittsburg. The 343 miles over the Alleghenies had been accomplished. Waldon was satisfied. Fuller was satisfied. Bill was satisfied. The car was turned over to a factory man to be driven home. Waldon and Fuller climbed onto a train for Detroit and the last they saw of Bill on the depot platform his smile had broadened into a cheerful grin as he jumped up and down in imitation of his "thank-ye-marm" experience of the day before. "Good old Bill—Billy Bounce!"

**In the Consideration of the Track Racing Question.** High-speed racing on circular tracks, originally constructed for horse racing, is now attended with the element of danger to such degree that men who value human life cannot be censured for hesitating at further encouragement of what must stand convicted, because of the growing list of fatalities, of being a reckless form of sport. When the limits of skill must be exceeded to bring victory, or the opportunity for so doing irresistibly tempts the contestant, then sane sportsmen must admit that the place for calling a halt has been reached.

Furthermore, the officers of the American Automobile Association are proceeding properly in consulting the manufacturers, who are directly or indirectly responsible for the greater part of the entries, and the clubs of the association, which in the past have conducted most of the meets.

Racing being a spectacular proposition, it is bound to receive a vast amount of publicity and attract the attention of the public. The attention which it has been commanding of late is more harmful than beneficial. But the question should receive—and it undoubtedly will—judicial consideration, not alone for the good that has been accomplished in the past along with the bad, but also for what may be retained for the future.

Granted that it may be politic and logical for the A. A. A. to refuse in future its sanction and jurisdiction over this kind

of track racing, it is a certainty that there will continue to be more or less use of the horse tracks for automobile events until other provision is made in the way of special courses. Local clubs would appear to be the proper ones to look after a less strenuous form of competition, and it appears to be a foregone conclusion that track racing is destined to be less strenuous and more local in character than ever before.

**Trend of Motor Design for the Coming Year.**

Now that the show season is practically upon us, it seems opportune to ask: What, if any, will be the changes it brings forth? It is safe to say that never in previous years, not even excepting last year's shows, was there a time in which the stock and stereotyped phrase "only detailed refinement" was so overworked as it will be at show stands during the next few months. However, there has been a break in the sameness brought about by the settling of designs in well-defined grooves that will give the makers and their salesmen something to talk about, and that is their six-cylinder models. That the six-cylinder car will hold a big place on the floor, so far as popular interest is concerned, there is little or no doubt. It is going to be a notable year for the six-cylinder, all arguments to the contrary notwithstanding.

But whether there will be more sixes sold at the shows than fours is quite another matter. While taking up the new type, very few makers indeed have relinquished old attachments, and their lines will merely be that much more comprehensive. They are all out after some of the six-cylinder business. Whether they stick at it depends upon whether the six-cylinder holds its popularity. Though pretty thoroughly tried out already, it has still to work out its own salvation where the great majority of auto-ists are concerned.

Speaking of motor design proper, there is not a great deal to record. The superimposed camshaft has gained a recruit or two and the advocates of head placing for the valves have strengthened their position to some extent. Where powers are concerned, motors are larger than ever and smaller than ever, an anomalous statement that is readily explained by the fact that while some have still continued to reach for the upper extreme others have begun to realize that the day of the sane and safe automobile is drawing near and that there will be far more 20-24's sold than 60's, and have planned their lines accordingly.

**Has the Highest Point of Advantage Been Passed?**

It was long ago realized in marine engineering practice that beyond a certain speed every extra knot had to be paid for so dearly as to scarcely make the game worth the candle. Where a 15-knot speed could be obtained at the expenditure of 100 tons of coal a day, it was found that 400 tons of fuel were consumed in the same time to make 20 knots. The same thing is just coming to pass in automobile design, and that fact could hardly be better illustrated than by a comparison which the *Autocar* makes of the sizes and speeds of some of the cars in the more important Continental road races during the past season.

Practically every one of these events was very closely contested, many of the competitors who finished but a short time apart and averaged almost the same speed throughout the race having cars, in some cases, which were equipped with very much larger motors than their competitors. For instance, the winner of the Coupe de Velocité had an engine 1.8 times as large as that of the winning car in the Florio cup, yet the speeds were nothing like that far apart. In another instance, the larger car had an engine that compared with the motor of its competitor in the ratio of 2.2 to 1, yet with such an overwhelming superiority in engine power the average speed of the larger car was but 3-4 mile better than that of its far smaller rival. It only goes to show that racing car motors have been carried far beyond the point where the greatest advantage is to be gained, and greater refinement rather than greater size is what is needed.

### WALTER WINS TRENTON EIGHT-HOUR RACE.

TRENTON, N. J., Oct. 5.—Instead of a 24-hour race, the big automobile event at the Inter-State fair was reduced to 12 hours and finally cut down to 8 hours. A Walter, driven by Joe W. Parkin, Jr., with his father acting as his mechanic, evolved as the winner, covering 357 miles. Another Walter, driven by Edwin Walter, was second, with 347 3-4 miles; third was a Franklin, 290 1-4 miles; fourth, a Stearns, 163 miles. A Thomas car, driven by Paul Schill, and a Rolls-Royce, driven by Burns, were other starters.

The race began in the afternoon and concluded at midnight. The wide half-mile track gave plenty of room to the contestants and was fully as safe as the average mile course.

The first few miles of the race were well contested. Immediately the Stearns, Thomas, Bolls-Royce and the Walter, driven by Joe Parkin, shot to the front and trailed one another closely. On the fourth mile an accident happened to the Stearns, which put it out of commission for almost an hour. A bolt in the clutch snapped and the car was sent to the inclosure for repairs.

The most excitement of the early miles of the race was furnished by the Walter car, driven by Joe Parkin, and the Rolls-Royce, and it almost ended in a serious accident. On the twenty-fifth mile the Rolls-Royce made an effort to pass the Walter. For five miles they raced side by side and took the turns dangerously close to one another. On the thirtieth mile the English car assumed the lead, but it was only for a few minutes, as at that point a tire on the front wheel of the Rolls-Royce burst and the car swerved to the side into the fence. The fence was torn down for a short distance, but aside from a torn tire and a few dents there was no damage done. Neither Driver Burns nor his mechanic were injured, and after a delay of twenty-five minutes the car resumed the race.

### AERONAUTS PREPARE FOR ST. LOUIS RACE.

Last Monday evening many of the foremost aeronauts of the world assembled at the headquarters of the Aero Club of America, 12 East Forty-second street, New York City, to discuss preliminary arrangements for the International Aeronautic Cup race, which is to start from St. Louis, October 21. Major Hersey, U. S. A., who accompanied Lieut. Frank Lahm on his victory of last year, has obtained permission from the War Department to compete, and will use the balloon *United States*, last year's winner. The balloons *Pommern* and *St. Louis* have arrived at St. Louis from Brussels and Paris, the former being the balloon in which Oscar Erbsloeh won the International Aerial Congress race, September 15.

Among the prominent American aeronauts present were Frank S. Lahm, whose son won the international race last year; Alan R. Hawley and J. C. McCoy, two of the cup defenders this year; Homer W. Hedge, former president of the club; Leo Stevens, J. deMont Thompson, William J. Hammer, Augustus Post, W. R. Kimball, E. B. Bronson, J. C. Lake, Dr. Calvin T. Adams and Charles Jerome Edwards.

### PELLETIER TO MANAGE FIRST DETROIT SHOW.

DETROIT, MICH., Oct. 7.—With twenty-five dealers, representing some half hundred standard cars, pledging their support to the undertaking, the Detroit Automobile Dealers' show, scheduled for the week of December 9, is already an assured success. It was decided some time ago by the dealers that they would have an exhibition of their own, independent of what the Tri-State Auto and Sportsmen's Association, under whose auspices previous events of this nature have been held, might decide to do. The expense will be borne proportionately, and the fact that it is up to them to make good furnishes added incentive. The management of the affair has been placed in the hands of E. Leroy Pelletier, one of the best known of Detroit's publicity men, who is already busily engaged in the work.

### OLDS AND ATLAS WERE BRESLIN DRAWERS.

At the usual ante-show luncheon, given by the Hotel Breslin to the representatives of exhibitors in the Grand Central Palace and Madison Square Garden shows, held Tuesday at 1 P. M., the lucky winners in the drawing for the privilege of exhibiting cars during show week were Oldsmobile and Atlas.

The A. M. C. M. A. cars figuring in the drawing were the Ford, Berliet, American Mors, Maxwell, Welch, Acme, and Crawford.

The licensed candidates for a week of hotel corridor publicity were the Lozier, Locomobile, Stearns, Haynes, Peerless, Apperson, Hewitt, Pierce, Columbia, and the lucky Oldsmobile, represented by C. H. Larsen. C. H. Martin drew for the Atlas.

Gen. John T. Cutting, Col. K. C. Pardee, H. T. Clinton, Alfred Reeves, E. S. Partridge, C. G. Wridgway, and Harry Caldwell, purveyor of "gasoline gossip" in the *Evening Telegram*, were the speakers, with T. F. Moore as the versatile toastmaster, and G. T. Stockham bidding the guests welcome to the Broadway hostelry, which is always during show weeks one of the headquarters of the trade.

### AEROCAR PLANT MAY BE REOPENED.

DETROIT, MICH., Oct. 7.—That A. Y. Malcomson, principal owner and guiding spirit of the Aerocar Company, is still far from down and out is evident from developments in connection with the financial entanglements of that concern. Mr. Malcomson got the plant at the foreclosure sale, and now it is announced that he will shortly reopen it, putting a water-cooled car on the market for the coming season. The plant is admirably adapted for the building of automobiles, having been constructed solely for that purpose, and the concern should once more become an active figure in the trade. It is understood that C. Arthur Benjamin, for some time general manager, will be retained in that capacity.

### CHICAGO'S PRACTICAL RELIABILITY RUN.

CHICAGO, Oct. 7.—The Chicago Motor Club has decided to promote a three-day reliability run of 600 miles during the week preceding the opening of the Chicago show. The dates selected are November 26, 27 and 28, respectively, and the contest has been divided into three parts, first day being to South Bend and return, 200 miles; to Milwaukee and back on Wednesday, and to Rockford, Ill., and return, Thursday. There will be three classes: one for cars selling at \$1,500 and under, the second class for cars under \$3,000, and the third for cars over \$3,000. In the matter of sealing the committee proposes to be most strict, but it is not going to do as the New Yorkers did—disqualify a car if a seal is broken. Instead there is a penalty attached.

### SHOEMAKER AUTO COMPANY GOES TO ELKHART.

On October 10 the Shoemaker Automobile Company, which since its organization has been located at Freeport, Ill., removed to Elkhart, Ind., where a new factory has been erected. It will be recalled that the first try-out of a Shoemaker car was in the gruelling mud rout of the A. A. A. last summer, in which it acquitted itself remarkably well, while its driver, who is also its designer, was exceedingly game in the face of a string of misfortunes that would have made the average driver turn back long before the tour was half over.

### TWO MORE A. M. C. M. A. MEMBERS.

During the past week, the American Motor Car Manufacturers' Association, popularly known as the "independents," added two additional firms to its constantly increasing membership roll. The new members are the Continental Auto Manufacturing Company, New Haven, Conn., and the Brush Runabout Company, Detroit, Mich., the admission of which brings the total membership of the association up to 51 manufacturers of complete cars.

## OCTOBER WEATHER STIMULATES CLUB LIFE

### CONDITIONS IN CENTRAL MASSACHUSETTS.

WORCESTER, MASS., Oct. 7.—Worcester Automobile Club members, looking over the season which is closing for driving, take satisfaction in the conditions which have prevailed this year, regarding the lack of bother which has been meted out to autoists in Central Massachusetts by the constables and the courts of the section. Club members, who have been members for the past three years, note the diminution of the trap troubles, and feel the action of the club has been one of the means to that end. The vigorous action of the club on this and other lines has had its effect. Leicester, the most prominent of the towns from its location on the main line between New York and Boston, saw no profit in employing men to give the town a bad name among automobilists, with no corresponding remuneration to its treasury, and this year has been off the map as a trouble-maker. The other towns which in a lesser degree had been on the motor blacklist followed suit and there has been little trouble in Worcester county all this season, which is a matter for general congratulation.

The local club has taken action on the line of the Automobile Club of America, and will have a club plate. In fact, the movement began before the members learned of the action of the A. C. A. The club seal is as nearly a replica of the seal of the city of Worcester as is practicable and the "Heart of the Commonwealth" appears in its center or chief, heraldically speaking.

Preparations for the annual banquet of the Worcester club late in November or early in December are being made.

### NEW JERSEY CLUB'S ENDURANCE RUN, NOV. 15-16.

NEWARK, N. J., Oct. 8.—The twenty-four-hour endurance contest of the New Jersey Automobile and Motor Club has been set for November 15 and 16, the date having been decided upon at a meeting of the racing committee held last Thursday night, at which time the rules to govern the contest were reviewed. Secretary Bonnell has drawn up the complete regulations and they will be substantially the same as those governing the three-days' contest held last spring. The arrangements have not been perfected as yet, however, and it will be several days before definite announcement is made. The route as outlined in a former issue of *THE AUTOMOBILE* will probably be followed with few changes, except that the Eagle Rock road may be selected either going or returning. The start will be made at an early hour Friday in order to finish in good season on Saturday. As the fee is only \$10 a large number of entries is expected.

It is understood that the club will seek new quarters further uptown when the year's lease on the building at Broad and Chestnut streets expires. Some of the members are desirous of having the club in the suburbs, but the majority favor a central location and advocate the erection of a special building somewhere in the vicinity of Military Park.

### MARYLAND CLUBS COMPLETE A. A. A. BODY.

BALTIMORE, MD., Oct. 7.—The Maryland State Automobile Association of the American Automobile Association was formally organized last week at the first fall executive meeting of the Automobile Club of Maryland. The organization will comprise the following clubs: Automobile Club of Maryland, Baltimore Automobile Club, Baltimore County Motor Club, Hagerstown Auto Club, Allegany Auto Club, and the Motor Car Racing Association.

The following officers were elected for the new association: President, Osborne I. Nellott; vice-president, H. M. Rowe; secretary, F. M. Darling; treasurer, W. S. Belding. The board of directors includes these officers and W. W. Baldwin. At the first semi-monthly meeting State work will be outlined.

### KANSAS CITY (MO.) CLUB HAS A PARADE.

KANSAS CITY, Mo., Oct. 7.—The Automobile Club of Kansas City held its first annual parade last Tuesday. Every car in line was gayly decorated and, it being festival week, everybody was smiling and happy. There being no assignments of places in advance, everybody who came went to the end of the line, excepting, of course, the women drivers, who were given the preference and placed near the head of the parade. After going through the downtown business section, the caravan proceeded to Elm Ridge, watched a horse race and an exhibition by a horse, and then the autos became the feature of the fair and circled around the track time and again. The drivers fully enjoyed the idea of going as fast as possible, and several impromptu races took place. One man in a "Lemon," as he calls it, went around so fast that several people in the grandstand saw him both coming and going at the same time. As no watches were held, no records were broken, except verbally. When the time came for

PARADE OF THE AUTOMOBILE CLUB OF KANSAS CITY.

the next horse race, the autos were still speeding over the track at a rapid gait. The judges yelled at the motorists to leave the track, but they took their time and enjoyed a few minutes more at high speed. The crowd gradually dispersed and went home well satisfied with the day's pleasure, voting the parade a success, all promising to be in line again next year.

### BOSTONIANS TO HOLD GYMKHANA THIS WEEK.

BOSTON, Oct. 7.—The Bay State Automobile Association will hold its second annual gymkhana games at the Newton Athletic Grounds, in Newton, Mass., next Saturday, October 12. Secretary James Fortescue has been actively engaged in making preparations for the affair for some time past. The list of events will include many of the familiar "stunts" that go to make up an occasion of this kind, together with a number of original ones which should prove amusing as well as interesting, as they are designed to test the skill of the drivers, besides displaying the stability and flexibility of the cars themselves.

### MINNESOTA AUTOISTS TO STOP THEFTS.

MINNEAPOLIS, MINN., Oct. 5.—Owing to the large number of automobile thefts that have been committed in the Twin Cities of late, the Minneapolis Automobile Club has decided to prosecute every one caught taking an automobile, whether in fun or for the purpose of realizing on the theft. In order to catch these thieves the club has engaged permanently the services of a detective, who will be on hand at the clubrooms all the time.

and will go out on a chase after lost automobiles at a moment's notice. The chief of police has promised to co-operate.

Arrangements have been perfected by the Twin City automobile clubs for trip to Duluth about the 20th of October. Twenty-five entries have already been made. Duluth is a popular Mecca for automobile tourists, although the roads leading there are not all that could be desired. The State Automobile Association has taken the matter up and is raising funds to perfect the highway, the opposition, curiously enough, coming from farmers along the proposed route. They are, however, being shown the advantages, and the tide of illfavor is being turned.

The State Automobile Association of Minnesota has just issued a touring book, compiled by George H. Daggett, chairman of the tours committee. The book gives elaborate details as to the various routes radiating from the Twin Cities. Twenty maps locate the main highways and cross roads.

#### BUFFALO CLUB CELEBRATES THIRD SUCCESS.

BUFFALO, N. Y., Oct. 7.—The Automobile Club of Buffalo last Thursday night celebrated its third consecutive success in the annual A. A. A. tour, its 1907 Glidden trophy team being the guests of honor. Drivers Salzmann and Richards, of the Thomas; Dey and Kumpf, of the Pierce, and Gus G. Buse, Jr., the Packard pilot, were the heroes of the occasion. President William H. Hotchkiss, of the A. A. A., was one of the speakers, and he reiterated his ideas on track racing, commended the Connecticut law, and condemned the statute in New Jersey. E. R. Thomas,

chairman of the Western New York Roads Improvement Association, said that a good road from Buffalo to Niagara Falls is to be a realization of the near future. Incidentally, Mr. Thomas said that he intended to issue instructions to all the Thomas agents asking them not to enter cars in track competitions under present conditions.

#### RHODE ISLAND CLUB ACTIVE IN SIGN POSTING.

PROVIDENCE, R. I., Oct. 7.—As the start of its projected road posting campaign, the Rhode Island Automobile Club of Providence will shortly commence the work of marking the road between this city and Narragansett Pier, posting all turns and dangerous places. The signs will be a departure from ordinary usage in that they will be only three feet high and will be placed near the edge of the road so as to be illuminated by the car's headlights. Later the club will erect sign posts on all the suitable touring roads of the State.

#### ROCHESTER CLUB'S HILL-CLIMB OCTOBER 12.

ROCHESTER, N. Y., Oct. 7.—The Rochester Automobile Club will hold its annual hill climb, Saturday, October 12, at the Penfield Dugway. The early date was decided upon because of the automobile show to be held in New York later in the month. There will be twelve events, open only to members of the club, with the exception of two free-for-alls, which will be open to members of any club or of the A. A. A. Entry blanks are now ready. The entrance fee will be \$2.

## BOSTON'S ANNUAL FALL AUTO TRADE CHANGES

BOSTON, Oct. 7.—Boston's automobile trade is just now undergoing the usual fall reorganization. The movement from the older automobile section in the vicinity of Columbus avenue toward the newer section on Boylston street and Massachusetts avenue is very pronounced this season, and already several firms are opening new Quarters on Boylston street. The completion of the Copley Squares garage has also brought about some changes, two or three firms having taken quarters there for sales or garage purposes. Among these are the Dodge Motor Vehicle Company, distributors of the Pope cars, and the Butler Motor Car Company, which sells the Cleveland, Pierce-Racine and the Rapid. The Stranahan-Eldridge Company, agents for the Buick, has also taken space in the Copley Square garage and is about opening a salesroom on Boylston street near the Massachusetts Automobile Club.

Another newcomer on Boylston street and also in Boston is the J. W. Bowman Company, agent for the Stevens-Duryea cars, which also has garage space in the Copley Square garage. Mr. Bowman was formerly of New York. For many years the Stevens-Duryea has been handled in Boston by F. E. Randall, and after his death last spring the agency was conducted by his widow. It has now been transferred to the Bowman company and the Randall estate will have the Pennsylvania, with a salesroom on Columbus avenue and a large garage on Stanhope street. Another shift in agencies in the Boylston street section is the transfer of the Premier from George C. Squier to H. L. Johnson, who comes here from the factory. He has a salesroom at 1008 Boylston street.

It is understood that a change in the A. E. Morrison Company, agents for the Oldsmobile and the Stearns, will shortly be announced. Arthur Adams, who had charge of the Oldsmobile sales, has the agency for the Oldsmobile the coming season, and it is said that he will organize a new company for the handling of the Oldsmobile exclusively. Whether the Morrison company will continue with the Stearns is not settled. Mr. Morrison has been under the weather all summer on account of an injury at Lowell on July 4, while engaging in a road race, and has not yet announced his plans. No changes have yet been announced at the Henshaw Company, agents for the Haynes; the Matheson Company of Boston, the Locomobiles branch, of which K. M. Blake is manager; the Dragon branch, the Lozler agency held by H. C. & C. D. Castle, the Shawmut branch; the Columbia branch, of which J. H. MacAlman is manager; the Winton, Peerless, Ford, and Franklin branches.

The White Company has just opened a new garage on Newbury street, which will be conducted in connection with the White branch nearby under the management of J. S. Hathaway. The J. W. Maguire Company, agents for the Pierce, has also expanded, tak-

ing in the adjoining store on Boylston street formerly occupied by the Napier Company. Alvan T. Fuller, agent for the Packard and the Cadillac, has increased his salesrooms by leasing the apartment on the Columbus avenue side of the Motor Mart formerly occupied by the Apperson agency. The Apperson agency has been transferred to F. S. Smith, of Columbus avenue, who has handled the Autocar and Walter. The Maxwell-Briscoe Boston company is expected to remain in the same location on Massachusetts avenue, and the Bay State Company will continue to manufacture the Bay State Forty on Norway street. A. R. Bangs, who manufactures the Viking, has removed from Boylston street to his factory on Stanhope street. The Curtis-Hawkins Company, of the Motor Mart, which formerly was the agent for the Grout, has taken on the Chadwick for 1908.

There is some uncertainty about the Thomas agency in Boston. It is said that the Harry Fosdick Company, which has handled it recently, will have something else for the coming season, and it has been reported that C. E. Whitten, of Lynn, is to be the Thomas representative. Since Mr. Whitten made his announcement, however, there have been reports to the effect that the matter was not definitely settled. W. M. Jenkins & Co., of Columbus avenue, are to handle the Mitchell, and the Metropolitan Automobile Company, of Stanhope street, will have the Moon another year. H. C. Stratton Company, which last spring located on Huntington avenue, has added the Queen to its list of agencies, now representing the American Mercedes, Car de Luxe, Kissel Kar, and the Queen.

V. A. Charles assumed the management of the Rambler branch this summer, succeeding Clarence Gilmore, who went first to the Knox and then to the White Company, and beyond a few changes in personnel the Rambler branch remains the same as in former years, being located on Columbus avenue. The Corbin agency remains in the Motor Mart under the name of the Corbin Motor Car Company, formerly the E. T. Kimball Company, and the Northern Automobile Agency, of the Motor Mart, formerly representing the Pullman and Pennsylvania, now has the Pullman only. The Frayer-Miller agency, formerly held by D. P. Nichols & Co., has given up its Motor Mart salesroom. The George H. Lows Co., agent for the Aerocar and American Mors, has not made known its plans for 1908, and the same may be said of the St. Louis agency on Boylston street. Bond Bros., agents for the Deere, the Dolson agency, Darracq, and some other cars.

It is too early yet for the announcement of agencies for new cars, but there is every reason to believe that after the New York shows nearly every car manufactured in the United States and most of the prominent foreign machines will have representatives in Boston.

### NEW COMBINED THRUST AND RADIAL BEARING.

Albert F. Rockwell, president of the New Departure Manufacturing Company, Bristol, Conn., is the inventor of a new type of ball-bearing which will be publicly shown for the first time at the coming show in Madison Square Garden next month. It differs radically from current types in that two rows of balls and two sets of ball races are utilized, thus making the bearing capable of taking a thrust as well as a radial load. It is designed to take the

PART SECTIONAL VIEW.

place of the combined end thrust and radial load bearings at present in current use on automobiles, the load being equally distributed on the two rows of balls by means of a special form of separator, which is shown by the illustration picturing a bearing of this new type with the races partly broken away to reveal the interior. By this means the load is taken on a diagonal line from the vertical instead of radially and in such places as a bevel-gear driving unit, where the line of pressure is at right angles to the base of the teeth of the pinion, the load is intermediate between the radial and end pressure and is taken care of to the best possible advantage. The separator is designed to permit the use of the greatest number of balls possible, and is supported by the two rows of balls. The latter are of the company's own manufacture and have been used successfully for years in New Departure bicycle and motorcycle coaster hubs. The chief advantages claimed are the greater load carrying capacity of the new bearing due to the use of two rows of balls instead of one, and the possibility of employing a correspondingly smaller size of bearing to perform the same service. The results of some remarkable tests will be displayed in connection with the exhibit at the show.

NEW RADIAL AND THRUST BEARING COMPLETE.

A large addition to the company's plant at Bristol, Conn., is now nearing completion and will be devoted entirely to the manufacture of the new bearings, which will be exploited not alone for automobile construction, but for many other uses as well. Several makers of automobiles have already tested out the New Departure bearings on their cars during the past season and will make them a feature of the construction of the 1908 models. In addition, exhaustive tests of the new bearings have been made in the home factory and they have shown up so well under them that the company will operate the new addition to the plant to its full capacity from the start.

### TRUFFAULT-HARTFORD SHOCK ABSORBERS.

Though highly efficient in other respects, it has been found difficult when using shock absorbers to set each one of the four, or each pair, front and rear, to work together; that is, so that each one would oppose the same amount of frictional resistance as the others, and this is a fault that the makers of the Truffault-Hartford shock absorbers have eliminated in the 1908 model of that device, by unique means. An indicating arrow and dial have been provided, the latter with a scale calibrated so as to show just how the absorber should be set for different weights, ranging from 1,600 to 5,500 pounds. The ends of the arms have also been simplified, thus making the application of the shock absorbers much easier.

With the exception of the friction disks, the device is constructed of crucible steel and brass throughout, and consists of three arms of equal dimensions, two paired, and the third acting as a middle arm, all three being joined by a center stud, making the shock absorber interchangeable and reversible. The center, or middle arm, works on a hardened steel bushing giving a

1908 MODEL OF THE TRUFFAULT-HARTFORD SHOCK ABSORBER.

straight up and down movement which prevents shearing and side swaying. The inner surfaces of the lower or outside arms come in direct contact with cup-shaped brass disks, firmly secured, instead of friction washers as heretofore, while on each side of the center arm the friction disks themselves are attached. Over them is fitted a brass cup into which the friction and brass disks telescope, making the new construction dirt and waterproof. The same special frictional material which was found to give such excellent service in the 1907 model has been retained. Its construction is such that it lubricates itself automatically in proportion to the pressure, the surfaces containing sufficient lubricant to last the life of a car. The fact that no less than seventeen different American manufacturers now use the Truffault-Hartford as part of the regular equipment of their cars speaks for itself.

### CHARLEY SEVERS RELATIONS WITH MERCEDES.

C. L. Charley, who has been associated with the selling end of the Mercedes company ever since the latter began to market its cars outside of Germany, has just severed his contract relations with that firm, although he has let it be known that he will continue to assist those of his sub-agents who still have chassis to dispose of under existing contracts. M. Charley was the sole distributor of Mercedes cars in France, England and the United States, and, as such, came to be known almost as well on this side of the Atlantic as abroad.

**PERFECTED DRY CELL IGNITION ON ELMORE.**

As an inkling of one of the things they will uncover at the coming Garden Show, the makers of the Elmore two-cycle cars state they have been making an exhaustive line of experiments with dry cells as a source of ignition current, and what is far more to the point, that their experiments have been remarkably successful. For instance, they are willing to guarantee that with their improved system of ignition using dry cells, an Elmore will run 1,500 miles without replacing them, and they have on record an instance of 2,000 miles having been covered. This means that an average season's driving can be accomplished on two sets, or a dozen six-inch dry cells, with which every Elmore is equipped. More than that, the system is said to be so sensitive that it has worked successfully for several hours on dry cells that had been discarded as worthless by other users; in fact, it has continued to operate until the cells would not give a reading in excess of one ampere.

**REGARDING THE PARKWAY GARAGE COMPANY.**

According to newspaper reports that appeared last week, the Central Park Automobile Storage Company filed a list of its assets and liabilities in conformity with the bankruptcy laws, its petition having been filed and a receiver appointed in November, 1906. The receiver decided not to carry on the business and the premises at Central Park West and 110th street were accordingly leased to the Parkway Garage Company, which was involved. The only connection between the latter company and the bankrupt concern, however, is that the Parkway Garage Company is the present occupant of the former company's location. C. Herbert Covell, who is also president of the Covell & Crosby Motor Company; Richard K. Fenker, formerly general manager of the same concern, and Leslie B. Sanders, manager of the automobile department of the Fiss, Doerr & Carroll Horse Company, comprise the Parkway Garage Company.

**TRADE NEWS FROM THE QUAKER CITY.**

PHILADELPHIA, Oct. 7.—Manager W. F. Smith, of the local branch of Thos. B. Jeffery & Co., makes the announcement that the Rambler concern has again been compelled to seek additional room to carry on the business. With no less than three local establishments, a lease was signed last week whereby the large factory building at Broad and Washington avenue was turned over to Manager Smith. It is the intention of Mr. Jeffery, who came on to engineer the deal, to establish the largest and best equipped garage and repair shop in the country.

The Charles F. Johnson Automobile Company, which recently took over the local agency for the Pope-Toledo car, has engaged J. B. Dickson to manage the Broad street establishment it is about to close negotiations for.

An agency is to be established here shortly by the Imperial Motor Car Company, of Williamsport, Pa., makers of the Imperial cars.

**AN ADDITION TO LIST OF WESTERN MAKERS.**

ROCKFORD, ILL., Oct. 7.—With the incorporation of the Rockford Automobile and Engine Company in this city, Illinois is to have another automobile manufacturing concern within its borders. The new company is backed by Adam Ziska, Jr., John F. Waters and A. G. Parmele, who figure as its incorporators, the capital stock being placed at \$50,000. John F. Waters was formerly at the head of the Federal Automobile Company in Chicago, and came here a few weeks ago seeking capital to build a car which he has perfected. The type is that of the familiar buggyabout, with solid tires, the engine being placed beneath the body horizontally, and it is said to have proved very successful. It will be known as the "Rockford," will have an 8-10-horsepower motor and friction transmission.

AMBULANCE MADE BY THE RAPID MOTOR VEHICLE COMPANY.

**LATEST GASOLINE-DRIVEN AMBULANCE.**

While its line of commercial gasoline-driven vehicles has heretofore included almost every known type for business purposes, the Rapid Motor Vehicle Company, Pontiac, Mich., has recently branched out still further and are now marketing a gasoline-driven ambulance. The motor-driven ambulance has long been a familiar sight, but up to the present electric cars have been used almost exclusively. The chief feature of this new ambulance, a view of which is shown by the photograph, is its greatly increased accommodation over previous types. Entrance is by two broad steps in the rear, leading to two full-size emergency cots with an aisle between. Seats are provided for three attendants, one in the center of the aisle and one at the foot of each cot, while the driver's seat, upholstered in tufted leather, is 4 feet 6 inches wide and easily accommodates three persons.

**HARTFORD TO HAVE A HIGH-SPEED PATROL.**

What is probably one of the most advanced types of patrol wagons ever built for American municipal service has recently been turned over to the city of Hartford by the Pope Manufacturing Company. It is built on a Pope-Hartford chassis, the mechanism of which does not differ from the standard car of that type, and is equipped with a specially designed body which will comfortably seat eight persons, or ten at a pinch, in addition to the driver. One of the most valuable features of the body design is the fact that it has been made so as to be readily convertible for ambulance purposes by the removal of the benches. The tire equipment consists of five-inch Hartfords on Midgley rims, and the car is capable of making forty miles an hour.

HARTFORD'S NEW POPE-HARTFORD POLICE PATROL.

MR. HOLLINGSHEAD'S STEARNS ON PIKE'S PEAK SUMMIT.

### TO THE SUMMIT OF ZEBULON PIKE'S PEAK.

J. D. Hollingshead of Chicago, touring through the western part of the country, recently decided to attempt the ascent of the famous peak bearing Zebulon Pike's name. Start from Manitou was made with F. W. Leland at the wheel of the Stearns. It was feared at first that because of the rapid change in altitude much carbureter trouble would develop, as the top of the peak is 14,147 feet high. The occupants of the car were agreeably surprised, however, for not once was the slightest trouble encountered. The details of the climb are best told in the words of Leland: "I never met such awful roads in my life, or, to be more exact, I never before traveled on such ground without any road. At first it was all right. In fact, we were able to find the road all right as far as the Half-Way House, but from there on we were forced to run along the trail used by horses and burros in climbing the peak.

"But the worst of all was making the turns. Owing to the character of the road (?), it was necessary to back up a trifle and then go ahead, and it was very ticklish business. Meanwhile the grade was becoming something frightful, but we plugged right along. Then we came to one place that almost made the women of the party faint. It was necessary to back up a little, and as we rounded the corner, going backwards, we almost dropped over a precipice. I slammed the emergency on quick, reversed her, and opened the throttle. She picked up quickly and pulled us off the edge. After that we were mighty careful how we backed up.

"When we were about seven hundred feet of the summit the

little 'T' rail ceased entirely, and after that we simply had to force our way up over the rough rocks. The car rocked from side to side continually, but she never faltered, and in a short while we had reached the summit, the first touring car ever to make the ascent and the only machine which ever turned the trick unaided."

### BANQUET TO THE RED CLOUD "OLDSMOBILERS."

AKRON, O., Oct. 7.—Fred W. Work and C. J. Maxon, who arrived home Friday from their double transcontinental trip in an Oldsmobile, were given a banquet and reception at the Country Club Friday night, when over 50 local autoists were present. The banqueters included Tom Ralph Owen, whom Work accompanied on the New York-Florida tour of January last. Work and Maxon told of their exciting experiences on the trip, including some amusing episodes. R. E. Owen also spoke briefly of his record trip last spring from San Francisco to Los Angeles.

"Red Cloud," the Oldsmobile with which the trip from Akron to San Francisco and back through the Southwest and South to New York and return to Akron was made, has been placed on exhibition at the garage of the Akron Automobile Garage Company, and will probably be shown at the New York Automobile show. It is just as it appeared when it arrived, with the entire equipment, including revolvers, block and tackle, tools, maps, etc., and their condition shows that their presence on the car was not purely ornamental during a large part of the trip through the far West.

### THE ANNUAL FORD FAMILY REUNION.

Four pleasant days were passed by branch managers and heads of departments of the Ford Motor Company in the annual "Ford Family Reunion" at Detroit last week. There were some intervals for serious business talks, but the greater part of the time was spent in sampling the good things provided. An interesting trip was made to Pine Lake, thirty miles from Detroit, where a sumptuous banquet was served at the Automobile Club house. Wise and witty speeches were delivered by Messrs. Couzens, Hedges, Hawkins, Plantiff, Wills, Flanders, Walburn, Pelletier, Fay and other members of the organization. Congratulations went the round for the large cash volume of business done during the past twelve months—over \$7,500,000—and the record output of Ford cars. As guests of the Dodge Brothers the party enjoyed a hair-raising ride on the *Hornet*, the fastest launch on the Great Lakes, and on Saturday, at the State Fair grounds, watched Henry Ford do some fast miles on his latest speed creation. Mr. Ford drove the car himself for three miles, the last in 59 seconds, and Kudlik did three, each in 55 flat, which roused the enthusiasm of the crowd to a high pitch.

FORD BRANCH MANAGERS ENJOYING AN OUTING AT PINE LAKE, NEAR DETROIT, DURING THE ANNUAL REUNION AT THE FACTORY.

THE RECENTLY COMPLETED BARCLAY GARAGE AT MINNEAPOLIS.

#### Minnesota's Metropolis Has a New \$60,000 Garage.

MINNEAPOLIS, MINN., Oct. 4.—In the completion of the J. J. Barclay garage, Hennepin avenue and Harmon place, Minneapolis finds herself in possession of the most modern and completely equipped automobile shop west of Chicago. The building has two stories and a basement. It is constructed of white sand lime brick, concrete and iron, being not only substantial but handsome in appearance. The basement is used for the heating plant, for the charging of electric vehicles and for dead storage. It also contains a work bench for the free use of private chauffeurs. The first floor is for the offices and garage and the second for the workshop, the stock and tool room, the chauffeurs' room, the paint room, the dust-proof varnish room and salesroom.

One of the features of the new building is the workshop. This has seventeen windows and a large skylight. The work benches are of the latest design. The three pits are well lighted and ventilated from below. The dust-proof varnish room is another triumph in up-to-date garage construction, and also the chauffeurs' rest room. A 10-horsepower electric elevator runs from the basement to the top floor.

Previous to 1902 Mr. Barclay was in the land business. Seeing a good future for the automobile business, he established himself in a small shop with a floor space of less than 2,000 feet. His new garage has a floor space of 28,089 square feet. The cost of the new structure completed is \$60,000.

#### Another Link in the New York-Buffalo Chain.

AMSTERDAM, N. Y., Oct. 7.—It is evident that in the course of a few years the entire length of the route from New York City to Buffalo will be lined with modern garages at all the more important stopping points. The latest to be completed is that of William Daye, whose business outgrew the old quarters on Division street, and who has since had constructed for him a modern building on the east side of Walnut street, adjoining the Hotel Warner. The new structure has a frontage of 54 feet on Walnut street and is 108 feet deep. It is of brick and steel construction with a main floor of concrete, and is accordingly fireproof. On the second floor will be located a completely equipped machine and paint shop, which will be in charge of R. G. Daye, an expert machinist, lately with the General Electric Company. A large electric elevator is provided to carry the cars to the upper floor.

#### Springfield Boasts New England's Most Modern Garage.

SPRINGFIELD, MASS., Oct. 7.—In the establishment of the Geisel Automobile Company in this city is to be found one of the most representative and up-to-date automobile stations that New England can boast. The building itself measures 56 by 126 feet and is constructed with a trussed roof so that the floor is entirely free from obstructions. On the east side, windows are

placed between each pair of trusses and run up to the roof, giving an unusually liberal provision for lighting. Ease of entrance and exit have also been provided for by making the front door 14 feet wide, while a second door in the southeast corner is 16 feet wide. The washstand occupies a space 18 by 24 feet and is fitted with a special overhead washer capable of swinging round the longest cars. On each side of the garage floor there have been placed seven drop lights on 25-foot cords to facilitate the inspection of cars on any part of the floor. Plans are under way for the addition of an L-shaped wing to measure 50 by 90 feet, which will be used to accommodate a repair shop, and the latter will also be fitted in the most up-to-date manner. The garage is very favorably situated in the center of Springfield's business district and within a block of the railroad station.

#### Chicago Has Model Garage at Garfield Park.

CHICAGO, Oct. 7.—Though out in the suburban districts, the new Garfield Park garage at 435-437 Douglas boulevard can hold its own with anything Chicago has to offer in the way of automobile accommodation. The building measures 40 by 135 feet, facing the park part of Douglas boulevard from the west, and was planned throughout by Herman E. Halbert, its present manager, who is a graduate of bicycling days. It is a fire-proof structure and has storage capacity for forty cars; it is equipped throughout with every modern convenience, including a ladies' waiting room, steel lockers for chauffeurs and owners, overhead washers and a completely fitted machine shop for repair work. Prior to erecting the new building, Mr. Halbert was in business at 1891 Harrison street and is agent for the Cleveland cars, besides maintaining a Prest-O-Lite exchange station.

#### An Addition to the Metropolitan Garage List.

NEW YORK, Oct. 8.—Another chapter in the usurpation of the place long held by the horse took place in the recent transformation of the well-known Harriman stable building that sheltered some of the Speedway's most famous trotters into the Speedway Garage. It is located just at the head of the Speedway on 155th street, near St. Nicholas avenue. Every modern facility for storage and repair work has been installed, in addition to which a full line of supplies is carried and a renting business will be established. The place is under the management of experienced automobile men and should become deservedly popular.

#### Capitol Hill Garage in Larger Quarters.

WASHINGTON, D. C., Oct. 7.—James J. Flynn, proprietor of the Capitol Hill Garage, has leased the building formerly occupied by John R. Thomas, at 1028 Connecticut avenue, and has equipped it as the "Mitchell Garage," naming it after the Mitchell cars, for which he is agent in Washington. An electric charging plant has been installed and a line of accessories added.

GEISEL AUTOMOBILE COMPANY'S GARAGE AT SPRINGFIELD, MASS.

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

Using the assessment rolls as the source of information, it is learned that the number of automobiles in Minnesota has increased from 1,575 to 2,215 in the past year, while their value has jumped from \$697,708 to \$1,009,735.

R. M. Owen & Company, general sales agents of the Reo and Premier lines, are now established in their new headquarters at 1759 Broadway, having lately given up the old place at 40 West Sixtieth street, which had been outgrown some time ago.

It is of interest to note that in the recent twenty-four-hour race held at Morris Park no less than six of the competitors in the race itself used Vacuum oils for lubrication as well as the winner of the cross-country run. These were the Dietrich, the Allan-Kingston, Packard, Itala, Motobloc and Matheson, the other being the American Mors, driven by Owen.

John Wilkinson, chief engineer of the H. H. Franklin Manufacturing Company, Syracuse, N. Y., has just completed a motor that will run on water, though the feat may not be as wonderful as it appears at first sight, as he has merely taken a 1908 Franklin six-cylinder air-cooled engine and put it into a boat that is now the terror of all Skaneateles Lake, as it has greatly surpassed his expectations in speed.

Getting tired of being constantly passed on the road by automobiles, the Fire Department of Long Beach, Cal., decided to do likewise, and accordingly undertook exhaustive tests of different cars. A Rambler, Model 21, was purchased and fitted with chemical fire extinguishing apparatus. After some months' use of this car the town has now placed an order for two Model 25 Ramblers, which will be specially equipped for this service.

The Pittsburg Chronicle-Telegraph has just concluded a unique contest by awarding to David E. Martin, an employee of Banker Brothers Company, of Pittsburg, a valuable prize for the best list of answers to sixty-eight questions regarding automobiles and the handling of them. The queries have appeared in that paper during the past few weeks, and out of the total number Mr. Martin answered sixty-two of them correctly, in the judgment of the committee of award.

John J. Ryan, of turf fame, has ordered a new 90-horsepower Stearns runabout, and as he has recently come into the limelight as a racing driver, it is expected that when he takes the Stearns to Florida next winter, which he intends doing, he will go against everything in his class or bigger. He has been driving a 60-horsepower Stearns with great success, particularly at the recent races in Cincinnati, and has accordingly placed his order for one of the higher-powered 1908 models.

In the opinion of Charles Clifton, of the George N. Pierce Company, the postponement of the stripped stock touring car race to next spring was a wise move, as the short notice would give the makers no opportunity to prepare for the contest. Although the Pierce Company confines its attention to touring and similar contests, it is not improbable that it may

be induced to enter the field with other stock cars in the near future, provided the events be run under the auspices of the American Automobile Association.

John D. Rockefeller displays the same painstaking care and unerring business judgment in the purchase of such a small thing—to him—as an automobile as he does in his vast commercial dealings. He became the owner of a White Steamer limousine in the fall of 1905 and has used the car more or less continuously ever since, but when it came to buying another car of the same make he asked the salesman all kinds of questions, examined the car inside and out, and had a 30-mile demonstration before ordering.

At the forthcoming automobile show the N. Y. & N. J. Lubricant Company will have a practical demonstration at its booth of a transmission gear lubricated with its KOO-Special Grade non-fluid oil. Another interesting feature of the exhibit will be the presence of Miss Hebe White. Miss White, who has just completed an endurance run against Miss Phoebe Snow to see who could keep clean the longer, will distribute an attractively printed booklet, describing a most interesting cross-country automobile steeplechase.

At the start of their 5,000-mile trip in the six-cylinder Berliet, Arthur N. Jervis and F. M. Hoblitt earned for themselves the title of the "Vanadium Brothers, the Anti-Fatigue Team," due to their acquisition of twin outfits of leather and khaki as a preliminary. Their fame spread abroad, and when they reached Chicago a vaudeville manager endeavored to make a contract with them to do a "turn" in his house. He was informed that their act was "a mile-a-minute knockabout specialty, and a stage a thousand miles square was necessary to play it," which made him conclude he did not want it.

Rambler dealers from all over the continent have been flocking to Kenosha, Wis., the birthplace of all the Ramblers, during the past few weeks. It has long been the policy of the company to encourage an annual visit to the factory on the part of its representatives in order that they may become familiar with 1908 models early in the season. Among recent visitors were W. K. Cowan, of Los Angeles, and F. B. Naylor, of San Diego, Cal.; F. D. Homan, of New York; Prince Wells, of Louisville, Ky., and E. J. Filiatrault, of Duluth, Minn., all of whom went away deeply impressed with the 1908 line.

Believing comparison with a car of known quality to be the only way of judging a new one, the testing department of Thos. B. Jeffery & Son have undertaken a unique form of trying-out for their new models. A 1907 40-horsepower Rambler and a 1908 model rated at 32 horsepower have been assigned to two of the Rambler factory's most expert testers. They are now touring the sand roads and hills of Illinois and Wisconsin and will include some of the better known hills in their itinerary, such as that at Algonquin. In order to stimulate effort, a substantial prize has been offered for the winning man in the greatest number of tests, and in order to equalize matters the operators change cars every morning.

S. B. Green, proprietor of the Central Automobile Garage, Daytona, Fla., is now occupying the new building directly north of his present establishment on Magnolia avenue, on which construction was started about the middle of August. The building measures 33x50 feet, has a concrete floor and metal roof, and will be used exclusively as a machine and repair shop for automobile and boat work. It has been equipped with a complete set of machine tools for this work, and the electric lighting plant in the old building will also be moved.

The directors of the Peerless Motor Car Company met at Cleveland on September 30 and declared the usual annual cash dividend of 10 per cent. The company has been making extensive improvements and additions to its plant during the past year and regards the outlook for the coming season as extremely satisfactory. Among the buildings now in course of construction are a foundry to make aluminum and brass castings for the entire output, as well as to afford facilities for engine and chassis testing, while a second is to form an extension of the present machine shop. New factory offices and draughting rooms are also in course of construction, while considerable special machinery is already being installed.

### NEW AGENCIES ESTABLISHED.

Thomas J. Fay, chief engineer for J. M. Ellsworth, 518-520 West Twenty-second street, New York, recently closed a contract with Messrs. Derihon, of Liege, Belgium, through which Mr. Ellsworth becomes sole American distributor of the alloy steel die forgings made by the Liege plant, American receipts of which will exceed \$500,000 in value annually. This factory uses the special automobile steel made by Felix Bishoff, Duisberg, Rhine, Germany. This is one of the largest projects of its kind the year has brought forth, but further developments are expected.

"Western dealers are looking forward to a record-breaking business next year," said Horace De Lissier, president of the Ajax-Grieb Rubber Company, on his return from the West. While away Mr. De Lissier made a coast to coast trip and as a result there are now four branches handling Ajax tires on the Pacific Coast. In San Francisco Hughson & Merten will have charge as managers, and through them special branches will be run in Los Angeles, Portland, Ore., and Oakland, Cal. Charles Davis, former manager for the G & J Tire Company, will travel the Western States in the interests of this concern. A branch was also opened in Seattle, Wash., and placed in charge of Harold W. Stimpson.

The Pennsylvania Auto-Motor Company, Bryn Mawr, Pa., have arranged for agencies as follows for the season of 1908: City Hall Automobile Company, 66 Fulton street, San Francisco; Greer-Robbins Company, 1501-1505 South Main street, Los Angeles, Cal.; Denver Omnibus & Cab Company, Denver, Col.; Hamilton Automobile Company, 1257 Michigan avenue, Chicago; Frederick E. Randall Company, 245 Columbus avenue, Boston; Pennsylvania Motor Car Com-

pany, Providence; Bellefield Motor Company, 4514-16-18 Henry street, Pittsburgh; Robert D. Jones, 409 New England building, Kansas City, Mo.; Rice's Garage, Madison street and North avenue, Baltimore; West-Stillman Motor Car Company, 153 N. Broad street, Philadelphia; Chas. F. Batt, 1378 Bedford avenue, Brooklyn, N. Y.

W. S. M. Mead, manager of the eastern sales agencies of the Lozier Motor Company, has been making a round of the eastern territory, making arrangements for the Lozier representation during 1908. As a result of his trip, H. C. & D. C. Castle, Inc., Boston, will continue to represent the Lozier interests during the coming year throughout the State of Massachusetts, with headquarters at Boston, and a branch at Springfield. In Pittsburg, where the Lozier has not been regularly represented heretofore, D. P. Collins & Company have taken on the line and will handle it in connection with the Columbia, for which they are agents. The Eastern Automobile Company, Philadelphia, formerly agents for the Lozier and the Stevens-Duryea, discontinued business on October 1, and the Lozier will henceforth be represented in the Quaker City by the General Motor Car Company, who also handle the Autocar.

#### PERSONAL TRADE MENTION.

David H. Keaghey has just assumed charge of the Allegheny Automobile Company's establishment. Pittsburg, as manager. The concern will handle the Austin, Glide and Rapid trucks.

F. H. Fowler, well known throughout the New England trade, has accepted a position as special traveling representative of the R. H. Smith Mfg Co., Springfield, Mass., makers of the Springfield Motometer.

James F. Fairman has recently joined the selling forces of the N. Y. & N. J. Lubricant Company, 14 Church street, New York City, and will travel in the latter's interests, making his headquarters at the New York office.

Gaston R. Rheims, head of the C. G. V. Import Company, has returned to New York after a two months' stay in France. Before sailing on the return trip Mr. Rheims tried out the first of the new 100-horsepower C. G. V. semi-racers.

Berne Nadall, who until recently was engaged in launching the Comet Motor Car Company, Ltd., of Montreal, Can., is shortly to leave the Dominion and return to the States. He has acquired the American rights of the Gillett-Lehman controller and economizer, and will manufacture and market it in this country. Mr. Nadall will make Chicago his headquarters.

O. H. Henderson, who has been connected with the Waverley department of the Pope Motor Car Company, Indianapolis, Ind., for the past six years, until recently as superintendent of agencies, has resigned, and, while no announcement has been made, it is understood he has already become identified with one of the country's large makers of electric vehicles in a similar capacity.

James Couzens, secretary-treasurer of the Ford Motor Company, Detroit, left for the Pacific Coast on Monday of last week. Mr. Couzens goes to make his annual inspection trip of Coast condi-

tions and to plan his sales campaign in that part of the country for 1908. He is accompanied by Mrs. Couzens and will remain away from the factory about a month, during which time he will visit every city of importance in the West.

F. A. Brodhead, formerly manager and secretary of the American Automobile Company, of Atlantic City, has left the latter concern to assume the management of the Philadelphia store of the Dragon Automobile Company, of that city, becoming resident manager of the Broad street branch. Mr. Brodhead has fifteen years' experience in the selling of gas engines and automobiles behind him and is considered a valuable acquisition to the Dragon forces.

#### NEW TRADE PUBLICATIONS.

Tobin bronze, manufactured by the Ansonia Brass and Copper Company, with offices at 99 John street, New York, is very fully dealt with in a booklet issued by that firm.

The product of the Empire Tire Company, of Trenton, N. J., comprising automobile tires, repair outfits, protectors, rubber matting, etc., is listed in a booklet just sent forth.

Automobile tops, wind shields, aprons, rugs, hampers, etc., and a full line of clothing for automobilists of both sexes forms the subject matter of the Detroit Motor Car Company's latest catalogue. The address of the firm is 1256 Jefferson avenue, Detroit, Mich.

A general catalogue of machinists' tools, etc., has been issued by the Billings & Spencer Company, Hartford, Conn. It is a duplicate of the firm's general catalogue of machinists' tools, but reduced to envelope size, with wood cuts introduced in place of half-tones.

Catalogue E, 1907, from the Boston Gear Works, Norfolk Downs, Mass., is a general gear catalogue, including chains, sprockets, bearings, steering devices, etc. It is of convenient pocket size and contains, in addition to the trade matter of the firm, a series of mechanical tables.

Mechanical features and material benefits of the Kilgore pneumatic shock eliminator, made by the Kilgore Manufacturing Company, Old Town, Me., are put forth in a booklet entitled "Ride on Air." It contains illustrations of the eliminator and diagrams of vibrations with and without this apparatus.

The Piper's percentage forms the theme of a booklet from the Diamond Rubber Company relative to tire cost during the Glidden Tour. The text shows the low figure paid to the piper by Diamond users during this strenuous competition, and illustrations depict a number of contestants equipped with the Akron firm's product.

The McNutt system of safety devices for handling gasoline, naphtha and other volatile liquids is dealt with in an illustrated booklet from the Non-Explosive Safety Naphtha Container Company, with offices at 1133 Broadway, New York City. The claims are that with these devices gasoline can be handled with absolute freedom in all circumstances.

Bulletin No. 7, received from the Dayton Electric Manufacturing Company, Dayton, O., describes the firm's 8-S switch-board gas-engine ignition outfit. It is for use with stationary gas engines

used to drive direct-current power dynamos. The switch provides for charging two stor alternately from the lighting dynamo.

How Rome spiral tubing radiators and condensers are manufactured, and how the different types look when finished can be learned by the booklet published by the Long-Turney Manufacturing Company, of Rome, N. Y. Numerous illustrations are given of these vertical tube radiators, as manufactured for well-known cars and for use on commercial vehicles.

Instead of issuing a general catalogue, the George Q. Hill Company, of Boston, Mass., has produced a booklet illustrating a few of their many examples of special metal parts made to order. The firm has made the commercial production of small metal parts in quantity a particular study, their processes including turning, swaging, rolling, drawing, blanking, forming and finishing of sheet metal, wire, tubing and castings.

As a possible aid to the designer, the Briscoe Manufacturing Company, of Newark, N. J., has produced a large hanger illustrating most of the distinctive radiator designs that have been used in this country and abroad during the last six years. Those made by the Briscoe Company are produced in half-tone, the others—mostly French, German and English—are shown in outline. The same matter is also printed in pamphlet form. Copies will be sent on request.

The Diamond Chain and Manufacturing Company has issued an instructive treatise on power chains and sprockets. In addition to listing the firm's complete line of automobile, bicycle and motorcycle chains, it gives information on the manufacture and use of machined chains. A chapter on power transmission explains the advantage of chain gearing. There is a table of sprocket dimensions and practical hints on how to get the best service from chains. A copy of the booklet can be obtained from the Diamond Chain and Manufacturing Company, at Indianapolis, Ind.

The instruction book for the guidance of operators of 1907 Peerless cars deals with its subject in a most commendable manner. Each part of the machine is described briefly, but clearly, and valuable information given on the manner of caring for and operating the car. By means of half-tone illustrations and carefully prepared line drawings it is possible to follow clearly the instruction given and arrive at a thorough understanding of the machine. Operators of Peerless machines will find it a useful book to consult. It can be obtained from the Peerless Motor Car Company, Cleveland, O., or from their selling agents.

There is interesting reading in the publication issued under the title "The Truth About the Automobile." The Cadillac Motor Car Company, of Detroit, Mich., has endeavored to obtain accurate data on three important points: The life of an automobile, the number of miles it will run on a gallon of gasoline, and the length of time the tires will wear. One hundred and fifty-eight records on these points, sworn before notaries and witnesses, have been obtained and are now produced. In addition, a tabular record is given of cost of repairs, mileage, gasoline consumption and number of passengers carried of 164 single-cylinder Cadillacs.

INFORMATION FOR AUTO USERS.

**Electric Gas Lighters.**—For lighting automobile headlights or other acetylene or coal gas lights, the Adjustable Burner Company, 18 Pearl street, Newton, Mass., is placing on the market a simple

ADJUSTABLE ELECTRIC GAS LIGHTER.

electric gas lighter which can be readily applied to any burner. It is operated by dry cells or other battery current and a plain spark coil, which can be installed by any autoist, as no particular knowledge of wiring is required. The lighter is practically indestructible, as all springs and working parts are out of the way of the flame when the burner is lighted. The lighters alone list at 50 cents each and their construction may be seen from the accompanying illustration.

**Comanche Automobile Whistles.**—The Comanche Whistle Company, 335 South Spring street, Los Angeles, Cal., is putting on the market a line of automobile, mo-

THREE SIZES OF COMANCHE WHISTLES.

torcycle and motorboat whistles of attractive appearance and simple mechanism that have met with considerable favor on the Coast right from their first appearance, and are now being introduced in other parts of the country. The Comanche whistle is blown by the exhaust from the motor and is operated by a neat bronze pedal, the note being produced by changing the position of the plunger in the barrel of the whistle.

When fully open a very low note is produced, rising on the scale until the blast is shut off entirely and having a range of about an octave and a half. No cut-out is required, a spring shutting off the exhaust when the pedal is released. The whistles are constructed throughout of polished brass and are made in three sizes, the small and medium types for cars having a free exhaust, and the large one for cars on which the exhaust is under more or less pressure. For motor boats they are correspondingly simple, no storage tank or pump being necessary, while the blast produced is audible for two or three miles. In addition to forming a very necessary part of either a boat or car as a signal, simple airs may be played with a little practice.

**The Old Knick Timers.**—These timers, made by the Pioneer Brass Works, Indianapolis, Ind., are constructed with an aluminum case, 3 1-2 inches in diameter, insulated with a 3-16-inch sheet of fiber back of the contact spring and by means of a sheet of mica between the fiber and case. The timing head is of phosphor bronze, while the spring is of the best oil-tempered steel, held in place by phosphor-bronze binding posts. It is further insulated through the case by means of a large fiber washer held in place with both lock and terminal nuts on the binding posts. These timers are made for any type of engine and for any number of cylinders, and are the result of a number of years' experience in the building of gas engine accessories. It is a matter of common knowledge that half the petty troubles arising from the ignition system may be traced to poor contact at the timer, so that it is always worth while to buy the best that is to be had where such an important essential is in question.

OLD KNICK TIMER WITH COVER REMOVED, SHOWING MECHANISM.

**Extra Tonneau Seats.**—The Graves & Congdon Body and Seat Company, Oak street, Amesbury, Mass., who manufacture a line of automobile bodies, are now placing on the market a detachable tonneau seat which is an improvement over many of the types hitherto in use, in that it cannot only be easily folded up or removed from place when not in use, but it leaves no unsightly attachments after removal. It is a revolving seat, and the bracket by which it is at-

G. & C. REVOLVING CHAIR SEAT.

tached to the side of the tonneau is of dove-tailed construction. Two sizes are furnished, either in the white or finished. The accompanying illustration pictures the seat both ready for use and in the folded position. They are not only attractive in appearance, but are well upholstered and very comfortable.

**Skiddoo Soap.**—Most any soap takes off the surface dirt and that is all, say the makers of Skiddoo soap, the Brown Soap Company, Columbus, O., but Skiddoo soap takes off all the dirt and the stain as well. It is put up in tins in a convenient paste form and may be easily used as desired without any danger of harming the skin. Aside from toilet uses, for which it is absolutely guaranteed by the makers to remove "all the dirt," it is also useful for cleaning and polishing the lamps or other brass parts of the machine.

# THE AUTOMOBILE

VOL. XVII.

NEW YORK—THURSDAY, OCTOBER 17, 1907—CHICAGO

No. 16

## Chateau-Thierry's Climb

### Has many entries and a Pipe winner

PARIS, Oct. 7.—Every year somebody prophesies that Chateau-Thierry hill climb will not be held again, and every year more automobilists than ever before cover the forty miles separating the quiet town on the hillside from the capital. This year there were seventy-three actual starters in a multiplicity of classes from small motorcycles to Grand Prix racers.

An Albatross motorcycle, fitted with an Anzini motor and mounted by Olieslaegers, the "Red Devil" of Antwerp, furnished the fastest speed of the day by climbing the mile hill at the rate of 53 miles an hour—splendid going on a 10 per cent. damp grade with two bad turns. Jescpers, on the Pipe, built for the German Emperor race, made the fastest time of the cars, climbing the hill at an average of fifty miles an hour. In this class reserved for German Emperor racers, Hemery, on a Benz, came second, with Rochet-Schneider third and fourth, and Minerva fifth.

Darracq captured first and second places in the Targa Florio class, with H. I. S. A. second and La Buire third. When the machines were examined after the run it was discovered that the second Darracq, the machine which won the Sporting Commission Cup at Dieppe, had not a gasoline tank in accordance with the regulations and disqualification was imposed.

In the unlimited racer class Rigal's Grand Prix Darracq made the third fastest time of the day, easily beating an Aries, its only competitor. Rigal's "mechanic" was Mlle. Polaire, a the-

atrical artiste. Barriaux and his Vulpes had the votturette racer class to themselves and made the moderate time of 1:21 3-5.

An unfortunate accident marked the trials of the racers, as the result of the overzealousness of a member of the fire brigade on duty on the road. During the motorcycle races the military fireman stepped on the course to watch the arrival of the machines. He was surprised by the rapid approach of a motorcycle mounting the hill at sixty miles an hour, and to save himself rushed to the inside of the turn. To avoid a collision the motorcyclist ran wide, missed his turn, and struck a soldier standing on the edge of the course. The unfortunate man was hurried to the hospital and given every attention, but died a few hours later, his death being the first of any spectator at an automobile meet in France since the ill-starred Paris-Madrid affair.

The owner of the Fiat, with which Nazzaro won the German Emperor's Cup and which was engaged to be driven by Bordino, Lancia's mechanic, withdrew at a late hour owing to the machine not being assured against accident.

Paul Faure's 1906 Grand Prix Mercedes racer, which, being equipped with a full side entrance body, was allowed to compete as a touring machine, made the fastest time of the fifty-three touring cars, mounting the hill in 1:14 3-5. Berliet, Aries, Mors and Motobloc followed in this order. In the 140 millimeter class a Gladiator, which took part in Paris-Berlin in 1901, was

READY FOR START ON UNEVEN COBBLESTONES.

BELGIAN PIPE WHICH MADE THE RECORD ROMP.

third fastest of all classes, and first in its own series. Generally the going was good in all the tourist sections, last year's times being slightly exceeded.

The most interesting feature of the tourists was the work done by single-cylinder voituertes, a class of vehicle which has come to the front in a remarkable manner during the last two years. The fastest time was made by a 4.8-inch bore Lion-Peugeot; Sizaire & Naudin got two first places in the less than 4.8-inch bore class, and a couple of Demeesters made fast time in the 3.9 bore class. All these little machines were fitted with magnetos, Nilmelior predominating. Nothing extraordinary was done by the smallest four-cylinder runabouts, but the class with bore limited to 3.9 inches did some interesting work, Regini-Dixi coming first in 2:13.5, followed closely by a La Buire, a Darracq and a Werner, this latter well handled by a lady. Judging from this meet, French manufacturers have fully understood the importance of small low-priced automobiles and have provided a class of vehicles which should more than meet all local requirements. With a few exceptions large makers have not entered the field, the voituertes being constructed by newly formed firms, organized by men who have broken away from the large factories.

#### CHICAGO A. C. DECLARES COEY WINNER.

CHICAGO, Oct. 14.—The special committee appointed by the Chicago Automobile Club to investigate the protest of Paul Picard in reference to the 24-hour race of July last, in which C. A. Coey, driving a Thomas, was the winner, has compiled and issued its voluminous report of the investigation. The report is signed by Sidney S. Gorham and Norton H. Van Sicklen, and this paragraph practically tells the story:

"After a careful study of the evidence as reduced to writing by the shorthand reporter, the members of your committee are unanimously of the opinion that no sufficient showing has been made to justify the belief that the award to the Thomas car was not properly made, but that on the contrary it affirmatively appears from the evidence that the scoring was honestly performed, and that, allowing for possible unintentional errors and omissions, the official score shows the correct mileage."

#### QUAKER CITY'S 1908 ENDURANCE RUN.

PHILADELPHIA, Oct. 14.—After its arduous campaign of the present year, the contest committee of the Quaker City Motor Club is already at work on the details of its annual New Year endurance run, which is scheduled for January 1-2 next. The route selected for the run is via Willow Grove, Doylestown, Easton, Nazareth and Bethlehem to Allentown, where the overnight stop will be made, returning home next day via Kutztown, Reading, Pottstown and Norristown, a distance of about 200 miles.

#### THOMAS AND RENAULT WANT A 24-HOUR.

The announcement has just been made by the E. R. Thomas Company of its intention to permanently withdraw from circular track racing. Before doing so, however, E. R. Thomas declares that he is anxious to see settled the twenty-four-hour supremacy by a special match between the Thomas, the Renault, and the Fiat, victorious in the three contests held this year in the metropolitan district, at Brighton Beach and Morris Park.

At the last Morris Park contest Paul Lacroix challenged the winner of that event and the Brighton Beach race to a special test. E. R. Thomas responds by declaring on what conditions he will meet the foreign champions. The cars for the final twenty-four-hour race—so far as the Thomas company is concerned—shall be the Thomas, winner of the Brighton Beach contest; the Renault, holding the Morris Park record, and the Fiat, winner of the last race held on that track. The race shall be held on the track best suited for the contest, its selection to be left in the hands of the representatives of the three cars. Montagu Roberts would doubtless be one of the drivers of the Thomas car; Paul Lacroix and Maurice Bernin would handle the Renault again.

To THE AUTOMOBILE representative Paul Lacroix said: "I am prepared to meet the Thomas and Fiat in a special match, using the machine which Bernin and I handled in the Morris Park race of September 6-7. I have no restrictions to make regarding the nature of the contest or the cars which shall take part, and am willing to agree to date and place suitable to the others. Bernin and I will drive again, and we shall use the same car as before."

Manager Fosdick, of the Hol-Tan Company, whose machine won the last twenty-four-hour race, declares that he does not see how the match is possible with Mr. Thomas's restriction that the same cars be used. "Although still selling Fiat cars and possessing the one victorious in the last race, we have nothing to gain by entering in such a race in view of certain changes which are pending in the Fiat representation. Mr. Thomas, who must be aware of these changes, knows that his challenge is useless, for even the new Fiat company is unable to accept it unless it buys the winning machine from us. We are willing to sell."

#### CHICAGO CLUB HOLDS NINE-EVENT MEET.

CHICAGO, Oct. 14.—Nine events were run in the fall meeting of the Chicago Automobile Club, at the Harlem track, Saturday. The half-hour race, reduced from one hour, was won by a 20-horsepower Cadillac, with 23 3-4 miles. Apperson Jack Rabbit was second, Mitchell third, Tichner fourth, Ford fifth, Pope-Toledo sixth. The Stearns, when traveling fast, went through the fence, with considerable material damage, but without injury to the driver or mechanic. Previously, the same Stearns won the ten miles free-for-all and the pursuit race for stock cars. The five-mile members' race was captured by a 20-horsepower Stoddard-Dayton, a Cadillac got the five-mile race for runabouts listing at \$3,000, and a Ford won in the three-mile for cars listing at \$1,500 or less. C. W. Van Sicklen won the ten-mile open and the ten-mile handicap with his Indian motorcycle, as well as the three-mile open motorcycle event.

#### IMPORTERS' AUTOMOBILE SALON ACTIVITIES.

The Importers' Automobile Salon believes in the worth of automobile racing, and it has addressed a letter to the Racing Board of the American Automobile Association asking for cooperation in the adoption of a standard formula for the determination of horsepower. The communication, furthermore, says "that it is the reasonable expectation that the committee of the Salon have at least one member on the A. A. A. Racing Board."

Commenting upon racing on circular tracks originally intended for horse racing, the importers consider that nothing less than a mile course should be used and even this should be banked at the turns, sufficiently oiled, entries to be limited to a safe number and other precautions taken.

## NINE FOR AMERICA'S FIRST BALLOON RACE

ON the afternoon of October 21 the second race for the James Gordon Bennett Aeronautical Cup will be started at St. Louis, with representatives from America, France, Germany and England as contestants. Twelve months ago the first race for this trophy, and really the first international balloon race ever held, was started from the Tuileries Gardens, Paris, Lieutenant Frank P. Lahm and Santos-Dumont representing America against complete teams from France, Germany, England, Belgium, Spain and Italy. Lieutenant Lahm won by a journey to the north of Yorkshire, England, and, in accordance with the deed of gift, the second race had to be competed for in this country.

This year only four nations will compete for the trophy, America having three balloons, Germany three, France two, and England one. Owing to an attack of typhoid fever while on military service in France, Lieut. Lahm, last year's winner, has been unable to take part in the second contest. His place has been taken by Major B. Hersey, who acted as his companion in the first race, using the balloon *United States*, of 2,100 cubic

team consists of Oscar Erbsloh in the *Pommern*, of 2,200 cubic meters; Captain Hugo von Abercron and Hans Hiedemann in the *Dusseldorf*, of 2,250 cubic meters, and Paul Meckel in the *Tschudi*, of 1,300 cubic meters, the smallest of the fleet.

Despite the smaller number of contestants it is expected that the second race will equal the first in popular and sporting interests, St. Louis having special advantages as starting point on account of the opportunities it offers for long voyages in any direction. Ordinarily the wind at this time of the year blows from the southwest, so that the balloons would be carried in a northeasterly to easterly direction, probably passing over the Great Lakes and descending in distant parts of Canada. It is confidently expected that the world's long distance record of 1,203 miles from Paris to Korostychew, Russia, established by Comte de La Vaulx in 1900, will be eclipsed.

Extensive preparations have been made by the Aero Club of America for the starting of the competitors at St. Louis. The gas supply is declared to be excellent, arrangements have been

"No. 18," SANTOS-DUMONT'S MILE-A-MINUTE HYDROPLANE, UNDERGOING TESTS ON SEINE PRIOR TO FITTING ENGINES.

meters capacity. Augustus Pope will accompany Mr. Hersey. J. C. McCoy and Captain Charles De F. Chandler will complete the American team with the *America*, of 2,200 cubic meters.

The Aero Club of Great Britain has selected Griffith Brewer and Claud Brabazon, with the balloon *Lotus II.*, of 2,150 cubic meters, as their team. The balloon used is the one piloted by Santos-Dumont in last year's race, and has since been revarnished and repaired. At that time it was fitted with a small engine driving a propeller to assist it in rising and so economize ballast.

France has Alfred Leblanc and M. Mix, and René Gasnier and Charles Levée, using the balloons *Isle de France* and *Anjou*. The Frenchmen have all had long experience in the aeronautical world and are looked upon as formidable competitors. Germany's

made by which the balloons can be started at intervals of five minutes and the use of troops has been granted to protect the enclosure. Each contestant will carry with him a delicate and accurately-made barometer, capable of recording every movement of the balloon. These will be sealed in such a way that it will be impossible to tamper with them, the reason for this being to prevent any competitor coming to earth and continuing his journey later. Conditions of the race are that the winner shall be the one making the longest flight without coming to ground.

In addition to the Gordon Bennett trophy to be held by the winner for one year, a prize of \$2,500 in cash is offered to the most successful pilot; the second man will draw \$1,000; third place, \$750; fourth place, \$500; and fifth place, \$250.

## SANTOS-DUMONT'S MILE-A-MINUTE CRAFT

PARIS, Oct. 7.—Santos-Dumont's mile-a-minute craft has been baptized. News of its first dip in the Seine having been well announced in automobile and aeronautic circles, a big crowd invaded Neuilly in expectation of interesting developments. They were somewhat disappointed, for the first test was merely

a stability trial, the hydroplane being in the tow of Vedrine's fast motor boat *Lorraine*, and without its motor or its pilot. As the workmen were placing the light shell in the water one of the small cigar-shaped floats struck the sharp pointed end of a stake and collapsed like a pneumatic tire. Half an hour later

a patch had been placed on the rubber cover, Santos-Dumont had inflated the cover with his mouth, no pump being handy, and the hydroplane was floating lightly on the placid Seine. A rope from the framework of the hydroplane was passed up to the *Lorraine*, a turn of the cranking handle given and the 100-horsepower craft moved down stream with the light hull in tow. Its stability seemed to be perfect, and as soon as a speed of 20 miles an hour was attained the three cigars rose completely out of the water, allowing the apparatus to glide.

Santos-Dumont took his place on the bicycle saddle at the

stern of the long cigar on the second day, grasped the automobile steering wheel and gave orders to the crew of the *Lorraine* to go ahead. Despite the extra weight the hydroplane behaved well, rising out of the water as soon as a little speed was attained and glided over the surface with but a slight ripple in its wake. The three-bladed propeller at the forward end of the craft was in position, but the 120-horsepower Antoinette motor had not been fitted. These initial experiments having been satisfactory, the engine will be placed at once and tests of *No. 18* under its own power made in a very short time.

## WINNING THE FRENCH BALLOON TROPHY

PARIS, Oct. 7.—At noon a warm autumn sun illuminated the gilded gates of the Tuileries Gardens, cast shadows around the nineteen swelling gas bags encircling the pond where goldfish make their home, and called out Parisians in thousands to watch the start of the third balloon race for the Grand Prix.

At 3 o'clock menacing black clouds rolled up from behind the Louvre, hesitated an instant, then descended in a deluge. As if by enchantment one hundred and fifty thousand umbrellas appeared on the Place de la Concorde and in the Garden; fifty thousand unfortunates uttered an exclamation of disgust, then prepared to take their wetting stoically. Among the competitors an eye was cast at the bags of sand and rapid calculations made on the number which must be sacrificed at the start.

Since dawn the company of military aeronauts and officials of the Aero Club of France had worked at the installation with such success that promptly at 4:30—the advertised hour—the first balloon drifted slowly upwards and was followed at regular intervals of four minutes by another aerial mass. Automobiles never answered the call of the starter with greater punctuality.

Owing to some stupidity on the part of the railroad authorities the only Italian balloon went astray; consequently none but Frenchmen competed for their national trophy, among them being some of the most experienced sky pilots the country has produced. *Aero Club II* was dragged up to the starting line with Lucien Lemaire in charge, his wife as assistant, and a couple of male helpers. But it was too much of a load for the 1,500 meters of gas and one male had to climb out of the wicker

basket, Madame remaining and smiling agreeably to the cheers which greeted her departure. The *Abeille* took two ladies in its somewhat restricted body; the *Escapade*, with Leon Barthou, brother of the Minister of Public Works, at the helm, had Madame Lafaurie as member of the crew.

Although the rainstorm passed off there was a lot of work to be done on the sacks of ballast. Some of the idlers on the Place de la Concorde objected to the sand coming down, and ladies within the enclosure shrieked as an unopened bag dropped into a pool of dirty water at their side.

At 6 o'clock nineteen balloons were in the air, nineteen drag ropes were being prepared to be cast out, and the entire aerial army had cast a look at the life belts—for the wind was driving the entire battalion seawards.

M. Delobel, piloting the *Nord*, secured the third year's aeronautical Grand Prix by a descent in the North Sea, twenty-eight miles from Ostend, and about one hundred and seventy miles from Paris. Almost before the crew could obtain a knowledge of their position, for the *Nord* had been floating far above the clouds, the balloon was traveling at twelve miles an hour over the sea. Three steamers were in sight, a rapid descent was made, the guide road was seized, the crew dragged on board, and the *Nord*, relieved of its weight, sped skywards to descend later in England. Delobel had won the Grand Prix with an ample margin. Eight others dropped down on the coast line between Calais and Dunkerque, and the rest, after being drenched to the skin, slid down to earth with shorter mileages.

## DIRIGIBLE DOINGS OF THE CLOUD WAGONERS

### ANOTHER UNIT FOR FRENCH DIRIGIBLE FLEET.

PARIS, Oct. 7.—Another dirigible balloon, to exceed the *Patrie* and the *Ville de Paris* in size, is announced for next spring. This powerful addition to the French fleet of dirigibles will be known as the *Bayard-Clément*, all expense in connection with its construction being borne by M. Gustave Clément, the well-known automobile constructor. M. Capazza, one of the most experienced of European aeronauts, has been charged to design and construct the new balloon, and has taken up temporary headquarters at the Bayard-Clément factory, where a model has been made and preliminary work undertaken. As the balloon will have a capacity of 5,000 meters, actual construction cannot begin until the special shed is ready. A couple of Bayard-Clément motors taken from racing machines will be used.

### AIRSHIP COMPANY INCORPORATED IN NEW YORK.

The American Airship and Balloon Incorporation has recently been incorporated under the laws of New York with a capital of \$200,000. Israel Ludlow, director of aeronautics at the Jamestown exhibition, declares that a large part of the capital has been paid in and that several members of the Aero Club of America have taken stock. Charles A. Strobel is president and M. R. Nock and J. C. Mars are directors.

### JONES AEROPLANE MAKES THREE FLIGHTS.

BATH, N. Y., Oct. 14.—Three successful flights, one of 200 feet, one of 600 feet and another of 1,500 feet, have been made by the heavier-than-air flying machine, designed and constructed by Charles Oliver Jones, a member of the Aero Club of America. The aeroplane, which weighs 375 pounds, with its seven-horsepower Curtis motor and one operator on board, was started from a special launching car designed to give it the necessary momentum. The flights were made at a height of about twenty-five feet from the ground, and at the end of each the machine was brought to earth without any difficulty or any damage to the structure. G. H. Curtis was in charge of the operations and directed the ground work.

### GROWTH OF AERO SOCIETIES AND JOURNALS.

There are now thirty-nine aeronautical societies or clubs in various parts of the world, four of them being in America. There are fourteen aeronautical journals in existence, six being published in France, two in England, and one each in Germany, Austria, Belgium, Italy, Russia and Switzerland. The American addition to the list appeared last July under the title *American Magazine of Aeronautics*. It is edited by Ernest La Rue Jones and published at 142 West Sixty-fifth street, New York City.

# "Trapping" Near New York City

by One Tourist

CONDITIONS which have prevailed adjacent to the metropolitan district during the past summer and early fall in the matter of overzealous country constables have well nigh taken the pleasure and enjoyment out of automobiling throughout this territory. It is reported from some sections that no more "trapping" will be done this season, and it would be glad tidings to all users of cars if this should be the case in all directions out of town. These fine autumn days when a man takes his family out for a day's spin to enjoy the gorgeous foliage, it certainly would enhance the pleasure to feel that security which is essential to a thorough enjoyment of an outing.

Unfortunately the average automobilist, though he be ever so careful of the safety of his passengers and considerate of fellow-users of the highway, is made to suffer for the sins of the very small percentage of drivers who have the speed mania in aggravated form. In ninety-nine cases out of a hundred the reckless driver gets away and the careful driver is caught to expiate the sins of the former.

Take, for instance, the trap which has been in operation for the last four Sundays at Merritt's Corners, about two and a half miles above Briarcliff Manor on the State road to Lake Mahopac. This is a favorite Sunday run for New Yorkers. On approaching Echo Lake, there are a few moderate curves; these are posted with danger signs warning one to slow down to four miles an hour. A short distance beyond Echo Lake is Merritt's Corners, where the State road crosses an infrequently used dirt road. An old stone taven, nearly a hundred years old, is on one corner, a barn on the other. Here is where the most atrocious trap in the history of this summer's many aggravated cases is located. The first two Sundays, the speed allowed was only four miles an hour, though there is no curve at this exact point and the law demands that speed only on sharp curves. Almost everyone was halted and brought before a justice, who held court under a convenient tree by the roadside. Everyone was "soaked" \$5, an ingenious amount, as the "justice was perfectly aware that no one would bother about fighting the case and would rather pay such a small fine. Seeing how easy it was to work this game, the fine was raised to \$10 on the third Sunday, but in return the limit at the crossroads was also raised to ten miles an hour, and court was held in a barn instead of in the open. Now this would not seem so very unreasonable, even if a demand for such a reduced speed was justifiable, but the trap measures only 132 feet in length and north bound travel is down grade, besides being laid out just around a slight curve. Nine seconds for the passing through this distance equals ten miles an hour. The length of the trap, the shortest on record, is equal to the length of ten or twelve cars put end to end. Naturally it makes

Merry Villagers

"Judge" waiting!

In the Toils

Line of Victims

A SCENE IN THE LAKE MAHOPAC COUNTRY.

a considerable difference, in such a short distance, what part of the car, the front or rear, is timed in passing the marks at each end of the trap; also the giving of the signals take up time which, though probably very short in itself, may make the distance actually timed many feet less than the length of the trap. Nevertheless, tourists were held up for passing the trap in 8 1-2, 8, and 7 seconds. The arresting constable was not sworn, but merely stated that the stop watch showed so many seconds and no defense was valid, though in one instance, a lame man, using two canes, swore that a certain car kept with him through the trap.

The lack of necessity for this trap and the high-handed treatment received finally drove two arrested autoists to refuse to pay the fine and to demand trial. Cash bail was furnished and

the cases were set for Monday last. Although the Justice acted in the dual capacity of attorney for the people and judge of the court, he was obliged to decide the case against himself. The evidence showed that the trap was inaccurately measured, the time inaccurately taken, that the constable received a fee for each arrest in addition to his salary, that the course laid out was not within an incorporated village, that the houses were more than 100 feet apart, and that the measured trap was not on a curve.

### GERMANY WILL PROPOSE DRASTIC SPEED LAW.

BERLIN, Oct. 12.—Members of the special automobile commission representing various Government departments intend to propose radical measures to eliminate speed-crazed automobilists. Among the recommendations which they will bring up at the conference to meet in Berlin at the end of the month is one for the use of a special speedometer, which will register speed attained by hour and for intermediate periods, in such conspicuous figures that they can be read by persons outside the car. At night the figures will be sufficiently illuminated to be read on the street. The apparatus, which, in the opinion of the commission, should be compulsory on all automobiles, shall be so constructed and arranged that it cannot be tampered with. By its use it will be possible to ascertain at what speed a car has been traveling at any time during the preceding twenty-four hours.

## LATEST NEWS CONCERNING "THAT STOCK CAR RACE"

From the New York "Herald," October 12.

When the demand of the American industry for a stock car race became so pronounced early in the fall as to be unmistakable to every automobilist and to every automobile organization except the American Automobile Association, the Supervisors of Nassau County, L. I., came to the rescue, with an offer of a circuit for the proposed contest.

Failing a movement on the part of the A. A. A., a special organization was called into existence for the promotion of the race. Then unexpectedly some mysterious influence was brought to bear upon the Nassau Supervisors, and the use of a circuit that at first had been invited was peremptorily declined.

That action so angered manufacturers, dealers and others interested in the proposed contest that they immediately began to look elsewhere for an available course for an international stock car race in the spring. T. Francis Moore, who had been prominent in the Long Island negotiations, was commissioned to search for a suitable circuit, with the one injunction that it must not be on Long Island.

As the result of that search a committee representing the metropolitan automobile trade yesterday drove over and practically agreed upon a circuit in Westchester county. That circuit, the exact location of which is withheld by request, is forty-two miles in length, has fifteen turns, a majority of which are so gradual that they may be taken at thirty miles per hour, and only one steep hill. Of this route thirty-eight miles are of excellent macadam, and six miles are of fair dirt. Included in this stretch is one mile of poor road that will need to be improved. The circuit passes through two small towns where it would be necessary to establish controls.

The general scheme of the race, which, it is said, has met with the approval of representative manufacturers, is to hold a contest of five hundred miles on a single day, probably on April 20, open only to stock chassis as regularly built and catalogued.

For this race a trophy of considerable value has been offered by a prominent sportsman. An organization, of which the Metropolitan Automobile Association is to be the nucleus, is to be perfected for the promotion of the event. Any receipts over and above the cost of promotion will be given to a charity in Westchester county.

The actual control of the race is to be vested in a committee, of which Robert Lee Morrell, former chairman of the Vanderbilt Cup Commission, will be the organizer and chief. Job E. Hedges, counsel for the American Motor Car Manufacturers' Association, will head the Legislative Committee. To John McCullough, formerly chief of police of New York, is to be entrusted the arduous duty of properly guarding the course during the race.

Prominent officials of Westchester county are said to favor the scheme, and the residents are eager for the race.

From the New York "Times," October 13.

The latest scheme for promoting an automobile road race, although heralded with much enthusiasm by some of the charitably inclined organizers who profess a deep anxiety to come to the rescue of the American industry by offering a real test for stock cars, is likely to come to a more ignominious end than was the fate of the recent attempt to hold such an event on Long Island. Ever since the failure to secure the race for Long Island roads efforts have been made to obtain a suitable course in either Westchester or Dutchess counties. In these schemes Thomas F. Moore has been the prime mover, and in view of the fact that he took an important part in the Long Island race efforts as an officer of the Metropolitan Automobile Association, which made a request for the use of the roads, the impression has become more or less general that this organization was still working to obtain a suitable course for the race next spring. It was ascertained yesterday that no official recognition to these latest road-racing schemes have been given by the Metropolitan Association.

Mr. Moore publicly announced several days ago a vague plan of a proposed race, stating at the same time that Robert Lee Morrell and Job E. Hedges had consented to assume important duties toward making the event a success. Moore has quite a knack of raising a "breeze" with his announcements, and when this last one came only a few of the misguided gave it serious attention.

Had there been the slightest indication that any representative manufacturers were directly interested in the race or that any really serious efforts were being put forth by even a small coterie of automobilists it would have been possible to have given accurate information concerning the course several days ago. It can be stated, however, for the information of those who may have imagined that there was the slightest possibility at the present time for securing such an event that the proposed course covered a circuit of nearly forty miles, starting at Briarcliff Manor. It had also been announced that D. B. Plummer, proprietor of Briarcliff Lodge, was to offer the trophy costing several thousand dollars.

"I never made any offer to put up the cup," he said. "Personally, I have very little faith in its success, and I don't believe the race will ever be held in Westchester county."

In addition to Mr. Plummer, the heads of a large wine importing firm and a whisky firm are also said to have promised to offer cups.

From the New York "Times," October 15.

Unanimous and hearty sentiment for a stock car road race was expressed yesterday at the meeting held in the Hotel Astor of representatives of about twenty automobile manufacturers, including both American and foreign machines. As a result of the meeting and the general interest manifested so unmistakably in the project, the possibilities for successfully holding such an event may be said to have taken a long step forward.

DECORATIVE SCHEME THAT TRANSFORMS GRAND CENTRAL PALACE INTO A DREAM OF ART.

STUDENTS of automobile building, as well as intending purchasers, have watched with interest the phenomenal growth of the American Motor Car Manufacturers' Association, the organization sometimes called the "Independents," which from the fifteen members of three years ago is now at the front of all similar trade associations with a membership of fifty-one of America's leading automobile manufacturers. Interest in the work of the association is particularly keen at this time owing to its participation with the Automobile Club of America in the Eighth Annual Automobile Show, which opens in the Grand Central Palace October 24, and at which show the members occupy almost all of the main floor space.

As far as can be ascertained from reports received at this time, it is estimated that the members of the A. M. C. M. A. will in 1908 make about 37,000 cars, or more than 60 per cent. of America's automobile production, with a selling valuation of something over \$55,000,000. The spirit of the Association is to further the interest of the sport of automobiling; increase the use of automobiles for commercial, professional, and pleasure purposes, and assist the common interests of its customers as well as its members. The makers holding membership conduct their business independently of each other and are not restricted as to the volume of their business; the price at which they sell their cars, or in any other way.

The one great aim of the A. M. C. M. A. is to bring about benefits and offer guidance to its members that they may turn out the best cars at the lowest possible cost, with the ultimate object of being able to supply these cars to the general public at prices within reason and yet permit of a fair margin of profit. In the manufacture of automobiles, safety and comfort are the first essentials, with the price the next consideration. When all this can be combined so that the maximum of quality can be given for the minimum of price, the trading is certain to be satisfactory to buyer and seller.

The aims and purposes of the American Motor Car Manufacturers' Association are to arrange for suitable exhibitions of its members products; to conduct race meets; to increase the interest in the purchase and use of motor cars; to secure desirable rates of transportation and shipment for machines made by its members, and for people who buy them; to furnish agents full information regarding trade in motor cars, the new forms of construction, the merit of the car itself and the developments in general; to promote public interest in good roads in every way possible and to oppose inimical legislation. Also to further the exchange of scientific information by the constructing engineers of the

various companies with a view of improving the manufacture and standardization of motor cars.

Just now the greatest work of the Association is in connection with the show at Grand Central Palace, for, besides having the preferred space, experts are engaged to describe their products in detail to the public; books are distributed telling of the work of the Association and why buyers should purchase the cars made by its members and a number of other similar conveniences for the visitor.

Not the least important work undertaken by the Association this year was that of securing the use of docks for gasoline vehicles. A member of its Freight and Transportation Committee appeared before about seventy of the freight agents, and subsequently secured the endorsement of the insurance companies and a record of their work, so that gasoline vehicles are now allowed on more than half the docks of New York,

with the others fast coming into line. This has been of tremendous benefit to those who manufacture commercial vehicles, and who up to this time have been handicapped in selling to business concerns that use the docks.

The foreign representative, A. E. Schwartz, has this year been of decided benefit to the members, bringing over in July much valuable information regarding foreign trade, besides closing the agencies for a number of important lines including axles and bearings. The compilation of automobile agents and dealers, has been another good work of the A. M. C. M. A. Another important matter which has received attention, is a uniform guarantee that is liberal to the buyer and fair to the maker. Advertising advice and plans; work for a national law providing for a single license number good in every State, and of course, the perennial question of good roads, have all supplied work for committees well versed in those subjects. Much hostile legislation has been opposed this year, including some proposed bills, which, if passed, would have seriously decreased interest in automobiling and have proved a decided setback.

One of the greatest works of the association is the publicity department under the management of Leon Myron Bradley. This department disseminates authentic information to the daily newspapers and trade publications, furnishing them with photographs of new models, mechanical specifications of the members' cars, prepares timely articles on important subjects, such as legislation, good roads, etc., and prepares exclusive stories for the various periodicals upon request. During the past summer the work of the publicity department has been broadened to a large extent and the results actually accomplished for members have been commendable.

The matter of liability insurance, freight rates, larger and more freight cars, and similar work, has been the subject of much work on the part of the association.

Importations have fallen away so much during the past year, that this did not take up as much time as usual, but it has been given the thought it deserved, and members have been informed of the cars brought from the other side.

Efforts to form combinations in various lines that might result in advancing the price of automobiles, have been bitterly opposed. The formation of the Ajax-Grieb Rubber Company; the opposition to the proposed pool of steering-wheel makers and of the combination of steel frame makers, have all worked out well for the members and for the buyers of cars. The tips that the association has given its members on the supply market have been extremely valuable, particularly the one on aluminum, which

went up almost twenty-five per cent., after all the members had warning to buy when the market was low.

Although there are other things that the association is doing quietly and industriously, those mentioned will give a fair idea of its work.

The chairman of the Committee of Management for two years was James Couzens, of the Ford Company. The present Committee of Management consists of Benjamin Briscoe, chairman; R. E. Olds, vice-chairman; H. O. Smith, treasurer; William Mitchell Lewis, secretary; Charles Lewis, W. H. VanDervoort, Charles E. Duryea, W. C. Marmon, Barney Everitt, and Alfred Reeves, general manager.

#### BOSTON SHOW DATES NOT DISTURBED.

BOSTON, Oct. 14.—Manager Chester I. Campbell, of the Boston Automobile Show, will this week issue the applications for space at the show to be held in Mechanics Building next March. Owing to the advancement of the date of the New York shows there has been considerable discussion here of the advisability of putting the Boston show ahead a month or more. The officers of the Boston Automobile Dealers' Association, however, have refused to change the date because they believe that for a retail business, such as is conducted at the Boston show, March is a better time than either January or February, and that coming just before the riding season the show in March creates more enthusiasm than it would at an earlier date.

In the show next spring nothing but automobiles and their accessories will be included, the management having been obliged to secure more room by excluding the motor boats.

#### PROGRAM OF EVENTS DURING PALACE SHOW.

Thursday, Oct. 24, P.M.: Private view of exhibition.  
 Friday, Oct. 25, P.M.: Merchants' night.  
 Saturday, Oct. 26, P.M.: New York City officials' night.  
 Saturday, Oct. 26, P.M.: Smoker, clubhouse of Automobile Club of America.  
 Sunday, Oct. 27, All Day: Open house at Automobile Club of America.  
 Monday, Oct. 28, P.M.: Engineers' night.  
 Tuesday, Oct. 29, 1 P.M.: Second annual show luncheon of the American Motor Car Manufacturers' Association at Hotel Manhattan.  
 Tuesday, Oct. 29: Society night. Admission \$1 instead of 50 cents.  
 Wednesday, Oct. 30: Meeting A. M. C. M. A. Committee of Management.  
 Wednesday, Oct. 30: Meeting A. C. A. Board of Governors.  
 Wednesday, Oct. 30: Military night.

#### A. A. A. Meetings During the Shows.

Wednesday, Oct. 30, 10 A.M.: Conference of representatives of A. A. A., N. A. A. M., A. L. A. M., A. M. C. M. A., and I. A. S., for the purpose of considering the advisability of automobile racing upon one-mile or less circular tracks. No. 437 Fifth avenue.  
 Wednesday, October 30, 4 P.M.: Conference of representatives of A. A. A., N. A. A. M., A. L. A. M., and A. M. C. M. A., discussion of plans for the general good of automobiling. No. 437 Fifth avenue.  
 Thursday, Oct. 31, 10:30 A.M.: Meeting of Executive Committee A. A. A. Board of Directors.  
 Thursday, Oct. 31, P.M.: Meeting of A. A. A. Finance Committee, subject to call of Chairman George E. Farrington. No. 437 Fifth avenue.  
 Thursday, Oct. 31, 3 P.M.: Open A. A. A. meeting for members, Convention Hall, Grand Central Palace.  
 Wednesday, Nov. 6, 2 P.M.: Meeting of A. A. A. stockholders at 525 Main street, East Orange, N. J.  
 Thursday, Nov. 7, 10 A.M.: Meeting of Board of Directors, A. A. A., 437 Fifth avenue.  
 Thursday, Nov. 7, 3 P.M.: Open meeting for A. A. A. members, 437 Fifth avenue.

#### CHICAGO'S COMMERCIAL VEHICLE SHOW.

CHICAGO, Oct. 14.—When the First Annual Commercial Vehicle Exhibit, in conjunction with the Seventh Annual Show at Chicago, was announced, it was the opinion of the management and of the directors of the National Association of Automobile Manufacturers, Inc., that if twenty exhibitors could be obtained a good start would have been made and that the times when commercial cars had attained such importance as to warrant a separate exhibition would have been suitably marked. The show is still nearly two months off, but with the closing of last week there were twenty-four exhibitors on the list and at least eight others in correspondence with the management. It is reasonably certain that there will be at least thirty exhibits of cars, fire apparatus and farm implements.

It is intended that the admission shall be largely by invitation. Each exhibitor will be supplied 1,000 invitation cards, to be mailed to interested persons. The exhibitors of cars, up to Saturday last, were the Studebaker, Franklin, Buckeye, Rapid, White, General Vehicle, Commercial Motor Truck, Logan, Reliance, Lear, Pope, Mitchell, Knox, Meiselbach, Pittsburgh Motor Vehicle, Johnson Service, Advance Mfg. and Couple-Gear companies, Gifford Pettit Mfg. Co., and Sayers & Scoville.

#### DETROIT'S FEBRUARY AUTOMOBILE SHOW.

DETROIT, MICH., Oct. 14.—The Tri-State Automobile & Sporting Goods Association have obtained a sanction from the Motor & Accessory Manufacturers, Inc., and will hold their seventh annual show in the Detroit Light Guard Armory the week of February 10 to 15, inclusive, 1908. Automobiles, commercial cars, accessories and motor cycles will be shown, and every effort is to be put forth to make the show one of the most representative of dealers' exhibitions in the country as befits Detroit's standing.

# SOME MICRO-STRUCTURAL CONSIDERATIONS\*

BY JOHN MAGEE ELLSWORTH AND THOMAS J. FAY, E.E., NEW YORK.

TIME was when metal was judged almost exclusively by the appearance of the fracture, but the fracture was viewed "a la nature" by the naked eye, and it is not to be wondered at if, on occasions, judgment failed. As the art advanced, and the needs of the occasion became more exacting, other methods were devised and introduced, all with the idea of realizing a greater degree of accuracy and in so far as possible to eliminate errors. But in the course of time it became more and more apparent that the first idea was right, in principle at any rate, and in these days to go back to the appearance of the fracture is the natural sequence.

Instead, however, of viewing the fracture in the old crude way, it is now the practice to make micro-photographs of polished and etched sections, and by magnifying the section even as high as two thousand diameters, bring out the structure so boldly as to enable one to view its details and to decide as to the condition obtaining with a marked degree of accuracy. True, micro-photographs are not new, nor are they of recent introduction, but they were mostly the product of advanced laboratories and were rarely ever referred to in commercial zones of activity. It will be understood, then, that the authors of this paper make no claims tending to advocate a new principle, but desire only to point out that what was once an academic matter is now verging into common practice, amounting to no more than a refinement of the foundryman's practice of old, in which he graded pig in accord with its fracture, and it is remarkable indeed how well the task was performed.

### Mal-conditions Readily Revealed by Micro-photograph.

Just why micro-photographs will disclose defects not likely to be exposed to view by any other process is quite easy to set down, if only the matter is afforded a little consideration. For illustration, an inferior product, manipulated by an expert, will develop physical properties of the conventional sort, quite up to average expectations for the given grade of material. On the other hand, this inferior product, with its best foot forward, is still the same inferior product, and in shock service or vibratory testing machines would expose the other foot. A micro-photograph would disclose the mal-condition directly and enable one to know without any further trouble just what might stand in the way of the success of a venture using such a product.

Take for illustration a piece of steel, disclosing "oxides" in the micro-structure, say at 350 magnifications, such a product can never be made safe for any exacting service, even though the steel might be so manipulated as to render it fit, from the point of view of a set of specifications; moreover, a chemical analysis might be quite up to the expectations in every way. It would seem, then, as if the micro-photograph, as a modern sequence of the old "fracture method," is as essential to success under present exacting conditions as the fracture viewing process of grading pig was in the days of old, and in view of the wide use to which "alloy steel" is now being put the micro-photograph takes on an especial significance at the present time, because micro-photographs of alloy steel are not easily obtainable and but little understood, even by advanced students who have been offered an opportunity to go into the matter the greatest possible length.

As regards micro-photographs of carbon steel and gray cast-iron, enough of them have been published to make it unnecessary to go further into this phase of the question at the present time, and the authors will confine themselves to alloy steel products involving chrome nickel steel and vanadium steel for the most part. In each case the micro-photograph will include chemical analysis and physical tests of the steel exposed to

view, and in this way it is hoped to fix upon a standard of comparison, such as may serve a very useful purpose in the long run, in view of the fact that these micro-photographs are of steel of the finest qualities for automobile work.

In this paper the micro-photographs offered are as follows:\*

Fig.	Subject.	Magnifications.
14.	Bischoff, chrome nickel steel.....	350
15.	Bischoff, chrome nickel steel.....	580

In these illustrations are represented practically all the conditions of the micro-structure of alloy steel, such as can be recommended in automobile work. Some of the specimens show the finest micro-structure possible to obtain, whilst one, Fig. 14, shows the structure of a supposedly abused product. For each specimen the test record gives all obtainable information, so that a further discussion in the text will be of no avail.

In proceeding, then, this paper will set down a résumé of the question of the constituents of steel as developed in the micro-structure and otherwise, whereas ordinarily carbon in steel is referred to as graphitic or combined, as the case may be.

To begin with, it is the carbon that is most likely to influence the structure, although the metalloids and the alloys are largely responsible for the selective carbon condition. As regards graphite, it will suffice to point out that its presence as an excess can only be assured in a product so high in total carbon that all may not combine. Graphite, then, may be regarded as

a regular component in gray cast iron or in white iron, because these products are all so high in total carbon that excess graphite is assured. In general it may be possible to consider that up to 2 per cent. total carbon, steel is the normal product, and graphite is not as a rule likely to abound. Above a total of 2 per cent. carbon graphite will be an excess, and in the product holding graphite the proportion of combined carbon can be very low, say 0.05 per cent., or very high, depending upon the proportioning of the metalloids and the conditions of manufacture. The total carbon rarely exceeds 4.50 per cent. at all events, and the exact carbon content is also dependent upon the ratio of metalloids and the process.

Considering steel free of graphite, it is fair to say the combined carbon in the products of commerce rarely exceeds 1.50 per cent., and in this product *in its normal state* the carbon condition is that, holding substantially fixed proportions of ferrite, cementite and pearlite, depending upon the total carbon, all combined.

It has been fairly well decided that with a total carbon of 0.90 per cent. normal steel consists of 100 per cent. pearlite, and for any "hypo-eutectic" condition in which the total carbon is less than 0.90 per cent. the whole carbon will be divided into pearlite in proportional relations and *excess ferrite, to make up the difference*; i.e.

$$\therefore .90 : a :: 100 : b$$

in which:

- a = the points of carbon present,
- b = percentage of pearlite.

Hence for illustration it would be possible to say for a 0.45 per cent. carbon

$$\therefore .90 : 45 :: 100 : 50$$

hence the pearlite ratio would be 50 per cent. and

$$100 - 50 = 50 \text{ per cent.}$$

ferrite difference, because ferrite is the excess in hypo-eutectic steel *under normal conditions*.

If, however, the total carbon is all combined and exceeds 0.90 per cent., the excess over and above the pearlite ratio *will be cementite*, instead of ferrite; hence, knowing the total combined carbon, one may at once know how much should be excess ferrite or cementite, *if the steel is in the normal state*, since all the excess will be the one or the other, depending merely upon the question of whether or not the product is a hypo- or a hyper-eutectoid.

**Normal and Abnormal Steels Specifically Considered.**

Of course, a product to be *normally constituted* must be allowed to freeze from its molten condition to its solid, cold state, within what might well be called *normal time*, and unhampered by any adverse environment. It is not the purpose here to fix a time or settle upon the environment, but in general slowly cooled carbon steel satisfies the condition and results in the normal selective eutectoid agreeable to the total of the carbon, whatever it may be in point of magnitude.

Abnormal steel, then, is the sole product of any set of conditions that may bring about a variation from the normal selective process in freezing or in cooling from any point high enough in the scale of temperature to disturb the steel out of its normal state of repose, or to upset the condition of the carbon.

It is not necessary to raise steel to the melting point to bring about a change in the carbon condition, and heat treatment consists in elevating and lowering the temperature to and from various points and at various rates, for no other purpose than to upset the normal state of repose and fix other states, with a view to take advantage of the resultant properties. The danger lies in not being able to establish conditions affording advantageous results, for of all conditions possible to fix by heat treatment only a few of them are of known advantage.

The main question, then, is that involving the alloying elements, as chromium, nickel, tungsten and vanadium, etc.

The rôle they play is in fact the matter of most concern, and probably the question least likely to be explained sufficiently. In

the main this matter can be treated in a way not differing in principle from the view taken of the simple compounds, since in the freezing process a eutectic is involved.

The freezing point of carbon steel depends, amongst other things, upon the carbon present and is influenced by the metalloids, but for a given percentage of carbon in steel the freezing point will again change if alloying elements are added, and if a compound product holding two or more alloying elements is considered, then the resultant freezing point will be something besides.

What would seem most to be desired would be a set of conditions, brought about by alloying, if necessary, that would tend to a uniform level of freezing for all the elements simultaneously from and at the same temperature. Then the resultant product would be uniform and would hold this uniformity for all time unless released by some process consistent with its natural characteristics. Vanadium, for illustration, seems to serve as a binder for the mass during the freezing process, and the result is a uniformity not so easily obtained in the absence of vanadium. Likewise, chromium, nickel, tungsten and other elements have their influences upon the temperatures of freezing and the selective process is influenced for good or evil, depending upon proportions and the process. Because these alloying elements do influence the selective process and the temperature of freezing, is not in itself a reason why the result may be good, and whilst vanadium, for illustration, is accredited with properties tending to abort segregation, even so, it is quite possible that the steel, although uniform, may not be *of even passing merit*. On the other hand, a perfectly uniform product has the intrinsic merit of being uniformly good or uniformly bad throughout, and that in itself is much to be desired, for then, upon devising a mixture and a process evolving good results they may be regarded as stable and can be duplicated at will.

Unfortunately, uniformly inferior products are prevalent, and no rule seems to be at hand by following which they may be avoided, hence the problem is one demanding the utmost care and attention, coupled with the closest possible observation.

One would naturally infer that the steel mill is the place in which to settle all such matters, but the failure of the steel mill to do so is reason enough for proceeding independently. Steel mills are places engaged for the most part in whipping raw material into shape on the basis of using the cheapest and most abundant raw material, into the shape that will command the highest price. Mills wax sarcastic when they are called upon to deliver what they term "jewelry steel," and it is now a fairly established fact that jewelry steel from common grades of blast-furnace pig is *cheap jewelry at best*.

**Desirable Properties that Alloy Steels Should Possess.**

Alloy steel possesses merit in proportion as the alloying elements are dissolved in iron free from all else besides. Of course, it is not possible to alloy pure iron with chromium, nickel, vanadium or tungsten, as the case may be, because some carbon must be present, and the metalloids are not to be entirely eliminated.

The best products thus far obtainable have compositions, viz.:

- (a) almost devoid of phosphorus.
- (b) almost devoid of sulphur.
- (c) very low in silicon.
- (d) closely limiting manganese.
- (e) holding an appreciable percentage of copper.
- (f) with the merest trace of arsenic.

Experience so far gained has established limits within which the alloys must be confined, and the relations of the alloys, each to the other, is equally a matter that cannot be ignored.

That the micro-structure is the most beneficial to view when it is desired to know just what transpires if variations are made in the relations of the alloying elements is now quite plain, and changes in the metalloids or in the carbon content are readily noted, even at fairly low magnification.

Besides variations of components there are variations in condition as well, as, for illustration, the pearlite may be granular or lamellar, depending upon circumstances, or the structure may be abnormal.

It has been said the normal structure is that produced by the selective freezing process, conditioned upon the composition of the product, allowed to solidify and to further cool down to the atmospheric temperature, slow enough not to interfere with the selective freezing process.

The abnormal product, then, would be that resultant of a heat manipulation, since in any case the composition—generally speaking—would be the same for the normal as for the abnormal steel, but the carbon condition would not be the same, so that whilst the total carbon, as found by a "combustion test," might be the same in both the normal and the abnormal steel, the carbon would not be the same as viewed by the microscope, or as would be depicted in a micro-photograph.

**Critical Points in Cooling Steel.**

It is now generally well understood that steel, if heated to a sufficiently high point, say 850° C., will, if allowed to cool slowly, exhibit phenomena observed by Osmond as follows:

In the cooling process, if allowed to proceed uninfluenced, points in the range will be observed, at which the cooling process arrests, a pause takes place, as it were. These "critical points" are designated as Ar<sub>1</sub>, Ar<sub>2</sub> and Ar<sub>3</sub>, of which there are three points during the cooling of iron and steel if it is quite low in carbon.

On the other hand, during the heating process there are "converse critical points" and they are designated as Ac<sub>1</sub>, Ac<sub>2</sub>, Ac<sub>3</sub> points. If, however, the carbon content is quite high, the critical points Ar<sub>1</sub> and Ar<sub>2</sub> verge, whilst the converse points verge also.

These critical points do not always become apparent at pre-

cisely the same temperature, for, as Mr. Osmond stated, they are influenced by the ratio of heating or of cooling, as the case may be. At all events, it is the carbon present that the authorities ascribe these phenomena to, and by observation and through the utility of micro-photographs they have been enabled to fix the probable carbon condition, in view of the temperatures to which a given product may be subjected. Moreover, the allotropic condition of the iron would take on states depending upon the nearness of critical points, and right here it may be well to say the working of nature hard steel will be much facilitated by taking into account the critical points and ranges, together with the time allowed for both heating and cooling, in all attempts at heat treatment.

Harboard sets down the Ar ranges as follows:

CRITICAL RANGES.			
	Commences.	Maximum between.	Conclusion.
Ar <sub>1</sub> .....	845°	825° to 810°	800°
Ar <sub>2</sub> .....	755°	736° to 725°	710°
Ar <sub>3</sub> .....	680°	662° to 655°	645°

Temperatures given in Centigrade.

These ranges and temperatures hold for iron and mild steel. It is further pointed out that changing the carbon changes the temperature, hence carbon is the source of the phenomena. Moreover, the rate of cooling is something to be taken into account.

In the heating up process the critical points do not hold at the same point on the thermometer scale, because of a lag or a lead depending as the temperature moves up or down. The difference is fixed at something like 30° C.; that is to say, the heat retarding influence takes place on the scale some 30° C. above the point observed for the heat addition on cooling down.

Vanadium seems to be entitled to the center of the stage just at the present, although it may not be out of place to say that vanadium has been in quite extensive use for several years. Most of us used vanadium unconsciously in some of the superior alloy steel products, but took no notice of the fact because the amount of vanadium present was in many cases so low as not to attract attention; moreover, the analysis for vanadium is attended by much difficulty. It now seems to be quite certain that a "poison dose" of vanadium is that, even as low as 0.20 per cent., and the authors have actually succeeded in establishing the fact that 0.25 per cent. vanadium in an alloy steel product is a considerable excess, and it has been shown that the same steel without vanadium up to 0.25 per cent. would render superior service. It is no wonder, then, that small increments of vanadium as 0.08 per cent. would go unnoticed for a long period of time, and yet so little of this element in some grades of steel would suffice for "scavenging" purposes. The American Vanadium Company, in their advanced work, are persistently recommending a limit of 0.18 per cent. vanadium, and whilst the amount desired, according to them, is a variable, the maximum is fixed at this low point.

There is now some chance for controversy leading up to the question whether or not nickel should be a content if vanadium is present. Chrome vanadium steel holds excellent properties and should find a wide range of uses, but the tests accompanying this article will show some remarkable results using nickel, and it is proper to point out that such steel as the Bischoff Special Auto Steel holds nickel as well as chromium and vanadium.

It is regrettable that the American Vanadium Company did not include in their comparative tests as given with this article tests of such products as the Bischoff Special Auto Steel; moreover, some of the Krupp products are chrome nickel vanadium steel, and their properties are quite too good to be ignored.

So far the authors have been unable to get away from the fact that any considerable amount of vanadium in alloy steel poisons the product and they are of the opinion that for steel of the greatest strength a very small dose of vanadium, retaining nickel and chromium, of course, holds out the most promise.

## WILES OF THE UNTAMED CHAUFFEUR

By CHARLES B. HAYWARD.

WE were riding uptown in a car together, a chauffeur whose acquaintance I had made and myself, and the subject of "being pinched" came up for discussion. "Now, there's one of them, over there with his bike," and the man at the wheel beside whom I was sitting, inclined his head to indicate the position of one of New York City's traffic policemen, whose chief duty nowadays seems to be that of apprehending those whose desire to "let her out" gets the better of them at times.

"He's a fresh guy," continued my seat mate at the wheel. "Just watch me fool him," he added, happening to catch the eye of the guardian of the law who was regarding us suspiciously from a distance. Suiting the action to the word, the moment their glances met the chauffeur shifted back to second with a bang and pressed the accelerator pedal down. We had previously been running along smoothly on the high at about ten miles an hour, as shown by the speedometer, and the change resulted in bringing the speed to about twelve, but the car—an old one of the side-chain type—sounded as if it were going thirty.

"Here he comes," piped up my friend, announcing the success of the ruse, then carefully keeping his eyes straight ahead. Sure enough, the policeman had ceased to pose and was coming after us on his bicycle. As our speed had only increased a mile or two, he naturally had no trouble in overtaking us, but verifying the reading of his own speedometer by ours which was in plain sight from his seat, he indulged in some choice compliments, during the delivery of which my friend discreetly maintained silence, and then sheered off to watch for other game.

"That gets 'em, every time," gleefully chirped up the deceiver, once the threatened "ride to the house" was no longer an impending risk. "They think every time they see you handle the lever and the car makes a little more noise, you're hittin' it up at a good thirty or more, and this is the old bus to fool 'em all right." Something to which I tacitly gave assent, for on the second with the motor speeded up she made a hullabaloo like a saw-mill cutting through hard knots in a pine log.

Things lapsed into silence for several blocks, during which time we passed other minions of the law without attracting unfavorable attention, and the sight of which did not appear to induce a desire to give further demonstrations of the efficacy of the deception. Then my friend suddenly exclaimed, "There goes a 'skunk'!"

With solid rows of houses on either side of the street and nothing more suggestive of the country than a sun-dried strip of grass under which the subway trains rumbled at intervals, I looked around in a puzzled way to detect the unsavory quadruped that had called forth the remark. Finally, unable to contain my curiosity any longer, I innocently inquired, "Where is it?" which only brought forth an amused look of amazement.

"Huh, you're not on, eh? Well, there comes another," and he indicated the negro driver of a big, spic-and-span car approaching from the opposite direction. "We have no use on earth for them fellers," he went on, from which I learned for the first time that the race problem had been injected into the business of driving and taking care of an automobile.

"They're no use, and every one of us makes life a burden for every coon 'shover' that comes our way," he went on, detailing in his own way the deep-rooted dislike that every white driver had for his brothers of a darker shade who had the effrontery to so demean a high profession as to enter its ranks. Then, lapsing back into his usual good humor, he added: "Those fellers certainly do have a hard row to hoe. They simply can't get a square deal in any of the garages in this town," he went on laughingly as he recalled an incident that tickled him.

"Only last week one of 'em got a job taking care of a big imported car that was stalled in our place regular. It was bran' new—just run around from the carriage maker's, not a speck on it anywhere—but that coon went round with a magnifying glass

and a chamois givin' things an extra polish off before he quit that night. We fixed him allright allright. He wasn't much more than out of sight before we had the spark plugs out of the machine and filled the cylinders with about a gallon of thick shellac. Trouble? Well, I guess. That car was in the shop two or three weeks and I wouldn't have taken the job of cleanin' up that mess for a hundred plunks.

"Oh, no, nobody did it. The woman what owned the rig made a holler, but the garage keeper don't have the hirin' of us, so no one lost his job. You see," he added, in a tone meant to put an effective quietus on the subject, "the garage keepers ain't got any more use for skunks than we have."

Not to pursue an unpleasant subject any further, I inquired how much truth there was in the reputation that most chauffeurs had acquired for grafting on the gasoline supply, not to mention a host of other things. But any fears that I might have had as to professional reserve on such a delicate subject of inquiry, proved entirely unfounded.

"Sure thing, some of the fellers pinches the gas right under the old man's nose. Of course, I ain't givin' no names, but a friend o' mine who drives a big 60 —, turned the trick neat. His boss put up a holler about the car usin' so much gas when he hadn't been making any long runs, and he wanted to be shown. So my friend rigs up a deal to show him. Says the old man one day, comin' into the garage, 'put ten gallons of gas into her and we'll see how long it lasts.' The boss goes back into the office for a little while and my friend gets to work and fixes up the plant. He takes a five-gallon can, takes out the drain plug of the carbureter and puts the can under it. The gas sure comes out in a good stream, but a funnel and a chamois for it to drop on, and it doesn't make a bit o' noise. Then he gets things ready at the tank and invites the boss out to see the ten gallons put in. By delayin' things good and plenty, by the time he has the ten in the tank, five is out again in the empty can, and it's no trouble to get the plug back without any one gettin' wise, for all he has to do is to turn the stopcock in the line to cut off the flow, and then people expect you to be always doin' some fussin' or other about the car anyway. He fooled him allright.

"Ah, cut it out! we fellers don't get the rake-off on tires and things that people talk about. That's all a pipe," he returned in a disgusted tone to my lead about other kinds of graft. "When a feller wants to show the old man that the car is chewin' up twice as much gas as she ought to, he don't do it for the coin. He might be runnin' the car himself. A run down to the beach and back means 50 or 60 miles easy, and then when the governor's away over Sunday, a feller might take his friends a couple o' centuries or more, without any one bein' the wiser except for the half-barrel o' gas or so that he uses up."

"These big ones do use a powerful lot o' gas," he replied to my audibly expressed doubt that a car could consume as much fuel in a day's run as he had indicated. Then, you see, we don't spare it none, so we hardly ever do more than twelve or thirteen to the gallon, and most of us not that much by a good deal. Besides, we always hit the tank for a pint or so every time we do any wiping and to wash up on after gettin' through.

"Oh, yes, same way with oil and grease," he laconically assented in reply to a suggestion in that direction.

"Who pays for the tires you happen to damage on these 'joy rides' with your friends?" I inquired, cautiously.

"Oh, the governor has to dig down for everything. We don't stand for anything of that kind. What's the use?"

Unfortunately, I had to cut the interview short at this point by leaving the car, but promised to accede to the pressing invitation of my friend to take another ride with him in the near future, and, by the way, learn something more of the under side of taking care of a car, though this was not expressly included.

# CHARACTERISTICS OF THE AMERICAN RUNABOUT

By WALTER IRVING.

WHATEVER may be said with reference to present-day standardization of automobile engineering practice, a study of the characteristics of American runabouts will reveal an astonishing variety of ideas as to the relations that should exist between the weight of the car, the power of the engine, and the price for which the car should be sold. Some conception of the great diversity of opinion that must necessarily exist among automobile engineers and manufacturers may be gathered from a study of the accompanying table, which gives the weight, horsepower, and selling price of a number of well known runabouts, equipped with engines having from one to four cylinders. Naturally such a tabular analysis cannot take into account the differences in design, workmanship, and quality of materials, as well as of finish, all of which must be considered by the prospective purchaser in deciding what type of car most nearly meets his requirements as to external or internal finish, durability, power, and economical performances.

However, the table may serve a useful purpose in directing attention to facts that would otherwise be less well understood. For example, the table shows that, according to catalogue ratings, the majority of runabouts having single cylinder four-cycle engines weigh from 1,000 to 1,200 pounds, the average weight being 1,011 pounds, as shown in the summary. Most of the buggyabouts, or high-wheel runabouts, a typical western product of growing popularity, weigh from 500 to 900 pounds, while runabouts having the double opposed type of four-cycle engine

weigh from 1,000 to 1,800 pounds. Considering only maximum and minimum weights to obtain an average for each class of runabouts, the results are approximately as follows: Buggyabouts, 750 lbs.; single-cylinder cars, 1,050 lbs.; double-cylinder opposed, 1,500 lbs.

Price popularity is indicated by the table about as follows: Buggyabouts, \$600; single-cylinder cars, \$650 and \$800; double opposed, \$800 and \$900; low power four-cylinder cars, \$600 and \$750. When the prices for each type of runabout are averaged, however, the figures obtained are about as follows: Buggyabouts, \$530; single-cylinder runabouts, \$680; double opposed, \$1,025; low power four-cylinder, \$600 and \$750.

Power ratings for runabouts of approximately the same weight vary within surprisingly wide limits. Curious as it may seem to many, the western buggyabout, or high-wheel type of runabout, is provided with an engine rated as being from 20 to 25 per cent. more powerful than those of the older style of runabout—having single-cylinder vertical and horizontal engines of the four-cycle type. Doubtless, this is due somewhat to the development of the two-cycle type of engine, with which several of the runabouts are equipped. Two-cycle engines having single and twin cylinders and also double opposed cylinders are employed; in fact, there seems to be a growing tendency to find a wider application for this type of engine in all classes of motor vehicles, regardless of their size or weight.

Most of the runabouts equipped with double opposed four-

cycle engines are rated at from 12 to 14 horsepower, but there are quite a number of cars having engines rated as high as 24 horsepower. The low or medium-powered runabouts having four-cylinder, four-cycle engines are popularly rated as having 16, 18, 20, and 24 horsepower. On referring to the summary, it will be noticed that the average power ratings are as follows: Buggyabouts, 10.7; runabouts with single vertical and horizontal engines, 8.81; double opposed, 16.27; low power, four-cylinder, 15.

Other things being equal, the car having the most power for the least weight is generally considered to be the most desirable, for the cost of maintenance of tires for a given mileage over ordinarily good roads is much less with light than with heavy cars. Examination of the table shows that, as one would naturally expect, the single-cylinder runabout weighs more per horsepower than any of the others. The lowest tabulated weights per horsepower are as follows: Single-cylinder cars, 83.3 lbs.; buggy-

abouts, 54.1 lbs., showing rather a great disparity in this respect.

Considering the question of price per horsepower, the table shows that the Ford, Model N, costs less than any other car. The price per pound of weight is correspondingly low, but it is not as low as that of the Postal, a 12-horsepower buggyabout weighing 900 pounds and selling at 52.3 cents per pound of weight. Reference to the table will show that the average prices per horsepower are approximately as follows: Buggyabouts, \$50; two-cylinder runabouts, \$65, and single-cylinder cars, \$80, there not being as much difference here as in the weights.

A tabular analysis such as is here presented may not answer the query, "Which do you want, ability or pounds?" but eliminating questions involving design, strength of materials, endurance, fuel economy, and general equipment, it does give some idea of the comparative merits of different types of runabouts from a mechanical standpoint.

## TO OBTAIN FACTS: COMPARE INITIAL COST AND MAINTENANCE

CLEVELAND, O., Oct. 14.—Prof. L. J. Buschman, instructor on gas engines and automobile engineering at Case School of Applied Science, recently presented a paper on the "Efficiency of the Motor Vehicle." Prof. Buschman was one of the technical committee in charge of the recent endurance contest given by the Cleveland Automobile Club, and he has made a study of the efficiency of gas engines and gasoline automobiles. In part Prof. Buschman said:

"Of course many owners do not care how much the operating expenses amount to, but the majority of prospective purchasers are men who would buy if they thought that they could keep up the running expenses. Little data can be obtained from the manufacturer, as he has not taken the time to collect such information, because he can sell his cars as fast as he turns them out, although one company has been publishing some data in the advertising columns of the trade papers.

"Economy cuts more figure with the commercial than with the pleasure vehicle. The prospective purchaser knows what his horses cost and what they can do. Glittering generalities do not go and the salesman must come down to facts and figures.

"How, then, are we to judge of the merits of the different cars? Why not the same as when buying any other piece of machinery by comparing the initial cost and the operating expenses? To show how necessary it is to be careful in the various adjustments the following experiments are noted:

"In some experiments on fuel economy it was found that with the engine giving the same power, the consumption of gasoline would vary as much as twice that really required. The writer in experimenting with spark coils found that with apparently the same size of spark that one coil could be made to run on the battery with from one-half to two amperes by giving the vibrator screw a half turn, and with other coils four and five amperes with one turn or more.

"One way of getting satisfactory information is by a sealed bonnet contest where an account is kept of the gasoline, oil, and water consumption. It has been urged that the Glidden tour be made a contest of this kind. To this end every car should carry an observer appointed by another contestant. The cars should not only be penalized for breaking of seals and making repairs, but also for excessive gasoline, oil, water, tire, and battery consumption. The schedule for the day should not call for more than 15 miles an hour. In case two or more cars had perfect scores, the lowest powered car should be declared the winner.

"Various contests have been run to show the efficiency and economy of the motor car. A contest was recently run off in London where the car ran up an incline and stopped while the engine ran for ten minutes. This was then repeated with the car backing up the incline. Samples of the exhaust gases were then taken and an analysis determined the winner."

## SOME FIGURES ON AMERICA'S RECORD OUTPUT

A striking example of the growth of the American automobile industry is furnished by figures on the output of the most important firms of the American Motor Car Manufacturers' Association exhibiting at the Grand Central Palace show. It is estimated that the output during 1908 of the fifty-one firms included in the A. M. C. M. A. will be 37,000 automobiles, selling at an average price of \$2,533. The estimated total output in the United States for next year is 55,000 cars.

Eight firms occupying the center spaces at the Palace show will produce during the coming season at least 27,000 cars, most of them of the low power, popular type. During the past twelve months the Ford Company sold 10,000 runabouts and will produce 15,000 next year. The Maxwell people will make 5,000 cars at their factories in Tarrytown, N. Y., Pawtucket, R. I., Chicago, and New Castle, Ind.; R. E. Olds announces that the Reo Motor Car Company's output will be 4,000 cars; the Mitchell Motor Car Company will make 3,000; Stoddard-Dayton about 2,100; the Premier company, 600; Wayne, 600; and National, 400. Even

conservatively listing the Ford output at 12,000, this gives a total of 27,700 automobiles of a popular type. It is worthy of note that a large number of these firms having contributed to place the American automobile industry in the lead numerically are of quite recent origin.

Complete figures on the output of every American constructor are not yet available, but the estimate of 55,000 cars is considered to be a fairly accurate and conservative one, and the 27,700 of the eight makers of popular cars is alone sufficient to show the huge proportions which the industry has assumed in a few years. It also bears striking testimony to the fact that the American maker has been forehanded in this respect. He has realized that the ultimate demand will be for the popular-priced car, which must be turned out in vast quantities if the demand is to be successfully met, and the surprisingly good materials and workmanship he has been able to put in them is the wonder of foreign makers. In this field the American manufacturer has far outstripped the foreigners, already sending large numbers abroad.

## LETTERS INTERESTING AND INSTRUCTIVE

### REGARDING SELDEN PATENT AND ROYALTIES.

Editor THE AUTOMOBILE:

[942].—I have been a constant reader of your "Letters Interesting and Instructive," and would like to ask a few questions.

1. What particular part or principle in automobile construction is covered by the "Selden" patents?

2. Are all builders of automobiles in this country paying a royalty to the "Selden interests?" If so, how much?

3. Would there be any serious objection to tightening down the adjusting screws on a four-unit vibrating coil, making it a non-vibrating coil, the putting an ordinary electric buzzer with platinum contacts in the primary circuit between the battery and the "ground" connection on the frame, thus using the buzzer as a master vibrator?

SUBSCRIBER.

Moline, Mich.

1. Broadly speaking, the Selden patent covers the combination of an internal combustion motor of the compression type to a road vehicle or horseless carriage with a means of disengaging the connection between the motor and the road wheels. On that account, it is considered basic, and if upheld as valid will apply to practically all gasoline automobiles as at present constructed.

2. Earlier in the career of the American automobile industry, the majority of the more prominent makers formed an association and each agreed to pay a royalty. This is the Association of Licensed Automobile Manufacturers, or, more familiarly, the Licensed Association, or Selden Interests. The royalty is 1-4 per cent. It has been the policy of the association to restrict its membership practically to the organizers, as its constitution is to the effect that only firms who were established automobile manufacturers at the time of its formation, are eligible to membership. In the meantime, the American industry has grown to such an extent that the members of the Licensed Association now only represent about 1-3 of the total, though the value of the cars turned out by them annually is much greater, proportionately to the total, than their numbers would indicate.

3. There would be no objection to this in principle—in fact, one firm is now marketing a master vibrator designed for exactly this purpose. But there would be considerable practical objection to the use of an ordinary electric buzzer. The latter is not an instrument of precision by any means, as will be apparent from the fact that probably two or three dozen buzzers could be had for the price of a single well-made vibrator. They are not designed for fine adjustment or hard work and would be constantly giving way.

### ADVISABILITY OF INSTALLING ROLLER BEARING.

Editor THE AUTOMOBILE:

[943].—I have a Jewell Stanhope which answers my requirements in all respects, except that it runs hard on account of the plain habbitt bearings being badly cut out by sand.

Which would be better, to have the plain bearings rehablitted, or to have roller bearings put in? If roller bearings would be the best, can you give me the names of some reliable makers of such bearings in the vicinity of San Francisco?

Berkeley, Cal.

D. D. DAVENPORT, D.D.S.

Roller bearings would certainly be preferable to the old plain type, provided the design of the parts in which they are to be installed permits of their use without too much change, and also, in case you wish to go to the extra expense involved in equipping your car with an anti-friction type of bearing. The most obvious remedy, however, would be to have the old bearings rebabbitted and provide them with an efficient sand-excluding housing which would prevent a repetition of the trouble you complain of. We do not know of any maker of such bearings in or near San Francisco, but you will find the announcements of various makers of anti-friction bearings in the advertising pages of THE AUTOMOBILE, and the majority of such manufacturers have agents or branch houses on the Coast.

### WHAT CAUSES WATER TO ISSUE FROM EXHAUST.

Editor THE AUTOMOBILE:

[944].—More especially since the cooler weather of autumn, I have noticed a profuse liquid discharge from the exhaust of my car. My motor is of the double-opposed type, and this discharge is more marked after the engine has been at rest over night, and it apparently ceases after the engine has been running a few minutes. I first thought the liquid was unburned gasoline, but closer inspection reveals neither the odor nor taste of gasoline. Muffler explosions have occurred but a couple of times during the past six weeks, with the engine in use about every day. The engine runs very well and develops the usual power, but sometimes starts a little slow. Close attention has been given to the ignition and the carbureter. While the latter is wasteful, in that it leaks from one to two minutes after the motor stops running, I do not think it can cause this spray at the exhaust. Is this liquid unburned gasoline, notwithstanding my decision to the contrary, or is it water, as I believe it to be? If water, is it contained in the gasoline I use, or can it in any way result from condensation of atmospheric moisture, owing to the cooler weather?

For pages of "Letters Interesting and Instructive."

Farmland, Ind.

L. N. DAVIS, M.D.

The moisture in the air is largely accountable for the liquid discharged at the exhaust for the first few minutes after starting. It is composed of the water of condensation and contains gasoline in almost the same proportion as the fuel mixture did, but this is so slight as to be hardly perceptible in the fluid in question, as it is an extremely dilute mixture. The warm air of the mixture will naturally condense as the cylinders cool on a frosty night and the same is true of the gasoline vapor. The carbureter needle valve doubtless needs adjustment, as it is evident that too much gasoline is being drawn through the nozzle, otherwise the carbureter would not leak when the motor was stopped. The presence of this water in the cylinder makes starting more difficult, and as a preliminary the cylinder drain cocks should always be opened so as to relieve the motor of it. Steam condenses in the same manner in a steam engine and it is frequently dangerous to attempt to start it without having allowed the water to escape. The quantity is naturally greater than is the case with a gasoline engine, but the same conditions obtain to a very great extent.

### A COMMON DIFFICULTY WITH COMPLICATIONS.

Editor THE AUTOMOBILE:

[945].—Will you kindly publish through "The Automobile" a remedy for the following? I have a two-cylinder, small touring car about 10 horsepower, which is equipped with a Schebler carbureter. In winter my carbureter becomes clogged with soft ice, and the motor then stops. The air intake is about 2 1-2 or 3 inches from the exhaust pipe. I am using 1-2 inch standard gas pipe from carbureter to intake valves, and carbureter is about 16 inches below intake valves. Would covering this pipe with tape or flannel be a benefit, or would putting on an extra long piece of pipe from carbureter to exhaust pipe, and thereby take very hot air, do any good? I have it piped so that the carbureter is low down at the forward end of the motor, as shown by the accompanying sketch. Will you kindly advise me regarding this?

New York City.

F. C. FRANKS.

From the arrangement of the piping on your car, coupled with the fact that the inlet manifold is but 1-2 inch iron piping, it is the greatest mystery to us that you have ever been able to make the motor run at all, or at least, satisfactorily. Piping hot air from round the exhaust pipe to the carbureter will doubtless overcome the fault you refer to, but the whole arrangement is fundamentally wrong and not calculated to give anything like as efficient service as the motor is doubtless capable of under favorable conditions. We should recommend discarding the present manifold entirely for a number of reasons. In the first place, it is far too small; it is too long; it has too many elbows and last but not least it is not of the proper material as iron pipe is not at all suited to the purpose. To add to all these, the

THE OASIS, WHICH INVITES REST AND REFRESHMENT.

town, painfully new and European, but it is the point from which an excursion may be made to the ruins of Timgad, 37 kilometers distant, by an excellent though remarkably sinuous road. We went there in the afternoon and agreed on our return that we had had perhaps the most interesting experience of our trip and one that we should have been very sorry to have missed.

#### An Unearthed Early-Century Roman City.

Timgad, the ancient Thamagudi, was situated at the intersection of six Roman roads and was one of the outposts of the Empire in Numidia. It was built by order of the Emperor Trajan as the headquarters of the Third Legion, and the soldiers of that legion were employed in its construction, which began in the year 100 A. D. and was completed about the year 170. It was a flourishing city for more than 500 years and then succumbed to the Arab invasion in the seventh century. Shattered by earthquakes and covered by a slow accumulation of sand from the plain and soil from the mountains, it lay buried for nearly 1,200 years. Its excavation was begun under government auspices in 1881, and with a small annual appropriation has been continued ever since. About two-thirds or three-quarters of the area of the ancient city has been disinterred, including the Forum, the Capitol, the Basilica or Court of Justice, the Theater, the principal temples, the Arch of Trajan, the Market Place, extensive baths or thermæ (these are very striking), fountains, shops, and private residences. Miles of the original street pavements, bearing the marks of the ancient chariot wheels, stand revealed; and altogether these ruins are the most interesting Roman remains that have yet been found, with the possible exception of Pompeii.

Timgad was a more important city than Pompeii, with a larger population and finer buildings; and as it was built by im-

STREET IN KAIROUAN—MOSQUE OF THE SWORD IN CENTER.

perial fiat, at the height of Rome's power and splendor, it may be taken as an adequate example of the Roman conception of what a city should be. No doubt some of the best Roman engineers and architects were sent to supervise its construction, and it is probable that before a stone was laid or a foundation dug the city had been planned as a whole, and the location of its principal streets, monuments, and buildings determined. At Paestum, at Girgenti, and at Segesta, also at Dougga and El Djem here in North Africa, may be seen single temples, theaters, or other structures in better preservation than any building at Timgad; but nowhere else can one obtain so vivid and so accurate an idea of what a Roman city was as a whole in the classic days of the Empire.

In the museum near the entrance to the ruins are some of the finest ancient mosaics yet found, and in the baths or thermæ some of the mosaic pavements have been left in their original position. If possible, a whole day should be given to Timgad, and such a visit will repay all the trouble and expense of a trip to North Africa.

On the way to Timgad, about ten kilometers from Batna, are the ruins of Lambese, the ancient Lamboesis. The most interesting of these can be seen from the road in passing, and the time required for a closer inspection can be spent more profitably and interestingly at Timgad.

The road from Batna to Constantine leaves nothing to be desired, though the country traversed is without interest, and very fast running is safe. We made the distance, 120 kilometers, in a little more than two and one-half hours and arrived at Constantine in time for midday lunch on Thursday. There are two first-class hotels at Constantine and a spacious garage where supplies and accessories of all kinds may be had, but the charge for garage (5 francs or one dollar a night) is excessive. The charge for gasoline is 50 centimes a liter (40 cents a gallon.)

#### Constantine, a Mighty City of Eighty Sieges.

The city of Constantine is, next to Algiers, the most important and populous in Algeria. It has about 50,000 inhabitants, of whom nearly 16,000 are French, 8,000 are Jews, and 25,000 are Arabs. Each of the latter races has a distinct quarter of the old city, which are especially interesting to visitors, and the European quarter is growing rapidly and contains some fine modern buildings. By reason of its location on a gigantic mass of rock rising precipitously and towering a thousand feet above the surrounding plain, from which it is cut off on three sides by the profound chasm of the river Rummel, it must have been from the very earliest times the site of a city and fortress. As a Phœnician colony it was known as Cirta. Captured by the Romans about 70 years B. C., it took the name of the Emperor Constantine in the fourth century of our era. Falling like the other cities of this region before the Arab invasion, it was taken by the Turks in 1535 and by the French in 1837. During its long history it successfully withstood eighty sieges, and before the invention of longrange artillery it was practically impregnable, for direct assault was impossible.

Besides the Arab and Jewish quarters, the places best worth visiting are the Palace of the Bey el Hadj-Ahmed, a fine specimen of Moorish architecture, the Mosque Djama-el-Kattani, the Palais de Justice, the Casbah or citadel, and the markets; and no one who wishes to get an adequate idea of the remarkable situation of Constantine should fail to traverse the Chemin des Touristes (Road of the Tourists) cut out of the opposite cliff of the Gorge of the Rummel and affording startling views looking either up or down.

#### A Run Through the Granary of North Africa.

Between Constantine and Hammam Meskoutine, a distance of 112 kilometers, the road is one of the most serpentine ever constructed. Otherwise it is good, the descent from Constantine to the level of the sea at Bone being very gradual. The aspect of the country and of the few towns en route is distinctly European.

Few Arabs or other natives were seen, and the European colonists are scattered in farm houses that lie at long distances from each other. This is one of the chief wheat growing sections of North Africa and vast wheat fields extended in every direction as far as the eye could reach. Farming operations are evidently carried on on a large scale, and the soil looks fertile and well tilled. During the Roman period Northern Africa was the granary of the Empire and was the source from which the bread came that was furnished free by the Cæsars to the turbulent populace of Rome. Under proper cultivation Algeria and Tunis could now supply France with all the wheat she needs to import, but native agriculture is primitive and the average yield of wheat in Algeria is only eight bushels to the acre. In the section between Constantine and Bone, however, the yield must be much greater, as the result of European methods.

To reach Hammam Meskoutine we had to make a divergence of five kilometers from the main road at a distance of 107 kilometers from Constantine, but no automobilist should fail to make it, for the road is good all the way, and Hammam Meskoutine is not only one of the most attractive and interesting

The waters are utilized for bathing purposes in two establishments, one for natives and the other for visitors. There is a comfortable and well managed hotel with several sun-terraces. And the mildness and uniformity of the temperature are shown by the luxuriant vegetation, of which orange and lemon trees are the most striking feature, though there are olives, myrtles, and palms in abundance, and multitudes of flowers in marvelous variety. After desert wastes the sight is delightful.

After enjoying an excellent lunch at the hotel and inspecting the attractions of the place, we returned to the main road and resumed our journey toward Bone, distant eighty-six kilometers. Soon the hilly character of the country changed and we traversed level prairies on a road almost as straight and direct as those of France and nearly as good.

Bone was reached at 6 P. M. It is a prosperous little seaport, very new and European looking, though its history goes back to the Phœnician period. It is built on a portion of the site of the Roman Hippo Regies, of which St. Augustine was bishop at the end of the fourth century and where he died while the city was being besieged by the Vandals. On a hill overlooking

RUINS OF TIMGAD, CITY OF THE THIRD ROMAN LEGION IN NUMIDIA, BUILT BY THE EMPEROR TRAJAN.

places in Algeria, but has a garage where repairs can be made and gasoline bought (60 centimes a liter, or about 48 cents a gallon), and where the usual supplies are stocked.

The hot springs here must have been known and used at a very remote period of antiquity, for vestiges of Punic structures have been found, while Roman ruins abound in the vicinity. But by far the most interesting constructions are those of the springs themselves. These springs are almost twenty in number and the water gushes out at a temperature of 205 degrees Fahrenheit, nearly the boiling point. As it cools, the carbonate of lime with which it is very strongly impregnated is deposited, hardens, and forms a wall around the source which continually grows higher and higher. When it gets so high that the forces below can no longer drive the water up over the rim of the cone, the water seeks a new opening, which becomes another spring and begins anew the process of upbuilding. In this way, in the long course of ages, a chalk cliff nearly eighty feet high has been built up, and over this the water from the principal springs trickles, forming what is known as the Cascade. This cascade is unique among natural wonders, for it looks exactly like a petrified waterfall played upon by sunlight and showing nearly all the colors and tints of the spectrum, and its beauty is indescribable. The sight should certainly not be missed.

the plain on which the Hippo stood has recently been erected an imposing basilica to commemorate him. The best hotel at Bone leaves much to be desired in the matter of cleanliness and its stuffy rooms were freezing cold on the night of our arrival (March 29). But there is an excellent and well equipped garage there at which supplies of all kinds may be had. The price of gasoline was 2 francs 70c. for the bidon of 5 liters (about 45 cents a gallon), and we found here some Michelin inner tires which could not be obtained at Constantine.

#### Tunisian Frontier Roads Might Be Improved.

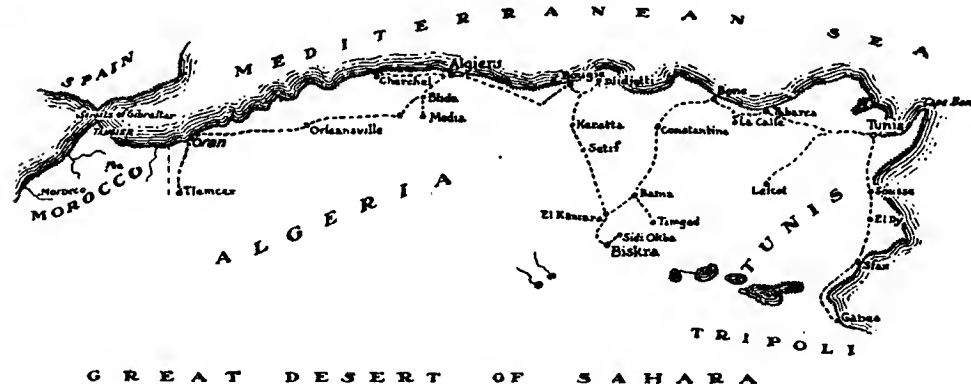

The road eastward from Bone to the frontier of Tunisia is one of the worst we encountered. As far as La Calle (86 kilometers) and for some distance beyond, it is encroached upon in places by a railroad track, and the roadbed itself was in very bad condition, especially between kilometer posts 45 and 55 (from Bone). Beyond La Calle there is a pretty stiff climb through cork forests, and then a succession of ascents and descents until the frontier is reached at Babouch, about 26 kilometers from La Calle. There are only two or three inconspicuous houses at Babouch, and we would have passed at full speed but for a gesticulating Arab who shouted "Douane" (custom house). If our car had been of foreign make we should have had to pay

duty. As it was a French car it was only necessary to show our *passavant*, or permit, to travel in France and her colonies.

Until last year the usual route from the frontier to Tunis was via Tabarka and Béja. This is the more direct, but at Bone we were told by the very intelligent and well-informed manager of

for El Kef is situated on a lofty plateau which looks down steeply on the plain and offers nothing of interest to the visitor. We were also told at Souk-el-Arba that no gasoline could be obtained there, but we did not make inquiries ourselves.

Turning sharply to the left again after the cut-off had been traversed, we found ourselves on the "grande national route" that runs southwest from Tunis to El Kef. The distance from Tunis was 161 kilometers, and the road all the way, except where repairs were in progress, was superb, though passing through a country that possesses no interest from the scenic point of view. At Teboursonk, on a hillside two kilometers off the main road, we stopped early for lunch, intending to visit afterwards the ruins of Dougga about 4 miles distant. Unfortunately for our plan a new road is in process

of construction along the route of the old bypath, which has been totally destroyed, rendering Dougga inaccessible, except on foot. In a year the new road will be finished, and as it is a part of a national route it will be all that an automobilist could reasonably wish to travel over.

When it is practicable a visit to Dougga should not be missed; in fact it is well worth a special journey from Tunis, and many make it. The present inhabitants are Arabs living in miserable huts, but the ruins of the old Roman city or Thugga, which was founded by a colony from Carthage, are among the most notable in this part of Africa. One of them, the Temple of Jupiter, Juno, and Minerva, dating from the reign of the Emperor Marcus Aurelius, is well preserved and is one of the most beautiful relics of antiquity left to us. Other noteworthy monuments are the Theater, the Triumphal Arch, the Mausoleum, the cisterns, and a noble aqueduct that is no doubt part of that which anciently conveyed water to distant Carthage.

From Teboursonk to Tunis is 101 kilometers, and as the country traversed is flat and without interest and the road very good we covered the distance in a little more than two hours. When about 8 kilometers away, after climbing a slight hill, we came in sight of Tunis, nestling around the head of a deep bay almost land-enclosed. It gleamed white in the sunshine and a dozen minarets lifted their slender spires, but as the city lies very low and presents no prominent features it was difficult to distinguish it clearly from the neighboring towns of Carthage, La Marsa, and La Goulette. At 3:30 P. M., of Sunday, March 31, our long journey of more than 1,500 kilometers (934 miles) from Algiers ended at the Tunisia Palace Hotel, the best in Africa outside of Egypt.

Better Roads but Poorer Scenery in Tunisia.

The general aspect of Tunisia is that of a more developed country than Algeria. The population seems larger, the methods of tillage less primitive, the people more prosperous, the surface less rugged and mountainous, and, what is more important for automobilists, the roads are well planned from the engineering point of view and nearly always in first-class condition. As far as scenery is concerned, it is not nearly so attractive as Algeria—in Algeria we were never once out of sight of mountains—but for comfort in motoring it is much superior.

Stopping for lunch at the high-lying village of Ain Drahan, we reached the railroad again at Souk-el-Arba at 4:30 P. M. Here we found a comfortable little hotel (Hotel du Commerce), and having learned that decent accommodations could not be had between Souk-el-Arba and Tunis, 194 kilometers distant, we decided to remain overnight and finish our journey next day.

At the drug store at Souk-el-Arba gasoline may be obtained at the comparatively moderate price of 50 centimes a liter (about 40 cents a gallon). Here, as throughout Tunisia, the only gasoline sold is "Pratt's Naptha," which is put up in large tin cans holding 18 liters (5 gallons). It is necessary to fill up the reservoir here, as no more is obtainable before reaching Tunis, where the price is higher unless a special bargain is made.

Twenty-two kilometers beyond Souk-el-Arba on the road to El Kef is the small Arab village of Nebeur, and three kilometers beyond this village a new-made road leads sharply to the left. This road, recently opened, is the "cut-off," and its 7 kilometers save 28 kilometers and a long and hard climb to El Kef,

THE "SHIP OF THE DESERT" AND HIS PILOTS.

NEW WAYNE "30" IN COMPLETE RUNNING ORDER.

IN accordance with a previously adopted policy, the makers of the Wayne cars, the Wayne Automobile Company, Detroit, Mich., announce that, for the season of 1908, they will devote their entire attention and energies to the production of a single model. This will be known as the Wayne "30," and while it will be supplied either as a touring car or roadster, or as a closed car, the chassis construction and details will be identical throughout in every case, except of course where required to conform to the purpose of the model in question, such, for instance, as the additional rake given the steering column, placing of seats and similar details in the case of the roadster.

**Motor Details.**—Where the power plant is concerned, the standards set by the Wayne company's designers and adhered to consistently for the past two seasons, will again be followed, as having thoroughly demonstrated their fitness. The cylinders are of the best gray iron and are cast in pairs, with the water-jackets integral. The valve-seats are also made integral with the cylinders and long flanged gray iron guides are pressed into seats in the cylinders. The valves themselves measure 1 3/4 inches in diameter and consist of nickel-steel heads electrically welded to machine steel stems. The cam-rollers are in forked lifters with the ends projecting above the roller forks to enter slots in the flanged lifter-guide bodies. The pistons are of the usual Wayne construction and are made gas tight with the cylinder by four eccentric cut rings above the piston pin, while lubrication is facilitated by cutting three oil grooves in the lower part of the piston.

The connecting rods are drop-forgings with bearings consisting of Parson's white bronze half boxes, as are also the main or crankshaft bearings. The latter, as well as the camshaft bearings, are attached to the upper half of the aluminum crankcase, the

lower part serving merely as an oil pan. The cams are made separately and are not pinned into place on the camshaft until the motor has been properly timed, thus insuring their accurate setting. The crankshaft timing gears are of steel and are enclosed in the crankcase, where they receive the benefit of the splash lubrication. The valves are all placed on one side and are operated by the direct lift method. Ignition is of the high-tension type, using the familiar four-unit coil mounted on the dash, and with accumulators as the source of current, while a mechanical force-feed oiler takes care of the essential of oiling, the main bearings being provided for by special leads from the oiler as well as by splash, in the crankcase, the oil-pan of which is suitably divided.

Cooling is provided for by a vertical tubular radiator of efficient design, consisting of a large number of small tubes and copper plates, the circulation being maintained by means of a gear-driven, two-pinion pump. This is supplemented by a fan. Considerable attention has been devoted to the matter of making every part of the motor as accessible as possible.

**The Car's Foundation.**—It is a question whether the motor or the chassis foundation, which is in turn the foundation of the entire car itself, is of greater relative importance, though logically the chassis frame and running gear should come first in a description. In the case of the Wayne "30" this consists of a pressed steel frame of the standard channel section of a heavy gauge of steel, substantially reinforced by gussets and cross pieces. The spring eyes and hangers are drop-forgings. Both the power-plant and transmission are supported directly from the main frame, weight being saved by the elimination of a sub-frame. The four supporting arms of the crankcase extend to each side members of the frame

PLAN VIEW OF CHASSIS, WAYNE "30"

WAYNE "30" ROADSTER FOR 1908, BUILT ON STANDARD WAYNE CHASSIS.

and are flanged to hang on top of the latter. The forward cross-member is of channel iron and is dropped 5 1-2 inches to receive the radiator, which is thus relieved of all destructive side strains tending to twist it from its foundation, and sooner or later causing bad leas. The suspension consists of semi-elliptic springs of substantial size at all four points and liberal-sized tire equipment is provided. Special attention has been devoted to the matter of brakes, two independent sets being provided. Both are located in special drums on the rear hubs, these drums being of pressed steel, measuring 12 inches diameter by 2-inch face. The inner faces of the drums are acted upon by an equalized set of internal expanding brakes actuated through toggles, while the external contracting brakes on the outer faces of the same drums are of the Raymond type. Both the external and the internal shoes are faced with camel's hair felt, and either pair of brakes is designed to have a high factor of safety, making it capable of holding the car under the most difficult conditions, independently of the other set.

**The Transmission.**—The first step in the transmission of the power to the road wheels consists of a clutch of special design. It is in the form of a cylindrical drum cast integral with the flywheel and is of the internal expanding type. A leather-faced band pivoted at one end forms the engaging member. It is attached at the meeting end of flywheel turning direction, so that the movement of the flywheel tends to disengage the clutch. The engaging spring is only set at about 20 pounds pressure, so that the clutch is readily disengaged by a very slight pressure on the pedal through the medium of a sliding wedge.

The gear-set is of the sliding type with selective method of operation, all the pinions being of specially treated chrome-nickel steel, as is also true of the squared shaft on which they slide. They are cut of six pitch, but only to a depth equal to an eight-pitch tooth, thus giving a short, thick tooth especially adapted to withstand the hard service an automobile gear-set is always called upon to perform. The gear-box is conveniently located on the rear axle following out the plan of arrangement adopted by the designer of these cars on previous models, and which has been found to be so successful. Connecting the clutch and

gear-set is a 1 1-4-inch solid steel shaft, 36 3-4 inches long and with self-oiling and dust-proof universal joints of special design at each end. While joints are an absolute necessity in such situations to compensate for the relative movement of the different parts of the car when traveling rough roads, or passing over obstructions, the design of the Wayne "30" in this respect is such that the maximum propeller shaft angle is but 2 1-2 degrees, and the shaft is practically level with normal load.

Realizing the importance of this essential, particular attention has been paid to the design and construction of the steering gear. It consists of an external right-hand thread and an internal left-hand thread, made on the steering shaft at its lower end and integral with the steering column proper

and a nut moving on the latter. The movement set up here is communicated to two bellcrank levers—that is, the steering arm has a double bellcrank end, taking two compression links, one at each end in crutch seats, one compression link being pressed by the exterior thread nut movement and the other by the internally threaded screw plug. The thrust is taken up by a special ball-bearing, and by adjusting the cone of this bearing all lost motion in the steering action can be readily and accurately compensated for—an adjustment of the greatest importance, as even the best of steering gears will wear loose in the course of time and become a source of danger.

The gasoline tank is of the gravity feed type and is located under the forward seat. It has a capacity of 16 gallons, thus giving the car a wide traveling radius. As the mechanical oiler, which is bolted directly to one of the supporting arms of the motor, holds three quarts of lubricant, there is no extra tank provided.

The touring car body is of the straight-line type and is made of sheet aluminum and steel put on over wooden forms, the former providing a surface that can be japanned. It has a normal capacity of five, but with the addition of the extra folding seat in the tonneau has a seating capacity of seven persons. The runabout body is of the same construction.

OPERATING SIDE OF NEW WAYNE "30" MOTOR, SHOWING COMPACTNESS OF POWER-PLANT.

MODEL B, 40-HORSEPOWER CONTINENTAL, DESIGNER JOHNSTON IN REAR SEAT.

AN American car built after the best foreign standards, briefly suffices to describe the Continental, which claims New Haven, Conn., as its birthplace, with C. S. Johnston as its designer and builder, as well as its driver, as he has been a familiar figure in most of the competitions of the past season. To build and market the car in commercial quantities, the Continental Automobile Manufacturing Company was organized and has established a factory at New Haven. This concern has recently been admitted to the ranks of the American Motor Car Manufacturers' Association or, more familiarly, the "independents."

For the coming season, several models will be marketed, a standard four-cylinder touring car naturally forming the mainstay of the line. This is known as Model C and has a 120-inch wheelbase, 34 by 4-inch wheels and tires, six-passenger body of the familiar straight-line type, and lists at \$3,000. With the motor placed farther back on the frame and with a special three-passenger semi-racing body, the same chassis is known as Model B, and will be the 1908 Continental roadster, listing at \$2,700. The line will be completed by a 50-horsepower four-cylinder model and a 40-horsepower six-cylinder model, which will be known respectively as models D and E; 12 of each of these cars will be built on special order during the coming season. In Models B and C, which will, in consequence, form the bulk of the cars to be turned out, the motor dimensions are 4 1-2 by 5 1-4-inch bore and stroke, developing 40 horsepower at 1,000 r. p. m., although the car is nominally rated as 28-32 horsepower. The cylinders are cast separately, the valves all being interchangeable and mechanically operated. They are nickel-steel die forgings.

while the crankshaft, which is slightly offset, is of high-grade steel machined directly from a solid billet. There are five main bearings of liberal size, Parsons' bronze being the material employed. The lubrication in this model is of the splash type, fed by a mechanical force-feed lubricator placed under the hood so that the sight-feeds may be seen through the dash. In Models D and E, splash lubrication, fed by siphon jet in connection with an oil-pump placed in the crankcase, will be employed.

The clutch is of the multiple disc or ring type, of very compact and simple construction, running in an oil bath, and is bolted directly to the flywheel, occupying but little space. It consists of but five rings, two of which are of phosphor bronze and three of steel. A heavy, helical spring serves to engage the clutch, which is maintained in its position by bell hangers. The gear set is of the sliding type with selective operation and is of familiar standard design. It is enclosed in an aluminum housing and its pinions and shafts are of specially hardened chrome steel, running on Hess-Bright ball bearings. Final drive is by propeller shaft through double universals, and the rear-axle unit is fitted throughout with Timken roller bearings.

Among the special features of the car are its braking system and its ignition. The former consists of four powerful independent brakes which may all be operated simultaneously, or any one of them separately. The first is a 10-inch drum with 2-inch face, located on the propeller shaft just back of the gear-set, and is operated by a pedal. Just in front of the gear-set housing is a second small brake in the line of the transmission which is operated in connection with the clutch and facilitates gear-changing. The reg-

CONTINENTAL AS SEEN FROM FRONT.

ular running brake operates on a 12-inch band with a 2-inch face, while the emergency brake has a 14-inch band with a 2-inch face, a camel's hair band acting against steel. As a regular equipment, the models in question are fitted with an accumulator and set of dry cells in reserve, acting through a standard timer and set of four unit Lacoste coils on the dash. But for an additional charge of \$150, a special magneto of the firm's own design and construction is fitted. This is of the high-tension type with coil, and is extremely simple, provision being made for operating on either the magneto or storage cells, merely by throwing a switch a single set of plugs and wiring being employed for both systems, though the makers guarantee it to be as easy to start on the magneto as with the battery, as the motor is fitted with a special compression relief and can be easily spun by hand at a good speed.

From the foregoing it will be evident that no attempt has been made to incorporate new or radically different ideas into the construction of the car, which is, as a whole, extremely simple, compact and practical, representing, as it does, the concrete materialization of what its designer has learned by close observation in handling the best cars of both foreign and American makes during the past five years. It is noticeable that the best foreign lines that have come to be regarded as standard to a great degree the world over have been adopted in the design of the Continental. For instance, the honeycomb radiator is placed slightly to the rear of the 2-inch I-beam axle, and this, together with the car's long, low, straight lines, gives it an unusually attractive appearance. The selective type of gear-set is equipped with the Mercedes pattern gear-shifting levers, while the 25-gallon gasoline tank is placed at the rear of the car. The entire mechanism is protected from beneath by a sheet-steel pan which has been designed not alone to act in this rôle, but with a view to minimizing the amount of dust raised from the road, as it causes no suction or back-draft.

### MARMON 1908 LINE HAS SEVERAL MODELS.

In accordance with the practice that is coming to be more and more generally followed by American makers, Nordyke & Marmon, Indianapolis, Ind., builders of the Marmon air-cooled cars, announce that their line for 1908 will comprise several models. There will be two standard touring cars, Model G, listing at \$3,000, and Model H, listing at \$3,500. Both are equipped with the 90 degree air-cooled motors evolved by this concern. Model G is a five-passenger car, having a 104-inch wheelbase, 34 by 4 1/2 inch wheels rear and 34 by 4 inch front and equipped with an attractive straight-line type aluminum

COMPONENTS OF THE NEW MARMON AIR-COOLED CYLINDERS.

body. It is provided with a disc clutch, selective type of sliding gear set, shaft-drive and roller-bearing steering column. Model H is also a five-passenger car, but has sufficient room in the tonneau for two extra seats to accommodate seven in all. Its wheelbase is 114 inches, while its running gear is the same as Model G, quick detachable rims and tires being used in both cases, while its mechanical features are also the same. It is provided with a cast aluminum body designed in a combination of straight-line and curve effects.

The Model H will also be furnished with a four-cylinder vertical water-cooled motor, the cylinders measuring 5 by 5 inches, the remainder of the chassis being the same as when equipped with the standard Marmon air-cooled motor. The water-cooled motor is of Marmon design and is closely patterned after standard practice in every respect, with long connecting rods, large valves oppositely disposed and mechanically operated, magneto ignition, Marmon oiling system and other up-to-date features. Where the air-cooled motors are concerned, the numerous features characteristic of the Marmon design and construction as embodied in this special type have practically all been retained, with the exception of one radical improvement on which the makers dwell to a considerable extent in their announcement. The most prominent of these features are the 90 degree placing of the cylinders, the Marmon system of lubrication through the hollow crankshaft, and the double three-point suspension whereby the power plant is on one frame and the body on another.

To these has been added an improved form of two-piece cylinder construction. Instead of being cast in one piece, the new cylinders are now made with detachable heads. The latter are cast with a liberal provision of radiating flanges and contain the exhaust and inlet valves and ports, the head as a whole being secured by four long studs passing down through the cylinder flanges and into the crankcase, the nuts being placed on top. This construction eliminates the bother of separate valve cages, reduces the number of joints and gives unusually easy access to the valves, as well as to the interior of the cylinder and the top of the piston head when necessary to remove carbon deposits. The head joins the cylinder just above the piston stroke and is seated on a large copper-asbestos gasket. Removable valve stem guides are set in the heads, the rocker arm support being held to the head by three studs with nuts and lock washers. The head is tapped for the spark plug and priming cock and the exhaust and inlet ports are threaded for elbows; once the latter are in place it is unnecessary to disturb them. The exhaust manifold is attached by flanges bolted to the elbows, while the intake is secured with a large brass union, this manifold being specially designed to deliver a uniform mixture to each of the cylinders.

With the construction above outlined, it has been found that the motor runs much cooler and valve noise is reduced to a minimum. At the end of a continuous 3,000-mile test, covering a period of three weeks' driving, the cylinder heads were removed and they were found to be remarkably clean, with the valves in perfect order. In addition to the changes mentioned, a number of minor details have been refined here and there as the result of experience, so that the Marmon air-cooled motors for 1908 will be better than ever.

THE NEW MARMON AIR-COOLED MOTOR WITH SEPARABLE HEADS.

LATEST FOUR-CYLINDER ADDITION TO THE MAXWELL LINE FOR 1908.

IN connection with the appearance of the Maxwell line for 1908 an announcement of unusual interest is made. It concerns the advent of a new four-cylinder, 26-horsepower touring car of standard type and equipment to sell at \$1,750. The 12-14-horsepower Maxwell runabout and the 16-20-horsepower two-cylinder opposed car will be as prominent factors as ever in the line, the latter being more generously equipped than formerly. In addition to the three brass oil lights, horn, tools and tire repair outfit, a top, gas lamps and generator are now included, despite which the car will still continue to list at \$1,450. The runabout, officially known as Model LC, will also be listed the same as previously, viz., \$825. The line is completed by the Model M, 40-horsepower touring car.

Interest centers chiefly in the new Model D, 26-horsepower car, the power-plant of which is of the unit type, so long a distinguishing feature of the Maxwell two-cylinder cars. In this form of construction the motor, clutch and gear-set become practically an integral unit and as such are not subject to the damaging stresses which frequently cause disalignment where these essentials are mounted separately, permitting relative movement between them. The motor is of the standard, four-cylinder vertical type, the cylinder dimensions being 4 1-4 by 4 1-2 inches, while the motor rating is based on the very conservative speed of 800 r. p. m. The cylinders are cast separately, making possible the use of five liberal-sized bearings, the inner three of which are formed by the crankcase compartment walls. Four good-sized hand plates are provided on each side of the crankcase, making it easy to reach and adjust any part of the interior mechanism of the motor without dismounting it or some other part in order to get at it. The valve chambers are of liberal proportions and are of the outboard or extension type, cast integral with the

cylinders, while the valves themselves are all mechanically operated. The crankcase and the gear-set housing consist of a single aluminum casting, so that the power-plant entire is placed on a three-point suspension, thus giving the car great flexibility and a large capacity for enduring the kind of roads usually met with in this country.

The gear-set is of the sliding type with progressive operation, providing three speeds forward and reverse. Between it and the motor is interposed a multiple disk clutch consisting of 19 plates of a size affording an amount of friction surface greatly in excess of all reasonable demands. It is fully encased and runs in a bath of oil. An interlocking device prevents the shifting of gears without disengaging the clutch so that even an inexperienced operator cannot damage this essential of the car. Final drive is by propeller shaft through two universal joints of the cross type and which are equipped with a special form of oiling device. These crosses are designed to hold a quantity of oil, thus making lubrication automatic for long periods. The live rear axle revolves in a tubular housing of drawn steel, perfect alignment being insured by a special thrust bearing. The frame is of the usual channel section, pressed steel construction, tapering at the ends to accommodate the spring yokes, while the type of sheet metal body so long a feature of the Maxwell cars has been retained, the upholstery being of good quality leather and hair.

The wheelbase of the new car is 96 inches and the tread standard, while in complete running order it only tips the scales at 2,100 pounds. As a roadster this car is known as Model K, and lists at the same price. The details of the design and construction are the same as those just described, except that the touring body is replaced by a semi-racing type with the divided front seats. In other respects the chassis is identical with the Model D.

Gasolene-  
Electric

COLUMBIA MARK 66-3 LIMOUSINE ON ELECTRIC TRANSMISSION CHASSIS.

INTEREST naturally centers about the "electric transmission" Columbia car, which will form the *pièce de résistance* of the Columbia line for 1908. As regards the others, the 28-horsepower car is continued with a few important changes, as is also true of the electric brougham, in addition to which a new chassis construction in an electric victoria phaeton will be listed, this car also being supplied with an inside-operated coupé body. But the chief stress is laid upon the combination gasoline-electric chassis with its gearless transmission, which under the A. L. A. M. formula is rated at 48 horsepower, its cylinder dimensions being 5 1-2 by 5 1-2 inches, and its normal r. p. m. rate is moderate.

This motor is a new design, its cylinders being cast in pairs, while the valve chambers are designed to occupy the least cubical space consistent with uniform water-jacketing of the exhaust valve seat and guide. Provision has been made for lubricating the inlet valve stem in order to prevent sticking. The spark plugs are set between the exhaust and inlet valves and are located directly in the path of the fresh incoming gases, while they are also waterjacketed. The inlet valves are operated by rocker arms while the exhaust valves are actuated by the direct thrust method, both being placed on the left-hand side of the motor, to which the centrifugal gear-driven pump and high-tension magneto are also attached below the frame line of the chassis. The magneto is a Gianoli, using a single coil and combined distributor and timer, so that both the magneto and battery systems of ignition operate through a common distributor and the same set of plugs.

Where this car is concerned, the greatest interest naturally attaches to its transmission, as it is the only one of its type built in this country. Coupled direct to the rear end of the crankshaft is a continuous-current generator of the ironclad type and extremely compact in form. The fields of this generator, which weigh considerably more than the ordinary flywheel, act in this capacity, as they are fast to the motor crankshaft, while the generator armature is coupled to the forward end of the propeller shaft, thus constituting the generator an electric clutch. As the fields revolve, they drag the armature round after them and the latter transmits the energy thus imparted to it

directly to the rear-axle driving unit, which is of the standard type so long a feature of the Columbia cars. However, as there is always more or less slippage between the fields and armature in such an arrangement and as the latter does not provide a sufficient range of speeds or starting torque, an electric motor is mounted on the propeller shaft directly back of the generator. The slippage in question does not manifest itself as heat, as in the case of a friction clutch, to which it is analogous, but takes the form of electric current which is utilized in the motor just mentioned.

Changes in speed are all effected by means of a small controller handle similar to that used on electric street cars, there being five forward and two reverse speeds, the wiring of the controller being

so arranged as to make different combinations with the generator fields and armature and the same essentials of the motor in order to obtain the various changes of speed. The driving effort of the engine can thus be multiplied greatly and the maximum effort of which the combination power plant is capable may be used continuously even with the car at a standstill, as the revolving field generator forms a clutch which may be slipped continuously and uniformly, and which will deliver the result of this slippage as electric energy instead of in the form of wasted heat. The control involves no change in the mechanical relation of the motor to the rear-axle driving unit, and in shifting from point to point, the driving effort is not disconnected from the bevel pinion, even momentarily. Only that portion of the energy developed by the motor which is represented by the slippage of the armature and field of the generator is transformed into electric energy, so that the makers figure that the transmission has an efficiency of 95 per cent., which is unusually high. The capacity of the electric clutch generator and motor in this system is about four times greater than it would be with a generator and motor acting in their usual capacities. That is, this system will transmit and control the power of the engine with one-fourth the weight and far greater efficiency than if all the power of the engine were used to drive the generator, which in turn delivered it to the motor to be transformed into mechanical energy, as too great a percentage is wasted in such a system.

PLAN OF GASOLINE-ELECTRIC CHASSIS.

THE RACY-LOOKING RAMBLER ROADSTER FOR 1908.

NOTHING that will be placed on the American market in the shape of low-priced car during the coming season will show the hand of progress to any greater extent than is revealed by the design of the new Ramblers. The Jeffery designers have ever strained the last point to give the purchaser of a Rambler something more than the other fellow did for the same price, and in the evolution of what will constitute the leader of the Rambler line for 1908 they have succeeded admirably, as a brief review of the car's specifications will show. It is known as Model 34, and will be the only one of its kind that the Rambler factory will turn out during the coming year, although a roadster body will be fitted to the same four-cylinder chassis, the attractive *ensemble* of this combination being evident from the photograph reproduced at the head of this page. The remaining member of the line is known as Model 31, and is a continuation of the two-cylinder horizontal type of chassis with which the success of the Rambler cars has so long been associated. It is regularly fitted with a five-passenger body and the tonneau is detachable, thus making it convertible into a runabout at short notice. It is also listed without the tonneau, and with a torpedo deck as a nonconvertible runabout. Both models have been submitted to severe tests for several months past, and, having thoroughly tried them out, the reproduction of these two types will be undertaken on a large scale, as the entire factory facilities of the large plant at Kenosha, Wis., will be concentrated on them alone, thus greatly simplifying manufacture and insuring greater accuracy.

In the new four-cylinder model there have been quite a few changes in the power-plant. In fact, it may be said to have quite a new motor, embodying numerous improvements over the previous design. This is particularly noticeable where the crankcase is concerned. The latter is of the non-divided type, the crankshaft being inserted through the end of the case with the rear end and center bearings assembled and adjusted. The motor is supported by means of a tube passing through an extension of the forward end of the

case supported on the side members of the frame, while a second transversely placed support is attached to the under side of the rear end of the crankcase. The valves are now set in outward ports or valve chambers and are operated by direct-thrust tappets. As was the case in the preceding model, the gear-set, propeller shaft and rear axle are built as a unit, and to all appearances they retain much the same features. There have been numerous changes of note, however, chief among which is the substitution of a selective type of operation in place of the old progressive gear-box, while both the main and lay shafts are now supported on roller bearings. The rear axle is similarly equipped and, as in this year's model, it is of the floating type. But the wheel hubs are of entirely new design, the brake drums being heavy steel stampings bolted directly to drop-forged hubs. These drums are 13 inches in diameter by 2 1-2 inches face, thus providing 410 square inches of braking surface in the aggregate on the four brakes, two being operated on each drum, one internally and the other externally.

A correspondingly important improvement consists of the adoption of 36-inch wheels with 4-inch tires, so that the 1908 Rambler may well be termed a popular-priced car with all the earmarks of the most costly. The higher wheels give easier riding qualities and provide a better clearance, but the former have been further increased by the adoption of liberal-sized semi-elliptic springs front and rear. The steering pillar is of new design and a larger wheel, 17 inches in diameter, is employed, the old type of Rambler control also having been superseded by the adoption of the standard type of levers set over the wheel on a stationary quadrant.

As a roadster there will be several changes made in the chassis. The car will list at \$2,250 in either type.

The double-opposed motor of 5-inch bore and 6-inch stroke has been improved considerably. The valves have been placed at the side and are now actuated by direct thrust from the single vertical camshaft. This car, Model 31, will list at \$1,400 complete, or \$1,300 with rear deck.

**American Carriage Makers Coming into Their Own.** It was not until the luxurious enclosed body made its appearance on the scene that the carriage maker actually came to a realization of what the coming of the automobile meant to him. With but one or two striking exceptions, prior to that time he regarded it, either with utter indifference as but the passing fad of the moment that meant little or nothing to him, or, foreseeing its ultimate expansion, viewed it in an antagonistic spirit as a menace to his own welfare. Then he awoke to the reality—to the fact that making coach and carriage work and repairs for automobiles was as much a legitimate part of his business as that of continuing to manufacture horse-driven vehicles, just as if a new and powerful rival had not been developed. Time has lent wings to his ambition, and now, instead of the attitude of apathy or antagonism, we actually find carriage builders and dealers constructing and selling the automobile entire. Instead of succumbing to the inevitable with bad grace, as many others who consider their interests menaced by the automobile were content to do, he has accepted the situation and taken advantage of it. During the past fortnight there have been held in New York City the annual shows of two different branches of the carriage-building industry, and in the course of the business meetings held by the various interests concerned, much sound sense regarding the attitude of the American carriage builder to the auto-

mobile was expressed. It may all be summed up in the statement that the carriage builder realizes the permanency of the new style of locomotion, and, instead of combating it, will foster its interests and his own, whether they consist of building costly inclosed bodies, or low-priced power-driven buggies. In a word, he has simply made up his mind to sell automobiles to the same people he has formerly been selling carriages to, and it has taken many carriage builders a long time to realize that, in the main, they are the same people.

**Increasing Numbers of Autoists in the United States.** It seems a pity that some far-seeing legislator with a statistical turn of mind could not have been responsible in earlier days, for some more logical and satisfactory form of registration than is at present in vogue in the majority of the States in this country. Abroad, it is far easier to arrive at an approximately accurate estimate of the number of cars actually in use owing to the systems of taxation in force, which, with the fine-tooth comb method of their application, let few escape. Here, on the contrary, we have a mass of meaningless figures that only serve to confuse, and, as time goes on, they are certain to become worse rather than better. A system of registration that took exact account only of cars in actual use, might be difficult to devise and more so to maintain, but there could be no objection on this score to one that took separate account of pleasure and commercial vehicles, and one that did not swell the registration figures every time a car changed hands.

Present systems of registration serve the chief object for which they were devised—that of identification, as well as could be expected, but the statistics which could thus have been automatically compiled throughout the country at the same time would have been of far-reaching interest, if not of considerable value. In this connection, the vast increases shown by a number of the States is noteworthy, and this is particularly true of the Eastern States, though on a percentage basis, the showing made in the West is truly astonishing. In New York, for instance, which has always led in this respect, the figures have advanced more than 12,000 in the past year, representing an increase of about 1-3; in Indiana, 3,000 have been added, or almost 50 per cent. of the registration of a year ago; and the same is true proportionately of the majority of the Eastern and Middle Western States, while the advances in the Pacific Coast States have been truly prodigious and almost beyond belief.

**One-price Livery Service for Urban Auto Owners.** To one who had sufficient perspicacity to look ahead a few years, it was evident, even in the earliest days of the popularity of the automobile, that the new method of conveyance and the old had considerable in common, and sooner or later, that fact would be recognized and taken advantage of. The Britisher, with his greater conservatism and closer adherence to form, came to that conclusion about a year ago, so that the London autoist has had the benefit of a service, the inauguration of which antedates that about to be enjoyed by his New York confrère. This is the practice of taking automobiles at a fixed rate by the month or year, the charges to cover the majority of those items which have hitherto figured as extras, and the glorious uncertainty of which has made many a prospective owner hesitate at the brink, lest the plunge prove utterly beyond his financial depth. The charge for stabling a horse includes the cost of his maintenance where most of the things pertaining to his welfare are concerned, and there appears to be no reason why the same plan is not applicable to the automobile. In fact, the simile may be carried further, as shoeing is an extra that must be paid for and the same is true of tires under the new arrangement for keeping a car, although evidently with more reason in this case. Storage, cleaning, fuel and oil supplies, and repairing are all provided for, the item of tire maintenance being the only extra, so that the autoist can figure just what the upkeep of his car will cost.

### AMERICAN FIAT MATTERS SOMEWHAT MIXED.

The Hol-Tan Company, Broadway and Fifty-sixth street, New York City, no longer possess the exclusive right to sell Fiat cars in this country, as was made apparent by the announcement this week that a new company, of which E. R. Hollander is the vice-president, would market the Italian car on upper Broadway and at prices somewhat under previous figures. It is known that some time ago differences of opinion arose between the Hol-Tan Company and the makers of the Fiat cars, with the result that each party to the agreement brought suit against the other. It is stated that the Hol-Tan Company has some other very extensive plans in view for the immediate future, and it is known that it made no effort whatever to interfere with Mr. Hollander, formerly one of the concern, from organizing a new company to exploit the Italian car in this country.

The other importers state that they are not disturbed by the reduction in Fiat prices, several of them claiming that they already have their values lowered sufficiently to meet whatever competition exists.

### PITTSBURGH'S ACTIVE DEALERS' ASSOCIATION.

PITTSBURGH, Oct. 14.—Under the title of the Automobile Dealers' Association of Pittsburgh, seventeen of the largest automobile dealers in this city incorporated in August last with a capital of \$5,000, and the organization is now in a highly flourishing condition. Spacious and finely furnished offices have been opened at 5919 Baum street, with a clubroom in connection for the members. A notary public has been retained in order to facilitate the procurement of licenses for the members, and many other conveniences provided. The officers are W. N. Murray, of the Standard Automobile Company, president; W. H. La Fountain, of the Atlas Automobile Company, vice-president; A. L. Banker, of Banker Brothers, secretary, and C. P. Moore, of the Keystone Automobile Company, treasurer. The Show Committee consists of W. N. Murray, W. H. La Fountain, Thomas I. Cochran, and Earl Kiser, Thos. I. Cochran being the show manager. The date has been set for April 4-11 at the Duquesne Garden.

### SPEED REGULATORS TO HAVE DAY'S SPORT.

Motorcycle policemen will modify their usual daily round on Saturday next by a series of races among themselves at the Morris Park track. The program of the meet comprises a two and a five-mile race, a one-mile novelty race for a prize offered by Commissioner Bingham and one mile races for the championship of the Bronx, Brooklyn, Queens and the five boroughs. A number of valuable silver cups have been offered as prizes by prominent automobilists. Theodore K. Hastings will act as starter and Commissioner Bingham will assume the duties of referee.

### A. S. M. E. REGULAR MONTHLY MEETING.

The second regular monthly meeting of the season will be held by the American Society of Mechanical Engineers on Tuesday evening, November 12, in the building of the Engineering Societies, 29 West Thirty-ninth street, New York. Charles R. Pratt will read the principal paper of the evening, on the gearless traction elevator, which is being installed in New York's two skyscraping towers. The subject will be exhaustively treated from the viewpoint of both the architect and the engineer.

### DRAGON CONSIDERING NEW ENGLAND LOCATION.

Boston, Oct. 14.—Officials of the Dragon Automobile Company, including John Kane Mills, its president, Henry Rawle, treasurer, and A. L. Kull, sales manager, have been in New England for the past two weeks investigating several plants offered for a new home for their car. It is contemplated removing the Dragon plant from Philadelphia and considerably extending the capacity of the factory in its new location.

THOMAS FLYER CONVERTED INTO FIRE ENGINE BY A. C. WEBB.

### HOW JOPLIN, MO., GOT AN AUTO FIRE ENGINE.

By a simple but ingenious arrangement A. C. Webb, of Joplin, Mo., has utilized a Thomas Flyer chassis in the building of an auto fire engine. Mr. Webb built his fire engine by placing a rotary pump on two cross frame members in the rear of the transmission, connecting the pump gear with the transmission by a shaft running from one of the auxiliary shaft gears and controlled by a lever placed at the side of the driver's seat. This gear connecting with the pump may be thrown into mesh and the rotary pump started when the scene of the fire is reached. Incidentally, the shifting of the pump gear into commission automatically cuts off the radiator from the motor, water being supplied for the cylinders from a separate feed from the rotary pump. When this gear is again shifted out of mesh, the radiator is automatically connected up with the motor and resumes its duties. It was thought necessary by Mr. Webb to provide this auxiliary water supply, owing to the fact that an automobile fire engine might be forced to stand for hours with the motor going at high speed and the pump in operation.

The first experiments were made at Buffalo, Mr. Webb spending two weeks at the plant of the E. R. Thomas Motor Company. Officials of the Buffalo Fire Department witnessed these tests and were enthusiastic over the results. With a rotary pump smaller than the one now in use on the car, a stream of water was thrown completely over one of the three-story concrete and steel buildings.

EIGHT-CYLINDER MAXWELL, WITH DESIGNER J.D. MAXWELL AT WHEEL.

This new creation of the Tarrytown factory is not designed as a stock addition to an already numerous line, but is for racing purposes, and it is the intention of its constructors to see what it can do in the way of speed on the southern sands this winter. Its power-plant consists of two standard Maxwell four-cylinder engines coupled tandem and its design is practically identical, where the rest of the chassis is concerned, with that of one of the racing Maxwells which was built to take part in the Vanderbilt elimination trials last year.

## BUSY DOINGS IN THE REALM OF CLUBLAND.

### BAY STATERS HAVE GYMKHANA SPORT.

BOSTON, Oct. 14.—The second annual gymkhana of the Bay State Automobile Association, held Saturday afternoon at the Newton athletic grounds, brought out a good list of entries. The honors went chiefly to Walter Schmunk, who drove a White steamer and succeeded in capturing first place in four of the contests. The contestants in the cigar race were required to start their cars at a given signal, drive to a barrel, stop, dismount, and take a match, remount and drive to another barrel, take a cigar and light it, and then drive once around the quarter-mile track. Schmunk's time in this contest was 58 2-5 seconds, just two seconds better than that of his nearest competitor, John L. Snow, who drove a Peerless. Mr. Schmunk also won the backward driving contest, circling the track in 44 3-5 seconds. Mr. Schmunk's third victory was in the barrel-touching event, and he touched all the barrels in 2:13 1-5 seconds. S. H. Baker, driving a Stevens-Duryea "six," was second, and Ralph Coburn with a Maxwell was third. The barrel-knocking-over test also went to Schmunk.

The twelve-miles-an-hour was won by Harry W. Knights in his Pierce Arrow, while A. A. Knights with his Oldsmobile was second and F. A. Hinchcliffe with his Winton took third place. The brake test, in which contestants were required to stop on signal while moving at 15 miles an hour, was won by John L. Snow with his Peerless, which he stopped in 18 feet 4 1-2 inches. Ralph Coburn with a Maxwell was second, stopping in 21 feet 4 1-2 inches. The obstacle race went to Ralph Coburn with his Maxwell. A. A. Knights was second with his Oldsmobile and Walter Schmunk with his White was third.

### DELAWARE'S ASSOCIATION IS GROWING.

WILMINGTON, DEL., Oct. 14.—The Delaware Automobile Association is growing. At the annual meeting, held a few days ago, it was announced that it now has about seventy-five members. Thirty applications were received, which will be acted upon at the next meeting. The annual election resulted in the choice of the following officers: President, John Bancroft; vice-president, Ernest Dupont; secretary, Charles G. Guyer; treasurer, W. C. Jackson. Executive Committee: J. J. Satterthwaite, W. C. Spruance, Joseph Bancroft, F. S. Garrett, and P. S. Dupont.

Complaint having been made about scorching at night on the Wilmington & Kennett turnpike, the managers have decided to keep the gate men on duty until 11 o'clock hereafter, instead of relieving them at 7, which means that toll will have to be paid until 11 o'clock, whereas no toll has been charged in the past after 7 o'clock.

### PHILADELPHIA'S PROGRESSIVE WOMEN.

PHILADELPHIA, Oct. 14.—The erstwhile home of that arch-traitor, Benedict Arnold—"Mount Pleasant," in Fairmount Park—has been converted to the use of the Quaker City's latest and most select organization of women automobilists, which glories in the title "La Moviganta Klaubo," and on last Wednesday afternoon the old Revolutionary mansion was the scene of the gathering of members and friends to honor the opening of the new clubhouse. There are 29 active members of the club at present, all of whom own and are able to drive their cars, besides which there are nearly 50 subscribing members and a long waiting list. Miss Margaret L. Corlies is president of the club, with Miss Frances C. Griscom vice-president, Miss Frances von Lehr Earle secretary, and Miss G. Dilworth Beggs treasurer.

The club had made an effort to purchase the old mansion, but an old ordinance of Councils prohibited its sale because of its historical associations, a feature which, in the eyes of patriotic Philadelphians, makes its sale a practical impossibility.

### INDIANA CLUB DOES EFFECTIVE WORK.

LOGANSPOBT, IND., Oct. 14.—That an automobile club need not confine its attention to cut-and-dried methods of furthering the interests of its members or of the fraternity generally was strikingly illustrated by an incident that will make one Indiana farmer remember the Cass County Automobile Club for some time to come. Miss Winifred Van Buskirk and Miss Laura Howe were driving on the Eighteenth-street bridge recently when a man in a wagon compelled them to stop, leave the car and stand in front of it until he passed, enforcing his demands with a revolver. The matter was kept quiet, not even the police being notified, but Secretary Fred M. Taft of the club undertook a still hunt. Nothing developed for a week or two and the perpetrator of the action doubtless considered it as a closed incident. An account of it was then published in the *Logansport Journal*, and John M. Bowyer, a farmer living south of the city, unguardedly boasted that he had been the hero of the day. One of the club members heard of it, and, taking the victims of the affair in a car, together with Bailiff Frank Livingston armed with a warrant, went to Bowyer's place and arrested him. He was brought before Justice Reid and pleaded guilty, receiving the limit sentence, which cost him a fine of \$48.50.

### MARYLAND AUTOISTS AFTER GOOD ROADS.

BALTIMORE, Oct. 14.—Backed with the hearty endorsement of the Maryland Automobile Association, the Frederick, Carroll, Howard and Montgomery Counties Roads Association, has just been organized for the purpose of obtaining better roads for the State. The meeting was attended by a large and enthusiastic delegation from the four counties, and it is probable that in the near future thousands of dollars will be spent for the macadamizing of the roads of Maryland. The meeting was held at Mt. Airy, and was presided over by Jesse P. King, with William A. Walker, secretary, and W. Frank Burdett, treasurer. These officers, together with Frank I. Lewis and Dr. R. Claud Flout, were appointed to frame a constitution.

### DAKOTA HAS ANOTHER AUTO CLUB.

PARK RIVER, N. D., Oct. 14.—This city has about 25 automobile owners at present, with the prospect of having the number increased steadily in the future. With the object of improving the roads in the outlying districts and particularly those leading into the town, an automobile club has been organized with the following officers: President, Dr. T. E. Waugh; secretary, C. D. Lord; treasurer, J. D. Robertson. The club's membership roll already comprises practically all the town's autoists.

### ROCHESTER HILL CLIMB, OCTOBER 19.

ROCHESTER, N. Y., Oct. 14.—A drizzling rain starting when everything was in readiness for the annual hill climb of the Rochester Automobile Club at the Dugway in Penfield, last Saturday, caused much disappointment to the fifty or more members of the club who were at hand to participate in the events. By common consent of those who had the matter in charge, the hill climb was postponed until Saturday, October 19.

### CLUB NIGHTS RESUMED AT THE A. C. A.

NEW YORK, Oct. 14.—The Automobile Club of America will resume its usual weekly "club night" on Tuesday evenings, and Orrel A. Parker has been appointed chairman of the entertainment committee to arrange for suitable lectures, smokers, and entertainments. It so happens that the first club night this week will take place on Thursday evening, a combination of circumstances making this necessary.

**GARDEN WILL NOT BE STATUELESS THIS YEAR.**

Though the decorators who have charge of the preparations of the elaborate setting that is to transform Madison Square Garden for the reception of the automobile during the A. L. A. M. show, November 2-9, decided not to use plaster as in former years, they will not do away with that valuable adjunct to artistic effect altogether. Some quantity of staff will be used in repro-

ducing the goddess represented in the illustration. The artists have labeled the new deity, and fixed her origin among the famous godheads of the Nile. She is Egyptian, and will visit the Garden during show week in numerous duplicates, looking down from her classical pedestals upon the beauties of the Italian villa, which will be the prevailing theme in decorative effect. The word-builder who wields the pen of publicity so effectively for the Garden show presents a pen picture, so effective of the enchantress, that we yield gracefully and publish his description in full:

"One beautiful Egyptian girl, a college chum of Isis, possibly, is the sole thing in the line of statuary among the decorations that will be seen by visitors to the automobile show in Madison Square Garden. There will be several replications of her along the platform railing on each side of the Garden. The figure is particularly appropriate for the garden scheme of the decorations, as the single robe in which it is draped swirls at the

bottom into eccentric outlines which resemble an inverted lily. The lady wears her hair à la Merode and has an expression of languor as she lightly holds a lotus flower poised on the crown of her head, while a smaller lotus lies upon one shoulder."

"A CHUM OF ISIS."  
Egyptian goddess only statue  
of the Garden show.

**'FRISCO TO HAVE A DECEMBER SHOW.**

SAN FRANCISCO, Oct. 12.—The members of the Automobile Dealers' Association of California came to life last week and held a meeting. For months some of the enthusiastic members have been trying to get the rest of the trade together to discuss many items of importance and interest, but they have been so busy selling cars that it was not until the other night that they found time. The magnet that drew them to the meeting place was a notice that at that time a date for the second annual automobile show in San Francisco would be selected. It was definitely settled to hold the show the first or second week in December, the exact date depending upon what time the most desirable building to hold it in could be secured. A committee was appointed to investigate several offers.

MAX L. ROSENFELD.  
President Automobile Dealers' Association of California.

J. W. Leavitt, president of the association, at a meeting of the board of directors held prior to the meeting of the association, resigned his office on account of pressure of business. When it was found that it was impossible to get him to retain the office, Max L. Rosenfeld, widely known from the Atlantic to the Pacific in athletic circles as an officer of the Olympic Club, was selected to fill the vacancy.

A RAMBLER PARTY OF NEW OWNERS FROM JOLIET, ILL.

**GOOD PLAN FOR INSTRUCTING NEW OWNERS.**

The Joliet, Ill., representatives of the Rambler Company recently hit upon an excellent plan for imparting instruction to new purchasers of their automobiles. Five citizens of Joliet had placed orders for four-cylinder touring cars, all of which were ready for delivery at about the same time. It was therefore arranged that the five customers should visit the factory together, spend a day in inspecting the plant, and travel home by road, each on his own car, with an experienced driver as instructor. The trip of about one hundred and twenty miles was performed most successfully, each owner feeling confident in his machine and his own ability to handle it under all ordinary circumstances. In addition the five owners had obtained, by their visit to the factory, a better knowledge of automobile construction than is usually picked up in several years by the average automobilist. The plan is one that has been tried in scattering instances at various factories, but with few exceptions its execution has arisen from a desire of the new owner of the car to drive it home himself rather than pay freight charges, and has not been done on the initiative of the manufacturer. These trips have varied all the way from less than a day's drive—a matter of but a few hours—up to stretches of 500 or 1,000 miles that lay between the factory and the home of the purchaser, so that it would appear, not alone feasible but beneficial for the maker to recommend this course whenever the customer can be interested in attempting it.

**R. G. HOWELL TO SELL NORTHERNS.**

The R. G. Howell Company, recently incorporated in the State of New York, is about to establish its headquarters at 1657 Broadway, New York City, where the Northern, manufactured at Detroit, Mich., will be handled. In addition to the selling line, an endeavor will be made to provide parts for the numerous Northern cars now in this vicinity. The territory covered will include Greater New York, Long Island, Northern New Jersey, Southern New York, and the western half of Connecticut.

R. G. HOWELL, OF NEW YORK, IN TWO-CYLINDER NORTHERN

## BRIEF ITEMS OF NEWS AND TRADE MISCELLANY

The Auto Accessories Sales Company, of 3919 Olive street, St. Louis, Mo., sales agents and distributors, are desirous of receiving communication from manufacturers of oil and grease pumps, horns, auto clothing, caps, gloves, etc.

L. E. Hoffman, traveling representative for the H. H. Franklin Manufacturing Company, advises that reports from Southern automobile dealers indicate that there will be an increase of at least 50 per cent. in the number of automobiles sold during 1908.

In order to obtain facilities to enable them to turn out cars on the orders already in hand, the Hatfield Motor Vehicle Company, Miamisburg, O., makers of the Hatfield buggyabout, has found it necessary to lease the large machine shop of David Allen, in that city.

A. Auble, of the Akron Auto Garage, left the H. H. Franklin Manufacturing Company's works, Syracuse, N. Y., at 5 A.M., October 2, in a 1908 D touring car and reached Akron, O., at midnight on the same day, making the run of 391 miles in 19 hours, an average of over 20 miles an hour.

In the October 3 issue of *THE AUTOMOBILE*, page 475, it was erroneously stated that the H. H. Franklin Manufacturing Company had five branches throughout the country. It should have read that the Franklin Automobile Company has three branches, one in each of the following cities: New York, Boston and Chicago, the home office being at Syracuse, N. Y.

In announcing the formation of the Oto Sales Company, of St. Louis, in *THE AUTOMOBILE* of October 3, it was stated that Charles E. Halliwell, one of the officers of the company, was formerly St. Louis representative of the Warner autometer. Mr. Halliwell was formerly president of the Kansas City Mirror Manufacturing Company. It is his brother, W. H. Halliwell, Jr., who is representative of the Warner Instrument Company, as sales manager for Missouri and Kansas.

Following the erection of the new Rainier factory at Saginaw, Mich., some changes have been made in the personnel of the Rainier Motor Car Company. At the annual meeting in New York the following were elected: John T. Rainier, president and treasurer; Paul N. Lineberger, vice-president and general manager; James G. Heaslett, second vice-president and chief engineer; Directors: John T. Rainier, Paul N. Lineberger, Jack A. Rainier, Harry T. Wickes, George C. Comstock.

The newly established collection department of the New York Automobile Trade Association is already justifying its existence, and as the association now numbers sixty-three of the largest garages and dealers in the city, it is probable that the bulk of the collection business in the metropolitan district will be handled through this efficient department of the association. The latest addition to the membership roll is the Charles Setzer Garage at 561 Pelham avenue, and the association is now the largest of its kind in existence.

The Newby Automobile Company, Newcastle, Ind., has just been organized

with a capital of \$15,000, and will shortly take over the retail business of J. A. Newby, Mr. Newby being one of the incorporators of the new company. The latter will erect a handsome garage in the near future, continuing the business in the interim at the Newby garage on West Broad street. The Maxwell cars are handled at present and it is the intention to establish a general sales agency for practically all of eastern Indiana. The directors are George M. Connor, J. D. Maxwell, Benjamin Briscoe, J. A. Newby and A. D. Ogborn. The officers are J. D. Maxwell, president; George M. Connor, vice-president; J. A. Newby, secretary and treasurer.

### RECENT BUSINESS CHANGES.

The name of the Linkroum-Smelser Automobile Company, of 17 Bank street, Newark, N. J., has been changed to the Linkroum Automobile Company. The business will be continued by W. H. Linkroum, with S. H. Stern, former manager for E. Lamberjack & Company, of New York, as local manager.

Having severed their connections with the National Auto Top Company, G. A. Mackey, G. L. Wilson and E. Eisenstein have organized the New England Auto Top Company and will continue in the manufacture of automobile tops, slip covers, folding wind shields, auto upholstery and painting at Broadway and West Fifty-fourth street, New York City.

The Capital Automobile Company of Indianapolis, Ind., which was organized about one year ago, has been reorganized, President R. J. Irwin retiring from the company. It is understood that Mr. Irwin is to head a new company that will handle a large line of high-grade automobiles. The Capital Automobile Company had the Indiana agencies for the Overland, Reo, Jackson and Wayne this season, but in 1908 will carry the Olds and make a number of changes in their old line.

Two more important trade changes are announced in Boston. The first is that the Harry Fosdick Company, which last year handled the Thomas, will have the Springfield, with New England as its territory, the coming season. The second announcement is the formation of a new company to handle the Thomas line. This is the Whitten-Gilmore Company, consisting of Charles E. Whitten, a well-known dealer of Lynn, and Ernest A. Gilmore, now connected with the White Company in New York and formerly manager of the Rambler branch in Boston.

### NEW AGENCIES ESTABLISHED.

The Hercules Auto Specialty Manufacturing Company, makers of the Hercules shock absorber, has just opened a salesroom at 1038 South Main street, Los Angeles, Cal., and will carry a line of auto specialties in addition to their own product.

### PERSONAL TRADE MENTION.

L. J. Sackett, until recently with the Simplex Automobile Company, of New York City, has recently severed his connection with that concern to go with the Allan-Kingston Motor Car Company,

of Kingston, N. Y., and will represent the latter on the road.

Percy Owen, president of the New York Automobile Trade Association, and American representative of the Bianchi cars, is being congratulated on the arrival of a future president for the trade association in the person of Percy Owen, Jr., who arrived during the past week.

The successor to Milton J. Budlong, who retired from the presidency of the Electric Vehicle Company last August, has been selected in the person of Walter G. Henderson of Philadelphia, who has for some time been affiliated with the company as treasurer. Mr. Henderson will probably take up his residence in Hartford, in which city he is well known. After a trip to Europe, Milton J. Budlong has returned to Hartford. Reports are abroad that he will quit the automobile field entirely.

### INFORMATION FOR AUTO USERS.

**The Velocimeter.**—This is a new instrument for indicating the speed alone of an automobile that is being placed on the market by the Connecticut Gauge Company, Norwich, Conn. It works on the centrifugal principle and is equipped with a large open face, round dial, calibrated in divisions representing five miles, this scale having been found perfectly satisfactory for ordinary road work. The case inclosing the mechanism is handsome and symmetrical in appearance, highly finished and is water and dust-proof. As in telling time, the driver of a car fitted with a velocimeter is easily able to tell the speed by the relative position of the hand, whether he can see the figures on the dial or not. The driving mechanism consists of the well-known Coates unit-link style of flexible shafting; the gears are hard brass with cut teeth and are held in place by

CONNECTICUT GAUGE COMPANY'S VELOCIMETER.

a specially designed universal clamp fixture, adapted to fit any make of American car without alteration or special work. The intention of the makers has been to produce an instrument of this kind at a popular price, but neither the quality of the material entering into it nor the workmanship has been sacrificed on that account.

# THE AUTOMOBILE

VOL. XVII

NEW YORK—THURSDAY, OCTOBER 24, 1907—CHICAGO

No. 17

THE first of the shows is in progress. It began this afternoon with a private view to members of the Automobile Club of America and their friends. To-night the general public was admitted, and came in overwhelming numbers to see what manner of cars are included in the 1908 productions of those makers who take no reckoning of the name Selden. With few exceptions, these "independents" are segregated under the banner of the American Motor Car Manufacturers' Association, and this organization supplies the backbone of the "Club" show in the Grand Central Palace. And it is a mighty reassuring backbone that the Reeves line-up presents, for it includes cars that range in value from the most reasonable-priced buggy type up to the heavyweight tourer which carries seven and can crowd in several more if required, and many want cars thus provided.

When one reminisces a bit and goes back to that corner in the bicycle show of the winter of 1898-'99, which contained all there was to illustrate to the public what was meant by "automobiling," it brings a startling realization of the progress of a great industry. Now Madison Square Garden is appropriated entirely by the Seldenites, while the Palace is filled from cellar to garret with the vehicles of the "independents." And in neither of

these exhibitions is the forerunner to be found this time. The products of European makers are to have a separate setting later on. All this in the short space of less than a decade, and we appear to be only on the threshold, for, in addition to the users of pleasure cars, the call for autocabs and autobuses and farmobiles is scarcely heeded, to say nothing of the other demands of the commercial vehicle field.

It is true that the replacement of the horse should be gradual, and not forced, but it is as certain as the rising of the sun on the morrow. The shows tell the story convincingly, and this exhibition of the "independents" indicates more the growth of the industry than does the event of the Seldenites, whose ranks are kept limited as a result of the policy followed. Not a few new names are to be seen in the Palace, and of those who were there a year ago all are present with few exceptions. It is inevitable that some will fall by the wayside in any field, but the causes belonged to the concerns individually and not to the industry itself.

The Motor and Accessory Manufacturers constitute a good barometer of the trade, and in the Palace their members are more numerous than ever before. Besides, there are those outside who sell things that figure in some way in the making of cars or their use. It is a big list.

The management of the "Club" show has never been extravagant in the matter of decorations, but it would take a good many thousands of dollars to give the Palace a dressing that would hide its ugliness. The futility of the effort may have caused the subject of decorations to have come in for even less attention than a year ago. An effort has been made for an autumn out-of-door effect, and the vari-colored foliage utilized partially

accomplishes what seems to have been desired. The green background of the past again fits into the picture, while the dark red floor covering blends into the scheme. The removal of obstructing partitions has improved the exhibiting spaces and one gets a better idea of the magnitude of the show.

October dates caused not a few exhibitors some difficulty in arriving at the Palace with a completed exhibit, and it is apparent that a fortnight or more might have been employed by some of the firms in bettering that which they show to the throngs of interested persons.

But contrast this for a moment with the result that would have met the first-nighters of a few years ago had an attempt been made to hold a show in October, or, for that matter, in December, as the average maker had to move heaven and earth to be able to come to a January show, usually after it was well under way, if half-empty floor spaces could constitute such a condition, and dragging his exhibit in with him much in the same manner as the farmer gets an unruly prize heifer before the judges of the county fair at the last moment. Instead of the forlorn-looking gaps in the line of exhibits that were seldom filled up until half the show week had passed—some of them not at all—long ranks of polished chassis and complete cars are to be seen in every direction.

If this were a complete representation of the entire American industry, it would indeed be an imposing sight, but when it is realized that, taken altogether, this immense aggregation of cars and sundries is but a part of the total, the mind can scarcely grasp the significance of it. It is next to impossible to take in the fact that practically all of these makers have come into existence in less than half a decade, and that every car in the great exhibition building is of American origin and construction.

And it is in this respect particularly that the present show at the Palace will go down into history as the first of its kind. In 1900 raking the entire metropolitan district and the outside territory included with a fine-tooth comb failed to materialize more than a mere handful of cars, but one or two freakish specimens of which could lay claim to being American. The remainder were of foreign make and the property of private owners. The latter soon dropped out of sight as supporters of automobile shows, but for several years thereafter the foreign makers formed the mainstay of every show held in in the East, so that this first all-American really marks an epoch in the history of the home industry. Every one of this seemingly endless collection of cars of all sizes, types and prices is the creation of American skill and American material and they serve to show how completely the pupil has outgrown the master of but a few short years ago, for many of these cars have their counterparts running on foreign roads as the property of foreigners.

The unanimity with which all makers of cars above a certain size list permanently enclosed models also furnishes a strong contrast to the automobiles that formed the bulk of the exhibits but a few years ago, and accentuate very markedly the fact that the automobile is as much an all-the-year vehicle as the carriage.

Quite the most significant feature of the show, regarded from the point of view of the cars alone, is the collection of "buggyabouts" which are now brought together for the first time at any Eastern show. This indigenous product of the West has sprung into being in such a very short space of time, comparatively speaking, and it has been confined so closely to the home of its origin, that many here in the East do not realize its existence. Two years ago there were not more than two cars of this make being turned out regularly; now there are a dozen or more, and a new firm starts up every month. And this humble high-wheeler is destined to place an entirely new aspect on the pastime of automobiling, which can no longer be justly catalogued as such owing to the fact that a very large proportion of all the cars in use is employed as necessary means of transportation.

The bewildering array of accessory makers and dealers forms a fitting background to the great collection of cars and serves to give some idea of the vast amount of capital and labor involved in the manufacture of articles merely subsidiary to the car itself.

## EVENTS DURING PALACE SHOW.

### THURSDAY, OCT. 24:

2 P. M.: Private view of exhibition for A. C. A. members.

### FRIDAY, OCT. 25:

Evening: Merchants' Night.

### SATURDAY, OCT. 26:

Evening: New York City Officials' Night.

Evening: Smoker, Automobile Club of America.

### SUNDAY, OCT. 27:

All Day: Open house at Automobile Club of America.

### MONDAY, OCT. 28:

2 P. M.: Convention of Maxwell dealers, Murray Hill or Manhattan Hotel, to be followed by a dinner at 5:30 P. M.

Evening: Engineers' Night.

### TUESDAY, OCT. 29:

1 P. M.: Second annual show luncheon of the American Motor Car Manufacturers' Association at Hotel Manhattan.

Evening: Society Night. Admission \$1, instead of 50 cents.

### WEDNESDAY, OCT. 30:

10 A. M.: Meeting directors of Motor and Accessory Manufacturers, Inc., at Hotel Manhattan.

3 P. M.: Meeting A. M. C. M. A. Committee.

3 P. M.: Meeting A. C. A. Board of Governors.

7:30 P. M.: Dinner of Fairweather Club at Reisenweber's.

Evening: Military Night.

## A. A. A. MEETINGS DURING THE SHOW.

### WEDNESDAY, OCT. 30:

10 A. M.: Conference of representatives of A. A. A., N. A. A. M., A. L. A. M., A. M. C. M. A., and I. A. S., for the purpose of considering the advisability of automobile racing upon one-mile or less circular tracks, No. 437 Fifth avenue.

4 P. M.: Conference of representatives of A. A. A., N. A. A. M., A. L. A. M., and A. M. C. M. A., discussion of plans for the general good of automobiling, No. 437 Fifth avenue.

### THURSDAY, OCT. 31:

10:30 A. M.: Meeting of Executive Committee A. A. A. Board of Directors.

3 P. M.: A. A. A. Legislative Convention to be held in Convention Hall of the Grand Central Palace (take elevator Forty-third street entrance). The meeting will be presided over by President William H. Hotchkiss and Charles Thaddeus Terry, chairman of the Legislative Board.

## AERONAUTICS STRONG FEATURE AT PALACE.

Arrangements were made to make the aeronautical section of the Grand Central Palace automobile show the most complete ever held in this country. The Aero Club of America arranged for the presence of the entire Jamestown exhibit to be shown intact, and this was supplemented by two or three score individual exhibits not shown in the South.

In the balloon section there are ten fully equipped airships and balloons, including Dr. Thomas' *Nirvana*.

The dirigible balloons comprise Santos-Dumont's *No. 9*, lent by the Smithsonian Institution; C. J. Strobel's *Harry Cauldwell*, Captain T. S. Baldwin's *California Arrow*; Julian P. Thomas' *New York*; Captain T. T. Lovelace's *John Wetmore*, and Carl E. Myers' *No. 23*. Heavier-than-air candidates for the supremacy of the heavens comprise a number of novelties, mostly in models. Among those who contributed to this section are C. Buschner, with a land and water automobile; A. Reidlinger, of Germany, with a German draschen balloon; and model helicopters and aeroplanes by A. V. Wilson, L. H. Hall, Carl Hartman, Wm. Morgan, W. A. Eddy and W. R. Kimball.

# CONCERNING THE FUTURE OF A GREAT INDUSTRY

BY ALFRED REEVES, GENERAL MANAGER, AMERICAN MOTOR CAR MANUFACTURERS' ASSOCIATION.

REPORTS from various parts of the country indicate excellent prospects for the sale of automobiles in 1908. It will not be an abnormal year, but it should be a very successful one for those dealers who practice ordinary business principles in the conduct of their business. While certain things have contributed to make this year an off one in the automobile trade in the East, the West has continued to be optimistic on the future. Of course, some cars have moved with comparative ease, while others have required some effort to be introduced.

ALFRED REEVES,  
General Manager A.M.C.M.A.

Optimism is an excellent thing, but it must not warp our judgment in the careful consideration of the future. New York always discounts the future, and the West must soon feel the money stringency that has affected Eastern conditions for some time. In the opinion of conservative business men, this stringency and general let-up in trade has been an excellent thing, for it is generally admitted that the country has been overtrading and doing a larger business than its capital warranted. A few months easing will be the best thing that could happen, and particularly it is going to impress upon the mind of the automobile manufacturer that conservatism is a keynote worth sounding now and again.

The very bad weather of the Spring, tight money market, the very early shows, and the failure to run the Vanderbilt Cup race, have all affected trade somewhat, but these should all be on the favorable side next year. In my judgment, the first week in December, as we had in 1906, is the best time for shows, for it doesn't affect the Fall business, and yet it is early enough to give the manufacturer an opportunity to get his product out promptly for the Spring selling season.

In my opinion, business had been affected somewhat by the regretful efforts of certain factions in the trade in trying to require a dealer to handle only one make of car, or a car within the ranks of one association. An unbiased view of the situation will make clear to anyone that this has brought into the field

twice as many dealers as were necessary. They have had to pay twice as much rent, have had twice as many salesmen, and have had twice as much overhead expenses of every sort, with the natural result that comparatively few of them have made any money.

I feel confident that the successful dealers of the future will handle three or four different makes of cars in order to make profits commensurate with their investment. Of course this year the independent dealers have had all the best of trade, because they handled the small type of cars that were in such great demand. They have been aided, too, by the broad policy of the American Motor Car Manufacturers' Association, which has done a great deal of good work in the direction of agents. Next year should see a continued big demand for small cars, an excellent sale of the six-cylinders, and good field for the four-cylinders.

J. B. BARTHOLOMEW,  
A.M.C.M.A. Show Committee.

The commercial vehicle is receiving more attention, and those in that line, particularly the makers of the gasoline cars, should begin to receive the rewards due their early educational efforts.

A conservative and thoughtful view of the horizon may show a further elimination of weak concerns, but, if so, it will be on account of inability to raise capital, which has been the trouble with some of the companies that passed away during the present year.

For the good of the industry, there should be a continuation of hill climbs, track and road racing, economy tests, endurance runs, tours and shows, both local and national.

WM. MITCHELL LEWIS,  
A. M. C. M. A. Show Committee

## INCREASING DEMAND FOR THE MODERATE-PRICED CARS

BY BENJAMIN BRISCOE, CHAIRMAN A. M. C. M. A. COMMITTEE OF MANAGEMENT.

BENJAMIN BRISCOE,  
Chairman A. M. C. M. A.

THE automobile business is passing through what I have always considered was an inevitable period in its existence, the differentiation period. I believe that the public who buy automobiles are fast coming to a realization of the fact that they can get automobiles that will do all that they require at a cost of \$2,000 and less, and while there will undoubtedly be some cars sold from \$2,000 and upwards, the proportionate yearly sale, as compared with the lowest priced cars, will steadily diminish.

In my estimation there will be three or four concerns whose cars will become standard as high-priced cars, and there will be a large number of concerns, of course, whose cars will become

standard as the moderate-priced cars. At the outside, I do not believe that there will be in existence over twenty automobile companies at the end of the next year whose business will be really worth while.

As to the demand for automobiles, I believe it will steadily increase; the increase, however, will be proportionately greater for the moderate priced cars.

When automobiling was new, and comparatively few people had them, and when they were bought by a great many people simply to let their neighbors know that they could own one, in other words, when the element of pride entered into the situation to a great extent, big, showy cars served the purpose better than cars of utility. Automobiles have now become so general, and in such common use, that one never raises his head to see who it is that is in the automobile, and so people have come to realize that what they want is a car that will *get there*, rather than one that will excite the envy of their neighbors.

The worth of the automobile has been impressed upon the minds of many who have yet to become owners.

## SATISFACTORY RESULTS OBTAINED BY USERS GENERALLY

By H. O. SMITH, MEMBER OF A. M. C. M. A. SHOW COMMITTEE.

MUCH talk has been going about as to the future of the automobile business. The statement that the automobile is a practical conveyance will probably not be challenged by those who are posted. Therefore it is a plain business proposition, and must be handled by business men on the same general basis as any other line. It will not stand abnormal and unwarranted expense any more than the average standard line.

If in some quarters the automobile business has proved unprofitable, while in others successes have been met with, there is no doubt a reason for both conditions. The automobile business, if it is in a healthy condition, should not afford more than a legitimate manufacturing profit. Abnormal profits tend to encourage extravagance and invite increased competition to such an extent as to make possible the danger of overproduction.

As in any other manufacturing line, in order to be successful it is not only necessary to have sound business management, but to produce on a manufacturing basis, and in no line is it more important that the product be of good design, proper proportions throughout, and carefully made, than in manufacturing automobiles, which represent a complete power plant to be placed in the hands of the masses for use over roads and rights of way as we find them.

The future of the automobile can only be determined by

the results obtained from automobiles in service. First cost, maintenance and results considered, it must compare favorably with any other means of transportation, if it is to be accepted as a practical conveyance, and if not, it is a fad, and, like all fads, will run its course and die.

The satisfactory results obtained by users generally of many of the recognized makes to-day are due evidence of the fact that the industry has entirely outgrown the experimental period, and has already reached the stage where its product is sure to find a steady and increasing demand, and that the automobile can be considered on the basis of economy and reliability.

There is probably no industry in America which in so short a time has assumed the enormous proportions of the automobile business to-day. We have passed through the developing period, during which many cars marketed were probably pronounced unsatisfactory, and justly, if attending conditions were not considered. However, the progress made in this country as it relates to volume of business and great strides toward the perfecting of a new proposition, is nothing short of marvelous, and it is not only reassuring, but a credit to the broad gauged engineers affiliated with the industry, to note the almost general adoption of certain fundamental and underlying principles.

Most of the practices employed in the modern motor cars are old in mechanics, and we have merely put them to new uses. It is hoped that we have outlived the time when an unknown and untried article can be sold on appearance. Buyers are becoming more discriminating each year and buying more intelligently, not on looks, but on what is in the car and its ability to stand up and make good. And any maker should not hesitate to give evidence of this ability in one form or another of contest.

## THE RELATION OF RACING TO THE TOURING CAR

By J. D. MAXWELL.

AT the present time there is a strong feeling against racing automobiles on tracks, and perhaps this is justified in view of recent fatalities, but there is another side to the story. The big road races which are held abroad, and contests like the Vanderbilt Cup of last year, have always been great factors in developing the industry, and I do not believe it is putting it too strong to say that were it not for these contests the touring car would be far from its present state of perfection.

To the layman, racing and touring are totally divorced, yet as a matter of fact they are closely allied. The problems of building a successful racing car and a successful touring car are practically the same. There has never been a case where the designer who constructed a successful racing car has not been able to turn out a thoroughly reliable touring car.

Speed is a powerful factor for destruction, and how many cars do we see which give fairly good satisfaction under ordinary conditions and yet fall down when called upon for all that is in them. Every one who has championed racing has at some time or other come across a man "who never wanted to go more than twenty miles an hour—who does not want to race," etc. And while all that may be true, nevertheless the car built

by a manufacturer who has made good in the racing game is, I find, wanted even under the most adverse touring conditions.

It is interesting to look back for the past two or three years at some of the successful racing cars. They were almost without exception shaft driven. The effect of this on the trade is now evident by the fact that the majority of cars are adopting the shaft drive for 1908. Some of the problems which were worked out on several of the racing cars, as far back as 1904, are reflected in the latest 1908 models.

I do not wish to put myself on record as standing up for racing as it now exists, but I do believe that the best interests of the automobile business are served by the holding of some of the races of international importance.

The Long Island motor parkway, if ever completed, will solve this racing problem by making it possible to police the course, and thus make speeding as safe as it is possible to make it. Of course there are always dangers in traveling at such tremendous speeds, but I do not think the fatalities will be as great as those which we have every year from football, swimming, horseback riding, and kindred sports. There will be mishaps in all strenuous forms of competition, but these events will be held just the same.

Philadelphia, Oct. 21.—Borrowing a leaf from the books of the managers of the national shows, those at the head of the show of the Philadelphia Automobile Trade Association, at the First Regiment Armory, November 9-16, have decided to set apart Tuesday and Thursday nights of show week for "prospects," and admission fee will be raised to a dollar. "Society" is expected to respond in generous numbers.

The *Revue Commercial du Levant*, referring to the announcement that motor cars, which up to the present have been debarred from entering Turkey, are now authorized to do so with certain restrictions, points out that though good roads in the country are nonexistent the inhabitants will probably purchase cars which will have to be made solid on account of the inequalities of the road surface.

# THE A. C. A. AND THE AUTOMOBILE INDUSTRY

By S. M. BUTLER, SECRETARY A. C. A.

COLGATE HOYT,  
President A. C. A.

WHEN the Automobile Club of America was organized by a mere handful of men in 1889 a very small percentage of the American people had an idea of the enormous extent to which the automobile industry would grow. Even the few enthusiasts who did believe in the future of the self-propelled vehicle have not only seen their wildest fancies realized, but surpassed. But these few, in their wisdom, planned a campaign for the good of the many that was sufficient to provide for any emergency, and the club has prospered through steadfastness of purpose and meritorious action until it stands head and foremost in American automobiling with 1,500 members and the most complete club-

house and garage in the world. It is organization without a selfish purpose. "All for one and one for all" might well have been the motto of the Automobile Club of America.

Important has been the club's work in the fostering of the industry from a trade viewpoint by means of annual automobile shows, of which the exhibition in Grand Central Palace is the eighth yearly event. The initial show was planned when manufacturers and cars were few and the financial responsibility was correspondingly heavy. Individual members guaranteed the exhibit against loss and entered their private cars to fill up the more than ample amount of floor space.

From that year until the present the shows have been repeated under the club's management—not for gain, as profits are shared with the exhibitors—but merely to carry out the original plans of the organizers who saw so clearly into the future.

In a like manner healthy competition has always been fostered. The first parade occurred in January, 1899, with thirty-four horseless vehicles in line, including one bicycle and one delivery wagon. Turning west from Fifth avenue into 110th street, several vehicles fell out of line, being unable to negotiate the grade.

In the second run five of the steam machines ingloriously froze up en route.

In 1900 the first road race was held over a 50-mile course on Long Island, and was won by an electric vehicle, specially constructed, in 2 hours 3 minutes 30 seconds. The first long-distance club run was held in June of the same year from New York to Philadelphia with a stop at Princeton, N. J., for luncheon. Starting at 7:30 A.M., the winner arrived at the destination at 7:20 P.M.—the Bellevue-Stratford Hotel.

Nothing could better demonstrate the advance of the automobile than comparison with recent contests held by the Automobile Club of America. Sixty out of sixty-five starters finished in the two-gallon efficiency contest of

S. M. BUTLER,  
Secretary A. C. A.

1906, the Franklin winning with a record of 87 miles on two gallons of gasoline. Another great stride was apparent last June, when forty-one cars tied with perfect scores in the Sealed Bonnet contest. Only forty-eight cars started, and each of those finishing covered 600 miles in the four days without making an adjustment of any kind. It was a wonderful record.

The end is not in sight. Wherever the infant industry, now grown into a lusty child, will profit by advice or assistance, the Automobile Club of America will be found smoothing over the rough places until the automobile world for owners and manufacturers alike shall indeed be a Utopia.

Somebody must do the work, and the A. C. A. is not shirking the task.

GEN. GEORGE MOORE SMITH  
Chairman A. C. A. Show  
Committee.

## A PREDICTION AS TO THE FUTURE AUTOMOBILE

By GEORGE F. CHAMBERLIN, MEMBER A. C. A. SHOW COMMITTEE.

THE manufacturers have been so busy making cars for those willing to pay the prices and indulge in high speeds and luxurious fittings that they have quite overlooked the demand, now steadily increasing, for a reliable road vehicle at a price and cost of maintenance within reach of the farmer, the artisan, and others having moderate incomes.

GEORGE F. CHAMBERLIN,  
A. C. A. Show Committee.

The little runabouts, with their short, stubby base and small wheels, shod with expensive pneumatic tires, and their short-lived, high-speed engines, come far from meeting the real popular demand.

The "buggy type," now coming in ever-increasing numbers from the Middle West, is but an expression of the need that is felt by thousands; yet it but feebly represents an early step forward.

When the present mania for speed shall abate, when racing on

public highways is no longer tolerated, when sane owners shall refuse to burn up rubber to benefit the tire monopoly, and 25-cent gasoline to benefit the oil trust, then and not until then will be developed the type of vehicle meeting the urgent demands of that vast multitude which, satisfied with moderate speed, is anxiously looking for a car that shall be simple, safe, economical, and practical in all weather and on all roads open to traffic. Twenty years hence, when our roads shall have been generally improved, the present cars will be either objects of curiosity or consigned to the scrap heap.

What of the car of the future? Not the high-powered racing road locomotive, with its luxurious equipments, but one meeting the conditions as they shall be, with the road surfaces meeting the needs of a civilized community. Such a vehicle will surely involve more of a carriage and less of a locomotive.

Designers seem to have forgotten the freedom from conventional lines which the motor makes possible.

In the writer's opinion, the utility car of the future will have a most flexible frame, with long base, carried on wheels of exceedingly large diameter, shod with tires cushioned with either solid rubber or some cheaper substitute. The weight will be properly distributed, the motor to the rear and near the driving

wheels. It will have long double springs of great flexibility, which will take up most of the vibrations and road shocks now thrust upon the long-suffering tire.

The motive power will be an improved, simple and light form of three-cylinder engine of a two-cycle type, without valves or carbureters, having directly injected fuel, which will be kerosene or even a somewhat cheaper product of petroleum. It is probable denatured alcohol will also be largely used. The engine will be capable of developing at normal speeds one brake horsepower for each five pounds of weight or less and having a turn-

ing effort at slow speeds approximating steam engines. There will be no gears, and the motor will be silent and smokeless. The chassis will be arranged to take on by quick adjustment different styles of bodies suited for different work, the same standard chassis being used for business, agricultural or pleasure purposes, and last but not least, the price of such vehicles will be within reach of all.

These statements will be derided by those who fondly believe the present automobile standardized. They laugh best who laugh last.

## "A THING OF BEAUTY, UTILITY, AND A JOY FOREVER"

BY WINTHROP E. SCARRITT, A. C. A. SHOW COMMITTEE.

WINTHROP E. SCARRITT AS A 1901 AUTOIST.  
Member A. C. A. Show Committee.

THE most gratifying fact in connection with the automobile for 1908 is that it is approaching standardization and that few changes are made from the 1907 models. Refinements in details, a little improvement here and there, a weak part strengthened, surplus weight taken from other parts where experience

shows that it was not needed, and we have the 1908 motor car, the latest product of the master builder's skill, a thing of beauty, utility, and a joy forever.

My faith in the great future of the automobile increases daily. Pardon me if I repeat myself when I say that "The dreams of yesterday are the realities of to-day and the common places of to-morrow." How strikingly we have seen this great fact exemplified during the past few days! Five years ago the scientific world said that Marconi was a mad dreamer when he told it that he could telegraph without wires. That was a dream. This last week Marconi opened up commercial service between England and America and his dream has become a glorious reality. Some of us motor enthusiasts have been dreaming about the coming of the perfect automobile. One glad day this dream will become a splendid reality.

Then those who did the pioneering of automobiling and bore the brunt of educating the public can justly say "I told you so!"

## A. C. A. BUREAU OF TOURS HAS A NOVEL EXHIBIT

AN exhibit made by the Bureau of Tours of the Automobile Club of America at the show will probably be of particular interest not alone because of its decided novelty in America, but also on account of the lesson intended to convey in a very effective manner and at a very opportune time.

The rapid growth of the network of improved highways throughout the various States can never be thoroughly enjoyed by the automobile tourist unless hotel accommodations along these highways keep step with the improvements on the road. In order to convey an object lesson to serve as a practical education to the hotel and innkeepers along highways improved and to be

improved, the Bureau of Tours exhibits a model room to serve as a sample of what should be done to give the automobile tourist the comforts of a good, clean bed and a bath at the end of a day's dusty journey. The room is furnished in a sanitary manner with iron bedstead, good quality mattress, linen and bedding, iron washstand and enamel bath tub. The furniture is not expected to be elaborate, but must be sanitary and practically germ and worm proof. It is believed that this exhibit will arouse a great deal of interest among the users of the country districts, and it will benefit all automobile users alike throughout the country if the lesson strikes home.

## PREPARATIONS FOR CHICAGO'S NATIONAL SHOW

CHICAGO, Oct. 21.—Recent additions to the list of exhibitors at the First Annual Exhibition of Commercial Vehicles, to be held at the Seventh Regiment Armory, Chicago, at the same time as the annual display of pleasure cars, November 30-December 7, are the Advance Manufacturing Company, Chicago; Safir Automobile Company, Zurich, Switzerland; American Motor Truck Company, Lockport, N. Y.; Brush Runabout Company, Detroit; Streator Motor Car Company, Streator, Ill.; Worth Motor Car Company, Evansville, Ind. These bring the total up to twenty-six exhibitors of cars.

The Worth company has arranged to run a service of passenger cars between the Coliseum and Seventh Regiment Armory. The cars will run at intervals of about five minutes and there will be no charge for the service.

Included in the plan of decoration of the seventh annual

Chicago show will be 142 oil paintings, all of automobile subjects, covering 8,704 square feet of canvas. Of these pictures 112 will form a part of the background of the booths. They are being made by Maratta, one of the foremost of Chicago's artists. The remainder, covering a space of 8 by 668 feet, will encircle the building, around the gallery front, and are the work of the Daniels Scenic Studios.

A little additional space has been pressed into service in the Coliseum basement, making room for three of the automobile manufacturers who had been left out. The west end of the First Regiment Armory gallery will also be used, making room for about ten additional exhibits of accessories. There are fifteen makers of automobiles and forty makers of accessories on the waiting list. Some of them will probably be located in the commercial vehicle section.

# TREND OF MOTOR DESIGN REVEALED BY THE SHOW

By CHARLES B. HAYWARD.

THAT few departures from standard practice the passing of a little less than a twelvemonth has brought about are not easy to discern, for the time when the year of a motor's origin could be told at a glance is long since passed. Now it is quite evident that nothing short of a detailed analysis will suffice to reveal changes of a character so small as to appear of little or no importance, except to the experienced eye, and whether these changes really represent improvement or retrogression on the part of a designer is sometimes a question. Frequently the only thing that can be said of them is that they are changes, but as the purpose of the present article is merely to reflect current practice as revealed by the models put forth by the different makers for the coming year, and not to hold them up to criticism, it would be fruitless to pursue this side of the matter further, particularly in view of the impossibility of ever reconciling opinions to the

extent of favoring any one standard of design. Despite the almost universal demand for a multi-cylindere motor, which has taken on an entirely new phase in the past year or so, as evidenced by the general appearance of six-cylinder models, the humble single-cylindere car still holds its own and seems destined to do so for a long while to come. Though it has all but disappeared so far as the old-line makers are concerned, the Cadillac and Reo being practically the only representatives of this type marketed, the "one-lunger" has come in for a new lease of life at the hands of the maker of what is destined to prove a large factor in the American automobile industry in the future—the buggyabout. Even here there is a marked tendency toward the adoption of the horizontal opposed type of engine, but there are many equipped with single-cylindere engines, while the number turned out by the two makers in question reaches a very substantial figure every year. The latter has also received new impetus by the production of a vertical type in the shape of the Brush runabout. It was generally thought a year or two ago that the day of both the single and twin-cylinder motor had passed and that within a short time they would be practically extinct, but such a development appears distant now.

## Twin-cylinder Motor an Important Factor.

How far this has failed of realization is evident from the fact that the popularity of the two-cylinder motor has increased rather than diminished. Such makes as the Rambler, Reo, Maxwell, Moline and Jackson have been marketed during the past year in greater numbers than ever before, and a number of smaller firms have sprung up in the same time to manufacture this type of car, from all of which it appears quite conclusively that the two-cylinder car has an extremely strong hold on the public demand. Whether it will continue to keep it, once the four-cylinder type of car of equal capacity and attainments is brought down to the price level of the twin-cylinder, is another matter, as, popular opinion to the contrary notwithstanding, the prospective purchaser considers initial cost more than that of maintenance.

It can hardly be said that there has been any great amount of improvement in the design of either the single or twin-cylinder motor in the past few years, and certainly there is not a great deal to chronicle where these types are concerned in the new models offered at the Palace show. An exception is to be found in the case of the Brush vertical single-cylinder and the Rambler horizontal-opposed motor, in which the valves have been placed at

the side of the cylinders instead of on top, now being actuated by direct thrust from a single camshaft placed vertically and driven by a worm gear, this permitting the use of a release cam for starting in place of the usual release cocks.

Minor changes have been made by some of the other makers, but they are not of such a nature as may be taken to indicate any changed tendency of design. The selling price at which cars equipped with engines of this type are usually listed does not permit of extensive experimenting on the part of the makers, which probably accounts for the fact that the majority are quite content to let well enough alone, although it must be added that the well-enough of the past year where the horizontal-opposed motor is concerned has been a far more satisfactory state than that of but a year or two previous, so that great improvement has been brought about with but little visible change.

One of the most noticeable things in connection with the single and two-cylinder cars is the fact that for the first time the East is treated to a comprehensive showing of that product truly indigenous to the Middle West—the buggyabout. Probably the most prominent in the single-cylinder class is one that represents a radical departure in many things—the Brush runabout. In the buggyabout class there are the Holzman, the Reliable-Dayton, the Schacht, the Hatfield, Kiblinger, Success, and others.

## To Be a Six-cylinder Year.

To jump to the opposite extreme, it is evident at a glance that 1908 is to be a six-cylinder year. The automobile-buying public has expressed its approval of the type in question in no uncertain manner and the majority of makers have not been slow to note the trend of the demand and to make preparations to take advantage of it. Nominally, then, there are not a few six-cylinder stock models; actually, the greater number of makers who have decided to list such a car in order to be able to cater to buyers of either class without having to sit on the fence, ever ready to drop on either side in accordance with the opinions of the prospective buyer, will only build such cars to order. Of course, all cars above a certain price are really only built to order, but in the case of the six-cylinder models, many of the makers have not quite made up their minds to plunge and will keep more closely within the demand than in the case of their four-cylinder models.

But the number of makers who have decided to list a model of this type leaves no possible room for doubt that the six-cylinder note will be a predominant one; at least it is in the show. In a few instances, such as the Chadwick, the makers have dropped all other models and concentrated their attention on the production of a car of this type. Some of the other makers whose stands will be centers of attraction on this account are the Acme, Ford, Frontenac, Glide, Marion, Mora, Gearless, Stoddard-Dayton, Premier, Welch, Pullman, American Mors, Colt, Frayer-Miller, Napier, Speedwell, and National. In this list will be noted several who will be entering upon their second year in the advocacy of the six-cylinder, such as the Ford, National, Frayer-Miller, and Napier, while considerable novelty is to be found in the Gearless six, not alone on account of its special form of transmission, but the fact that it is equipped with a two-cycle engine and is the first of its type to be presented.

Where motor design is concerned, the six-cylinder cars do not, as a rule, differ radically from those of their predecessors of four cylinders, but in one or two instances, such as that of the Chadwick, where the makers are pinning their faith entirely on the six-cylinder, their cars have been the subject of special attention and embody numerous features of merit. In the majority of instances, however, the six-cylinder merely represents the addition of two cylinders, other changes being confined to minor details or modifications necessary to suit the difference in the

power-plant. Wheelbases are a little longer and the cars, as a rule, are of the seven-seated type. In other words, the six-cylinder, as represented by the numerous models unveiled at the show, is a large car. This characterization may not be entirely just, as some of the makers have shaded matters to a point where their sixes are neither as large as the prevailing type, nor, for that matter, as large as many of the standard four-cylinder types.

#### Details of Motor Design and Construction.

It is a toss-up whether there has been any appreciable variation during the past year in that essential which really represents the foundation of the motor—the cylinder castings. Those who have hitherto advocated separately cast cylinders are still of the same opinion, and the same is true of their confrères who hold that the twin casting is superior, while there bids fair to be a new element introduced in that the practice current abroad of casting all four cylinders in one piece seems about to be taken up here. The foregoing would also appear to approximately sum up the situation where the matter of valve-placing is concerned; there are just about as many advocates of outboard, oppositely disposed ports, necessitating the use of two camshafts in the direct-thrust method, as there were a year ago, and there does not seem to have been either any additions to or defections from the ranks of those who favor concentrating the valves on one side.

The practice of placing the valves in the head has received at least one notable recruit in the shape of the new Ellsworth car, but so far as numbers are concerned, this is offset by the change on the part of the designers of the Rambler, who have come back to the direct-thrust method after two years in the other camp. But, then, the Ellsworth is a car of many special features, the valves being placed in the usual outboard ports, but actuated from a single superimposed camshaft through bronze rocker arms supported on annular ball-bearings. It also represents an exception to the usual practice of cylinder casting in that the jackets are left open at either side of the cylinder and covered by a light steel plate held on by screws. Apart from this particular instance, water-jacket design has undergone practically no change, the usual method of casting the jacket integral has been followed in the majority of instances, though there is a tendency to provide more liberal sized openings than previously. The monotony is, of course, varied by such special systems as that of the Pullman, now in use for the past two years or more.

The practice of making the camshafts and cams integral has come to be followed in a greater number of instances and the placing of these essentials in the crankcase in a position to receive the benefit of splash lubrication is almost universal. Crankcase design has undergone but slight change where old line cars are concerned, though some of the new models exhibit a commendable tendency to provide a maximum of accessibility by using extra large hand plates. An exception to the former statement is to be found in the case of the new Rambler motor, which has a crankcase of the undivided type, the shaft with the center and end bearings assembled being put in through the end openings. Crankshaft design naturally depends upon the remaining features of the motor, and as there have been so few changes in the latter, this also applies to this essential. Materials have been improved and there is a decided tendency to regard anti-friction bearings for this purpose in a far more favorable light than formerly.

#### Improvement in Ignition and Carbureter Systems.

While there has been little or no radical change where either of these essentials is concerned, there is a marked tendency to follow certain definite lines in both cases. In that of the former, it is quite evident that the magneto is coming in for more and more favorable attention, even at the hands of builders of cars the selling price of which does not permit of equipping them with a magneto, except as an extra. In other respects, ignition systems reveal little or no change unless it be in the detailed refinement of coils, timers and similar apparatus, upon the proper design and working of which the ignition of a car depends to such a very great extent. With the exception of a few special-

ized systems, ignition practice as a whole, may be said to have settled down to a well-defined standard, or set of standards, which only vary with the price of the car. Where the latter is high, duplicate ignition with magneto and accumulators, frequently with two entirely independent systems, is the rule, though in many cases the same set of plugs and the magneto distributor are utilized for both sides.

In the case of the carbureter, there appears to be a decided tendency on the part of the builder of cars to shift the responsibility for this essential to the specialist. The latter has devoted a great deal of pains and study to the development of the carbureter, and the automobile designer has found the latter to have resulted so much more satisfactorily than his own efforts along the same line, that he appears to have been only too content to be able to specify an article of known merit for this rôle. It is accordingly not surprising to note the great number of instances in which cars are equipped with such standard makes of carbureters as the Schebler, Holley, Kingston, Universal, Buffalo, Heitger, and others, even though the remainder of the motor has been the subject of exclusive design and production.

Concerning the carbureter itself, there has been a radical departure in design. This is to be found in the case of the Holley, which is now constructed on the well-known Venturi tube principle, thus eliminating the float chamber with its attendant complications and marking a long step in advance toward the goal of simplicity, which is the object most sought for in this piece of apparatus, long considered as something that could not be otherwise than complicated. To sum up the situation in this field, the average maker has found that the carbureter is an object of special manufacture and has come to the conclusion to drop all further efforts toward evolving special designs of his own.

#### Status of the Air-cooled Car and the Two-cycle.

That there have been no unusual developments where either of these is concerned need occasion no surprise, nor be considered as something to their detriment. The past year has been marked by the defection from the ranks of the advocates of air-cooling, by one or two concerns, but for reasons which were set forth in these columns and editorially commented on at the time. Air-cooling having demonstrated, not alone its feasibility, but its advantages beyond the shadow of a doubt, is hardly to be considered as less well-established where the American industry is concerned, merely because there are not so many makers who are manufacturing cars of this type. The same thing is applicable to the status of the two-cycle motor as well. This has received more or less impetus during the past year by the adoption of this type of motor in some of the small, light cars, otherwise known as buggaboots, which appear in numbers for the first time at this week's show. But there is a genuine surprise awaiting the average show-goer in the shape of the Gearless six-cylinder car having a two-cycle engine. The same car is also made with a four-cylinder engine of the same type, so that it is evident this type of motor has gained a valuable addition to the number of advocates who are building and marketing cars thus equipped. Then there is the expansion of the Atlas line from the single representative in the shape of a small two-cylinder runabout of a year ago to a well-developed line, all of which are equipped with the special type of two-cycle engine used by the Atlas concern on both its commercial as well as its pleasure vehicles, so that it would seem that the passing of 1908 would mark the advent of a great many more two-cycle cars on the road than has ever been the case in previous years.

Progress has not been marked, however, and the advance accomplished is probably not apparent to the casual observer, who takes small account of anything so inconspicuous. The apathy on the part of the industry where both these special types are concerned is readily accounted for by the fact that the four-cycle water-cooled type has had the great advantage of priority and in consequence the greater development that the study of such a large number of makers and users have been able to bring to bear

The Berliet is not exhibited at the Grand Central Palace, but is shown at the manufacturers' special salesrooms at the Waldorf-Astoria.

1908

**ACME SEXTUPLET TOURING CAR, 6 CYLINDERS, 45-H.P., PRICE \$4,500.**  
The Acme Motor Car Co., Reading, Pa.

**AUSTIN RUNABOUT, MODEL XC-R, COMBINATION BODY, 90-H.P., PRICE \$6,000.**  
Austin Automobile Co., Grand Rapids, Mich.

1908

**GREAT CHADWICK TOURABOUT, 6 CYLINDERS, 50-H.P., PRICE \$5,500.**  
Chadwick Engineering Works, Philadelphia, Pa.

**GEARLESS GREYHOUND ROADSTER, 6 CYLINDERS, 75-H.P., PRICE \$4,000.**  
Gearless Transmission Co., Rochester, N. Y.

AMERICAN MORS CHASSIS, 6 CYLINDERS, 40-H.P., PRICE, TOURING CAR, \$4,250.  
St. Louis Car Company, St. Louis.

1908

GEARLESS TOURING CAR, 4 CYLINDERS, 60-H.P., PRICE \$3,500.  
Gearless Transmission Co., Rochester, N. Y.

**GARFORD TOURING CAR, MODEL B, 4 CYLINDERS, 40-H.P., PRICE \$4,000.**  
Garford Manufacturing Co., Elyria, O.

1908

**GREAT SMITH TOURING CAR, 4 CYLINDERS, PRICE \$2,500.**  
Smith Auto Co., Topeka, Kan.

**RAINIER TOURING CAR, MODEL D, 4 CYLINDERS, 45-50-H.P., PRICE \$4,500.**  
Rainier Motor Car Co., Saginaw, Mich.

1908

**DE LUXE TOURING CAR, 4 CYLINDERS, 40-H.P., PRICE \$5,000.**  
De Luxe Motor Car Co., Detroit, Mich.

CONTINENTAL TOURING CAR, MODEL C, 4 CYLINDERS, 35-H.P., PRICE \$3,000.  
Continental Auto Manufacturing Co., New Haven, Conn.

1908

GLIDE TOURING CAR, 4 CYLINDERS, 45-H.P., PRICE \$3,000.  
The Bartholomew Company, Peoria, Ill.

**PENNSYLVANIA TOURING CAR, TYPE C, 4 CYLINDERS, 40-H.P., PRICE \$3,000.**  
Pennsylvania Auto Motor Co., Bryn Mawr, Pa.

1908

**PULLMAN TOURING CAR, MODEL J, 4 CYLINDERS, 40-H.P., PRICE \$3,750.**  
York Motor Car Co., York, Pa.

**MOLINE TOURING CAR, MODEL A, 4 CYLINDERS, 35-H.P., PRICE \$2,500.**  
Moline Automobile Co., East Moline, Ill.

1908

**FRONTENAC LIMOUSINE, 4 CYLINDERS, 40-H.P., PRICE \$5,000.**  
Abendroth & Root Manufacturing Co., Newburgh, N. Y.

AMERICAN MORS TOURING CAR, 4 CYLINDERS, 14-18-H.P., PRICE \$3,000.  
St. Louis Car Co., St. Louis, Mo.

1908

WAYNE TOURING CAR, 4 CYLINDERS, 30-35-H.P., PRICE \$2,500.  
Wayne Automobile Co., Detroit, Mich.

MARMON, MODEL H, 4 CYLINDERS, 35-40-H.P., AIR-COOLED, PRICE \$3,500.  
Nurdyke & Marmon Co., Indianapolis, Ind.

1908

MARMON, MODEL H, 4 CYLINDERS, 40-45-H.P., WATER-COOLED, PRICE \$3,500  
Nurdyke & Marmon Co., Indianapolis, Ind.

**NATIONAL TOURING CAR, MODEL K, 4 CYLINDERS, PRICE \$3,500.**  
National Motor Vehicle Corporation, Indianapolis, Ind.

1908

**JACKSON TOURING CAR, MODEL E, 4 CYLINDERS, 35-H.P., PRICE \$2,000.**  
Jackson Automobile Co., Jackson, Mich.

**DORRIS TOURING CAR, MODEL C, 4 CYLINDERS, 30-H.P., PRICE \$2,500.**  
Dorris Motor Car Co., St. Louis, Mo.

1908

**LANE STEAMER TOURING CAR, MODEL 8-7, 30-H.P., PRICE \$3,500.**  
Lane Motor Vehicle Co., Poughkeepsie, N. Y.

GAETH TOURING CAR, TYPE XV, 4 CYLINDERS, 35-40-H.P., PRICE \$3,500.  
Gaeth Automobile Co., Cleveland, O.

1908

CARTERCAR, MODEL A, 2 CYLINDERS, 22-H.P., PRICE \$1,350.  
Motorcar Company, Detroit, Mich.

MITCHELL, MODEL I, 4 CYLINDERS, 35-H.P., PRICE \$2,000.  
Mitchell Motor Car Co., Racine, Wis.

1908

MAXWELL TOURING CAR, MODEL M, 4 CYLINDERS, 40-H.P., PRICE \$3,000.  
Maxwell-Briscoe Motor Co., Tarrytown, N. Y.

REO TOURING CAR, MODEL A, 2 CYLINDERS, 18-H.P., PRICE \$1,250.  
R. M. Owen & Co., 1759 Broadway, New York.

1908

LAMBERT TOURING CAR, 4 CYLINDERS, 35-40-H.P., PRICE \$2,500.  
Buckeye Manufacturing Co., Anderson, Ind.

CLEVELAND TOURING CAR, 4 CYLINDERS, 40-45-H.P., PRICE \$3,500.  
Cleveland Motor Car Co., 1659 Broadway, New York.

1908

HOLSMAN SURREY, 2 CYLINDERS, 12-H.P., PRICE \$800.  
Holsman Automobile Co., Chicago.

1908

**SPEEDWELL ROADSTER, 6 CYLINDERS, 60-H.P., PRICE \$4,250.**  
Speedwell Motor Car Co., Dayton, O.

1908

**PULLMAN RUNABOUT, MODEL 4-40, 4 CYLINDERS, 40-H.P., PRICE \$3,000.**  
York Motor Car Co., York, Pa.

**MOON ROADSTER, 4 CYLINDERS, 30-H.P., 3 PASSENGERS, PRICE \$3,250.**  
Moon Motor Car Co., St. Louis, Mo.

WAYNE RUNABOUT, 4 CYLINDERS, 30-35-H.P., PRICE \$2,500.  
Wayne Automobile Co., Detroit, Mich.

1908

MARION FLYER RUNABOUT, 4 CYLINDERS, 24-H.P., PRICE \$2,250.  
Marion Motor Car Co., Indianapolis, Ind.

AMERICAN ROADSTER, 4 CYLINDERS, 40-H.P., PRICE \$3,250.  
American Motor Car Co., Indianapolis, Ind.

**DRAGON ROADSTER, 4 CYLINDERS, 35-H.P., PRICE \$1,850.**  
 Dragon Automobile Co., Philadelphia.

1908

**COLT 6-CYLINDER RUNABOUT, 40-H.P., PRICE \$1,500.**  
 Colt Runabout Co., 1876 Broadway, New York.

**RAMBLER RUNABOUT, 4-CYLINDER, 40-H.P., PRICE \$2,250.**  
 Thomas B. Jeffery Co., Kenosha, Wis.  
 This car is not exhibited at the Palace Show, but will be shown in Chicago.

MAXWELL RUNABOUT, 2 CYLINDERS, 12-14-H.P., PRICE \$825.  
Maxwell-Briscoe Motor Co., Tarrytown, N. Y.

LAMBERT RUNABOUT, 2 CYLINDERS, 18-H.P., PRICE \$800.  
Buckeye Manufacturing Co., Anderson, Ind.

1908

REO ROADSTER, 2 CYLINDERS, 18-20-H.P., PRICE \$1,000.  
R. M. Owen & Co., 1759 Broadway, New York.

MITCHELL TOURABOUT, 4 CYLINDERS, 20-H.P., PRICE \$1,250.  
Mitchell Motor Car Co., Racine, Wis.

OVERLAND RUNABOUT, 4 CYLINDERS, 18-22-H.P., PRICE \$1,260.  
Overland Automobile Co., Indianapolis, Ind.

FRAYER-MILLER COMBINATION RUNABOUT, 24-H.P., PRICE \$2,500.  
Oscar Lear Auto Co., Springfield, O.

NATIONAL MODEL N ROADSTER, 4 CYLINDERS, 2 PASSENGERS,  
PRICE \$3,700.  
National Motor Vehicle Co., Indianapolis, Ind.

CAMERON MODEL 8 RUNABOUT, 4 CYLINDERS, 16-H.P., PRICE \$1,060.  
Cameron Car Co., Brockton, Mass.

1908

SCHACHT AUTO RUNABOUT, 12-H.P., PRICE \$680.  
Schacht Manufacturing Co., Cincinnati, O.

LANE STEAMER RUNABOUT, 30-H.P., PRICE \$3,000.  
Lane Motor Vehicle Co., Poughkeepsie, N. Y.

HATFIELD BUGGYABOUT MODEL D-E, 2 CYLINDERS, 12-H.P.,  
PRICE \$800.  
Hatfield Motor Vehicle Co., Miamisburg, O.

RELIABLE-DAYTON SURREY, 2 CYLINDERS, 15-H.P., PRICE \$925.  
Reliable Dayton Motor Car Co., Chicago.

1908

LOGAN THREE-TON TRUCK, MODEL S, WITH OPEN BODY, 4 CYLINDERS, 40-H.P.  
Logan Construction Co., Chillicothe, O.

1908

RAPID 12-PASSENGER CAR, MODEL E-132, 24-H.P., PRICE \$2,000.  
Rapid Motor Vehicle Co., Pontiac, Mich.

FRAYER-MILLER TRUCK, AIR-COOLED, 4 CYLINDERS, 24-H.P., PRICE \$3,000.  
Oscar Lear Automobile Co., Columbus, O.

1908

MITCHELL OPEN DELIVERY VEHICLE, 4 CYLINDERS, 20-H.P., PRICE \$2,000.  
Mitchell Motor Car Co., Racine, Wis.

**RELIANCE OPEN DELIVERY VEHICLE, TWO-CYCLE, 4 CYLINDERS, 60-H.P., PRICE \$4,400.**  
 Reliance Motor Car Co., Detroit, Mich.

1908

**MANHATTAN 22-PASSENGER 'BUS, 4 CYLINDERS, 50-H.P., PRICE \$6,500.**  
 Mack Brothers Motor Car Co., Allentown, Pa.

TREND OF MOTOR DESIGN.

(Continued from page 550.)

upon it. As a result, it has become the fashion, with the important difference, however, that it is one difficult to change. Just so long as it is easier to sell cars of this type so much easier just that long will makers work along the line of least resistance.

Both Extremes Reached in Powers.

Where motor powers are concerned, it may be said that these are higher and lower than ever before, a statement that may appear enigmatic at first sight. In other words, makers have reached forth to both extremes. Some have realized that the day of the overpowered car is on the wane and are taking advantage of this knowledge to be first to place on the market a more rational type of vehicle, as well as one that will appeal to a greater class of buyers. Others have continued along the same course that they have been following for the past two or three years, that of making their motors constantly larger, and these examples find their extreme in the numerous six-cylinder models to be unveiled. The latter being in the majority of cases merely a 50 per cent. increase in motor size, without other alterations, and not a special design, it follows that these cars represent a corresponding increase in power.

But it is also true that the four-cylinder types have continued to increase in size so that dimensions of 5-inch bore and stroke, or, in excess of that figure, are far more common than those of 4 inches, though nominally powers are no greater in many instances than they were two or three years ago. Cylinder dimensions and compression have been increased more or less during that time, the first-named to the greatest extent of course, but ratings have not gone up correspondingly. The "30" of a few years ago was frequently not even a good "25," but the "30" of to-day is more often a "50" or better. Increasing other factors has made possible a reduction in speed, so that 800 to 1,000 r. p. m. is now an almost universal standard instead of the 1,000 to 1,200 r. p. m. of a few years ago, though the present-day motors are capable of greater flexibility and will consequently speed up to as high a maximum as their predecessors and with better results.

Current Tendencies in Transmission Practice.

Experience having thus far proven the sliding type of change-speed gear to be able to hold its own despite its disadvantages and the claims of superiority of other systems, its use may be said to be practically universal. There have been further improvements in materials conducing to durability, while the adoption of the selective type of operation has to a very great extent

reduced the chance of damage in use. Other factors that have played a very important part in this field have been the anti-friction bearing and the use of some form of simple interlocking device, preventing shifting before the disengagement of the clutch, as well as obviating the possibility of simultaneously engaging two different speeds or reversing unintentionally.

At present its strongest competitor would appear to be the friction type, which has several representatives among the cars shown at the Palace. One of the chief advocates of this system is the Lambert, and its success on the various types of cars turned out by the makers of this line during several years past would appear to substantiate some of the claims made for it. The Cartercar is another upholder of the friction type of change-speed gear, while quite a proportion of the makers of the popular buggyabout also favor it for reasons that are obvious. It represents the maximum of simplicity as well as being fool-proof and enduring to the greatest degree, so that its development on the light car would appear to be a foregone conclusion. There has been at least one strikingly unusual development where the friction type of change-speed gear is concerned, and that is to be found in the advent of the Gearless four and six-cylinder cars which are equipped with an essential of this type, but which operates on the planetary method of speed-changing, in which respect it bears no resemblance to any other form of friction apparatus as used on the car. In fact, it is little more or less than a friction type of planetary transmission, the idea being extremely cleverly worked out with the minimum of parts, all of which are of substantial size and durable nature.

The question of chain or shaft drive seems to have been finally settled in favor of the latter by tacit consent. Except in the lightest types using a single chain drive, the propeller shaft has been developed to a degree of simplicity and reliability where its use is practically universal on cars of light, medium and heavy types, only the smallest and largest being exceptions to the rule.

Development of the Commercial Vehicle.

Although it was with no unusual heralding or advance blowing of horns that it was brought about, a review of the list of exhibitors suffices to show that there are more commercial vehicles at the present show—and more of the heavy type than have ever been brought together before. For instance, there are the Atlas and Reliance using two-cycle motors, the Rapid, Logan, Manhattan, Mitchell and Frayer-Miller, the first two showing heavy trucks, the Rapid and Manhattan sight-seeing cars, while the others build trucks of varying capacities. The Brush Runabout Company and the Motor Car Company, Inc., list a delivery wagon.

# SOME DETAILS OF THE PALACE SHOW CARS

## GASOLINE PLEASURE VEHICLES.

ACME: Acme Motor Car Company, Reading, Pa....	Main Floor 39

## ELECTRIC COMMERCIAL VEHICLES.

LANSDEN: Lansden Co., Newark, N. J.....	1st Gallery 212
---	-----------------

**ACME.**—There will be two Acme cars for 1908, the Acme Motor Car Company, Reading, Pa., having decided to enter the ranks of the six-cylinder advocates. A car of this type, officially known as Type XX, and familiarly as the "Acme Sextuplet," will constitute their new offering. The cylinders measure 4 1-2 by 5 inches and are cast separately, the motor being rated at 45 horsepower at 1,000 r. p. m. Double ignition, with both systems entirely independent of one another, is employed, the Eisemann high-tension magneto having been adopted to fill one of these rôles, while the standard form of accumulator and coil system is used for the other. A four-speed selective change-speed gear is used, running on Hess-Bright ball bearings. The front axle is of Cramp's manganese bronze of I-beam section, and the rear is of nickel-steel of square section.

The other Acme is known as Type XVIII, and is a four-cylinder, 30-horsepower, seven-passenger car, embodying the majority of the features which distinguish the six-cylinder model such as the double ignition with Eisemann magneto, liberal use of ball bearings, and similar commendable features.

**Allen-Kingston.**—This is a new car claiming Kingston, N. Y., as its home and which made its debut with considerable credit to itself at some of the 24-hour races during the present season. It is made by the Allen-Kingston Motor Car Co., and several types will be marketed, though the same standard chassis will be employed in every case. Model C will be a 40-45-horsepower touring car, with a seating capacity of seven. Its power plant consists of a four-cylinder, vertical, water-cooled engine, closely conforming to well-established engineering standards throughout, as is also true of the remainder of the car, no radical deviations from current practice or ideas of a revolutionary nature being embodied in its design or construction. Ignition is by high-tension magneto with an independent single vibrating coil and set of accumulators acting through a distributor as a standby, or to facilitate starting. The clutch is of three-disk type, with cork inserts in the faces of the friction surfaces. A four-speed selec-

tive type of change-speed gear comprises the next essential of the transmission, while final drive is by shaft. The wheelbase of the touring car is 126 inches and its weight 3,300 pounds.

**American.**—This car, made by the American Motor Car Company, Indianapolis, Ind., is distinguished, in the special roadster type, by a unique form of suspension which permits of bringing the center of gravity of the car very low, without at the same time impairing its clearance. The latter is something of great importance in touring American roads, and though this car appears to be extremely low owing to its unusual suspension, this essential has been amply provided for. It has been designed solely as a roadster capable of high speed and long endurance, and its seating capacity is limited to two persons, the seats being placed quite well to the rear. Ignition is by high-tension magneto and a cone clutch in connection with a progressive type of sliding gear and shaft drive to a floating rear axle completes the transmission. The wheelbase is 106 inches and its weight is 2,200 pounds, which is unusually low for its power. A 40-horsepower standard touring car completes the line, and with the exception of the special suspension and other features peculiar to the runabout, it is of the same design throughout.

**American Mors.**—One of the surprises that the St. Louis Car Company, St. Louis, builders of the Mors car under license from the French factory, reveals is a six-cylinder, shaft-driven car which embodies numerous features of merit from an engineering point of view, as well as a number of points of considerable interest to the experienced autoist. This is a seven-passenger car with a 127-inch wheelbase and tips the scales at 3,600 pounds. Three other models will be shown, all of the four-cylinder type, the one to first catch the eye doubtless being the specially designed 14-horsepower town car, which is destined to prove a large factor in the near future. It has a landaulet body seating five, and represents an interesting example of what can be done in the shape of a car built for this service, as nothing that could possibly conduce to its efficiency or the comfort of the passengers has been omitted. The remaining members of the line are a standard 40-horsepower touring car and a 24-horsepower car of the same type, both being seven-passenger cars of the side-chain driven type, as is also the case with the town car, the six-cylinder being the only shaft-driven car listed.

**Atlas.**—The Atlas Motor Car Company, Springfield, Mass., formerly the Knox Motor Truck Company, is the only concern exhibiting at the show which makes a specialty of turning out both pleasure and commercial vehicles of the two-cycle type. The former was confined to a two-cylinder runabout during the present year, but for the coming season there will be listed a three-cylinder, double folding-seat runabout holding two or four passengers, and in a four-cylinder model in the shape of a five-passenger touring car, the powers being 22, 36, and 46-horsepower respectively. The two new models make their debut at the show and their specifications are of interest. The cylinder dimensions are 4 1-2 by 4 1-2 inches, thermo-syphon cooling is used and high-tension ignition from batteries. The clutch is of the conical type, with a three-speed selective change-speed gear and shaft drive in each case, Hess-Bright ball bearings being used in the gear-set and Timken roller bearings in the wheels. The latter are 34 by 3 1-2 in the case of the smaller car and 34 by 4 inches on the larger. Three quarter elliptic springs are used on the former and semi-elliptic on the latter.

**Austin.**—As in former years, the Austin as revealed at the show will be distinguished by the high power of the various models staged. The Austin Automobile Company, Grand Rapids, Mich., will this year turn out a new six-cylinder roadster with combination body, permitting its use either as a runabout or as a touring car. They also show a four-cylinder 60-horsepower limousine with detachable top, and a 90-horsepower, six-cylinder touring car. These cars are distinguished by numerous exclusive features of design and construction that have been evolved by their builders, and, having proved unusually successful during the several years that this line has been on the market, have been per-

petuated from season to season in improved and modified form, so that they may well be said to now represent an Austin standard of construction which has been reached by successive stages of improvement as experience has dictated the necessity.

**Brush Runabout.**—While much has been said and written about this novel little car since the date of its introduction by the Brush Runabout Company, Detroit, Mich., this will be the first occasion of its public exhibition, and it is naturally expected to form a center of attraction, owing to the numerous features of design and construction which characterize it, and which are so different from current standards. Five models are listed, three of them for pleasure use and two for commercial service. Model 1A is a six-horsepower, single-cylinder runabout, with piano box body, seating two people, and Model 1B is the same chassis with a few extras. Model 2A is a two-cylinder touring car rated at 12 horsepower and seating four people, while Model 2B is a delivery wagon on the same chassis, and Model 1C is a package delivery on the single-cylinder chassis. High-tension ignition, with accumulators, cone clutch, planetary change-speed gear, and side-chain drive are characteristics common to all the models. The wheelbase of the single-cylinder chassis is 74 inches and the twin-cylinder 88 inches.

**Cameron.**—These cars, made by the Cameron Car Company, Brockton, Mass., are distinguished by the use of an air-cooled motor and a special form of rear-axle transmission. Three types are made, known as Models 6, 8, and 9, the first being a two-seated, non-convertible runabout; the second, a larger car of the runabout type with rumble seat, and the third a four-seated surrey on the same chassis as Model 8. The motor is a four-cylinder, air-cooled type, on which the use of two exhaust pipes is taken advantage of for cooling purposes, in addition to the specially cast radiating ribs. The valves are placed directly opposite one another in the side of the cylinder head, and are mechanically operated by rocker arms. The valves are in cages and are readily removable for inspection and repairs. Another notable feature about the Cameron car is the special ball-bearing rear-axle transmission, which is incased in the same housing as the bevel-gear drive and differential as a unit, and is extremely compact and simple.

**Cartercar.**—"No gears to strip—no clutch to slip," is the slogan of the Motorcar Company, Detroit, Mich., builders of the Cartercar, which is distinguished by the use of a friction type of change-speed gear and transmission combined, and to which this firm has devoted its energies for some time past. Both pleasure cars and commercial vehicles are built, the former in runabout, roadster, and touring types, and the latter principally in the shape of delivery wagons, the chassis being of the same design and construction throughout in both cases. The power plant consists of a twin-cylinder, horizontal-opposed type of motor, placed transversely across the forward part of the frame, and directly behind it, making its location about the center of the chassis, is placed the friction disk, directly attached to an extension of the motor crankshaft. Back of this is the countershaft, carrying the friction wheel and sprocket, from which the single-chain drive to the rear axle is taken.

**Carter Two-engine Car.**—As their title indicates, the chief feature of these cars is the employment of two motors, which are placed side by side in the same position as the single engine is usually located. They are made with either air or water-cooled motors of equal power, which are so arranged that either may be used separately or both together. This gives the car the rather anomalous rating of 24-60-horsepower. It will be the only eight-cylinder car staged at the show. A touring car type is listed, having either a five or seven-passenger body. The transmission is by cone clutch through a sliding gear of the selective type, with final drive by shaft. The wheelbase is 114 inches and the weight 3,500 pounds, all on. A smaller car with a five-passenger body is also listed. It has a 103-inch wheelbase and weighs 2,400 pounds. These cars are manufactured by the Carter Motor Car Corporation, Washington, D. C., and Detroit, Mich.

**Chadwick.**—The Chadwick Engineering Works, Philadelphia, Pa., is one of the few firms who will devote its entire attention to the production of a six-cylinder car during the season of 1908. It will probably be the largest car of its kind at the show, the six-cylinder motor measuring 5 by 6 inches and being rated at 75 horsepower, while it is geared in the ratio of 1.9 to 1, so that its 36-inch driving wheels will make one revolution for less than two turns of the motor crankshaft. Every feature of its design and construction reflects the result of long study and experience in automobile building, and it has many to attract the eye and hold the attention of the auto designer as well as the autoist. As its motor turns over at the rate of 1,100 r. p. m. when developing its normal rating, it will have a speed of a little better than a mile a minute. Doubtless the first thing to strike the eye is the dual unit, copper water jacket made to surround each pair of cylinders, which has long been a feature of the Chadwick cars, while another to hold the attention is the ingenious chaincase, though to tell the truth there are so many special features of interest about the car that it would be useless to attempt to enumerate them here.

**Cleveland.**—In keeping with the policy adopted by so many makers of high-grade cars, the manufacturers of the Cleveland, the Cleveland Motor Car Company, New York, will concentrate their efforts on one chassis for the season of 1908. Its power plant consists of a four-cylinder, vertical, 5 by 5-inch motor, with the cylinders cast in pairs. Ignition is of the high-tension type with a Bosch magneto, an auxiliary system using an independent coil and set of accumulators also being fitted. Lubrication is taken care of by a positive-feed mechanical oiler, self-contained in the motor, while a water-jacketed, 1 1-2-inch Schebler carbureter provides the fuel supply. A Mayo radiator of special shape and a gear-driven pump comprise the cooling system. The transmission consists of a multiple disk clutch and a four-speed selective type of gear-set, final drive being by shaft. In both the latter essentials F. & S. annular ball bearings are employed. The running gear consists of 36 by 4-inch front and 4 1-2-inch rear on the touring car, and 36 by 3 1-2 and 4 on the roadster, the wheelbases being 122 and 110 inches, respectively.

**Colt Runabout.**—The exhibit of the Colt Runabout Company, Yonkers, N. Y., is of interest in that this concern confines its attention solely to the production of a runabout type of car, whereas in the majority of instances the runabouts listed by other makers are merely bodies of that type mounted on standard touring car chassis, with a few modifications to suit the purpose of the two-seated roadster. The Colt is unusual in other respects as well. It forms one of the numerous contingent of six-cylinder advocates, but is of conservative size, its motor only being rated at 40 horsepower, which, however, is unusually high when it is considered that the complete car, with all on, only tips the scales at 1,800 pounds, making its proportion of power to weight one of the most noticeable at the show. A Bosch high-tension magneto supplies the ignition, while the remaining features of the motor are of exclusive design. The transmission consists of a conical type of clutch, together with a selective form of change-speed gear and shaft drive. The wheelbase is 105 inches and the body fitted is a special racing type.

**Continental.**—This is a new car from the college town of New Haven, Conn., and though it has gone through its baptism of fire in the chief events of the past season, this will be its first show. It is the work of C. S. Johnston, who lays no claim to originality or to the use of radically different ideas, but takes pride in the fact that it is patterned throughout after the most approved standards of automobile engineering construction. It is being turned out in a model factory established by the Continental Automobile Manufacturing Company, New Haven, Conn., and will be shown in several models. The Model C is a standard, four-cylinder touring car with a 120-inch wheelbase, while Model B is the same chassis with motor further back and equipped with a body of the semi-racing type having three seats. Model D is a four-cylinder, 50-horsepower car along the same standard lines

and with Model E, a 40-horsepower, six-cylinder car, completes the line. A magneto of the company's own special design and make will be fitted as an extra. All the motors are equipped with a special compression relief, making them very easy to start.

**Crawford.**—Every phase of the demand for high-grade cars at a medium price has been catered to by the Crawford Automobile Company, Hagerstown, Md., in making its plans for the season of 1908, and as a result its line will consist of five models, ranging from 35 to 50 horsepower. Model D is a three-passenger runabout rated at 35 horsepower and having a 112-inch wheelbase, while Model E is the same chassis fitted with a touring body, the wheelbase being 106 inches. Model C is a 40-horsepower touring car seating five, while Model F is a 50-horsepower machine which is listed in both touring and limousine types, and has a capacity of seven passengers in either form. The specifications of all these models are practically uniform where the chassis design and construction is concerned. All are equipped with magneto ignition, multiple disk clutch, selective type of change-speed gear and shaft drive, the wheelbases ranging from 106 inches, in the case of the 35-horsepower touring car, to 118 inches in the Model F 50-horsepower car, while the weights range from 2,300 to 3,400 pounds.

**De Luxe.**—As has been the case during the past season, the makers of the De Luxe, the De Luxe Motor Car Company, Detroit, Mich., will confine their attention to the production of a high-powered touring car in one model. The power plant of this car is of a special design, having oppositely disposed valves, mechanically operated through walking-beams actuated by a single camshaft. The motor dimensions are 5-inch bore by 5 1-4-inch stroke, and it is designed to produce its rated power output at a moderate normal speed. Dual ignition, comprising two entirely independent systems, using an Eisemann high-tension magneto on one side and a set of coils and accumulators on the other, has been made a feature. The carbureter is an exclusive design. A conical metal-to-metal clutch with cork inserts is fitted with four-speed selective change-speed gear and shaft drive, in combination with a solid one-piece I-beam rear axle. Chrome-nickel steel is employed for making all forgings, and annular ball bearings are used wherever available, no less than 33 ball bearings being employed on the car. The wheelbase is 121 inches and 36 by 4 and 5-inch tires, front and rear, are used.

**Dorris.**—The exhibit of the Dorris Motor Car Company, of St. Louis, Mo., is one that causes the technical expert as well as the autoist interested in fine design and construction to linger somewhat longer than is usually accorded the average exhibit, for the many novel features of the car's power plant and chassis cannot fail to attract favorable attention. The motor is of the overhead valve type, the valves being actuated by rocker arms and rods of special design, and the whole arrangement being unusually well worked out. The same compactness of design that characterizes the motor and that is at once evident in the lack of superfluous details or amount of metal, is also apparent in every feature of the chassis. A four-cylinder motor is employed, the power being transmitted through a clutch of the multiple disk type and of extremely compact and simple construction, a gear-set of the sliding type with selective operation and a shaft drive completing the remaining essentials of the transmission. The chassis is fitted with either a runabout or touring body, seating three or five.

**Dragon.**—High proportion of power to weight, which is achieved only by the use of high-grade materials and skilled design and construction, are characteristics of the Dragon car, of which the Dragon Automobile Company, Philadelphia, will list a touring car and a special roadster. This is evident from the fact that the 24-26-horsepower touring car with a 104-inch wheelbase tips the scales at only 1,050 pounds, while the 35-horsepower runabout with its 96-inch wheelbase weighs only 1,600 pounds. A wood body is fitted to the former and special metal body with a capacity of two persons is fitted to the latter. In other respects the chassis specifications of both cars are very similar through-

out. The motor accessories are of a standard high-grade type, and the power plant as a whole is extremely simple, compact, and accessible. The transmission consists of a conical, leather-faced type of clutch, in connection with a sliding pinion type of change-speed gear using progressive operation, final drive being by shaft.

**Eagle.**—This car is of interest in that its power plant reveals the further possibilities of the internal combustion motor that have yet to be developed. Its power plant consists of a three-cylinder compound gasoline motor, two of which are high pressure and the third low pressure, this last being placed between the other two. Each of the high-pressure cylinders exhausts into the intermediate or low-pressure, the dimensions of which are about twice those of the high-pressure cylinders, instead of being permitted to escape into a muffler or the air, as is the common practice. In this large cylinder the pressure of the exhaust gases, which in the average motor are allowed to escape while still holding considerable energy, is further expanded until a point but little above that of atmospheric pressure is reached, so that when the burnt charge is finally exhausted from the low-pressure cylinder it is no longer necessary to employ a muffler. It is manufactured by the Eagle Motor Car Company, Middletown, Conn.

**Ellsworth.**—This is an entirely new comer which will make its debut in chassis form at the Palace show. It has been designed throughout by Thomas J. Fay, who has incorporated in it many features of merit, learned as the result of experience in building and repairing the best-known cars of both American and foreign makes, during the past several years. It is being built by J. M. Ellsworth, 520-522 West Twenty-second street, New York City, and has been christened the "chrome-nickel-steel car," as that material enters almost entirely into its make-up. It might have been named ball-bearing with equal justice, as anti-friction bearings of this type have been employed wherever possible. But it is not so much these features as those of the design of the various parts and the fine points involved in their method of construction that will be of chief interest to the engineering fraternity, as this is something of which Mr. Fay has made a special study, carefully avoiding those errors of machine-shop practice common in the building of other machinery, and which have been found so dangerous when transplanted to automobile making.

**Ford.**—In accordance with the Ford policy of keeping a good thing dark until it is ready not alone to be announced to all the world, but to be marketed as called for, the Ford exhibit does not display any of the novelties that the makers of this popular car have up their sleeves for the coming year. Their showing is confined to chassis of the present year's models, with some improvements in body design that will be current on this make next season. The most prominent of these is a taxicab on the runabout chassis. But it is known at the present writing that all the Ford 1907 models will be continued, and an addition of three or four new members made to the family. Also that the plans of this house looking to production on a vast scale will be further carried into practice during the coming year, as materials are being contracted for and arrangements made to produce no less than 25,000 Fords of all types in 1908. Just what the characteristics of these promised new models will be is something that has been kept as dark as a Japanese plan of campaign, and it will continue to be kept under cover until the makers see fit to announce it publicly. This concerns chassis details alone and will not be forthcoming until later.

**Frayer-Miller.**—This car will be shown in three distinct types of chassis, all equipped with motors of the special air-cooled type that has been evolved and developed by the Oscar Lear Automobile Company, Springfield, O. The smallest will be of 24 horsepower and will be made in three types, the first being known as the Frayer-Miller "Philadelphia" car, although the signification of this title appears somewhat ambiguous. It is a two-passenger runabout. As a touring car it will have a seating capacity of five, and instead of the cone clutch used on the runabout, it is equipped with an internal-expanding type. Between

these two is a runabout combination car having a seating capacity of two, three, or four passengers, at will. All three models have a 100-inch wheelbase and shaft drive, but the first is fitted with a three-speed change-speed gear, while the other two are provided with four forward speeds. The other members of the line are the six-cylinder, 36-horsepower touring car and the 56-horsepower, four-cylinder touring car, this last-named machine being the only one to be fitted with magneto ignition.

**Frontenac.**—The builders of the Frontenac, the Abendroth & Root Manufacturing Company, Newburgh, N. Y., while numbered among those who will exhibit a center of attraction for the auto-buying public in the shape of a six-cylinder model, will devote the greater part of their attention to their four-cylinder model, which is the result of three years' study and experiment, having first made its appearance last year and but a limited number being built. The designer is finally satisfied that there is absolutely nothing left to be desired where either the design or construction of the car is concerned, and they will be turned out in numbers during the coming season. The motor is of the standard, four-cycle, four-cylinder type, measuring 4.3-4 inches bore by 5 inches stroke, and is rated at 40-45 horsepower. The clutch is of the multiple disk type, self-contained in the flywheel and consisting of alternate plates of malleable iron and bronze, the former of which are provided with cork inserts. A three-speed gear-set is fitted, operated on the selective plan, and final drive is by shaft. Tire equipment is 4-inch front and 4 1-2-inch rear, on 34-inch wheels, the wheelbase being 124 inches.

**Gaeth.**—The Gaeth Automobile Company, Cleveland, O., is one of the comparatively small number of firms that are showing both pleasure and commercial vehicles in their exhibit. The former consists of four-cylinder, 35-40-horsepower standard type of touring car, with a seven-passenger tulip type of body. This car is distinguished by several features of design and construction to be found only in scattering instances in American practice, such as the use of the low-tension make-and-break type of ignition, constricting band clutch, and the like. The change-speed gear is of the sliding-gear type, with progressive method of shifting. Final drive is by shaft, and the car's wheelbase is 112 inches. This car is officially known as Type XV., while the commercial vehicle is known as Type K. It is equipped with a single-cylinder, 12-15-horsepower motor, placed horizontally under the body, and represents a form of construction which has been developed by this firm for several years past. It is fitted with a planetary type of change-speed gear and double side-chain drive.

**Garford.**—Probably the most numerous line of cars to be staged at the show is that of the Garford Manufacturing Company, Elyria, O., whose product is marketed through the Garford Motor Car Company of New York, the latter's headquarters being at 1540-1542 Broadway, New York City. While these cars are new to the public under this name, their makers are doubtless the largest manufacturers of parts in the country, and as such have been supplying many firms who did assembling for several years past. The line comprises a 30-horsepower touring car and roadster, 40-horsepower ditto, a 30-horsepower limousine and landaulet, and a 40-horsepower limousine, known as Model A or B, according to the power of the motor. Both chassis are characterized by those features of design and construction with which the product of this concern has long been identified, chief among which are the low-tension type of ignition, cone clutch and shaft drive, a progressive type of change-speed gear being employed on the 30-horsepower car and selective type on the larger car.

**Gearless.**—It is safe to say that there will be few exhibits in the entire show that will be of such absorbing interest to the engineer and autoist alike as that of the Gearless Transmission Company, Rochester, N. Y. This firm is not alone placing on the market a six-cylinder, two-cycle motor—the first of its kind ever placed on an automobile—but as its name indicates, has devised a form of change-speed gear that is minus the chief distinguishing characteristic of this part of the car—that is, the gears or pinions. It is also marketing a four-cylinder, two-cycle car, and as such,

represents a notable addition to the list of manufacturers who are devoting their attention to this type of motor. The change-speed gear, which is naturally of greatest interest, is essentially of the planetary type of operation, but depends upon the friction of the engaging surfaces rather than teeth, to transmit the power. The six-cylinder motor is rated at 75 horsepower and the four-cylinder at 60 horsepower, both being shown in touring and runabout types, the latter being known as the Gearless Greyhound.

**Glide.**—Early in the present season the Bartholomew Company, Peoria, Ill., decided to cast its lot with the advocates of the six-cylinder type, and its efforts in this direction will be revealed for the first time at the show. The newcomer is known as Model H, and is a 60-horsepower car of seven-passenger capacity. Its weight is 4,000 pounds and it has a 132-inch wheelbase, its remaining features being similar to those which have long been adhered to by the builders of the Glide in the design and construction of their cars. The other members of the line are the Model G and the Glide 45, the first-named being a 40-horsepower, five-passenger car, and the second being a 50-horsepower machine of the same capacity, although this may be easily increased to seven in either case. The ignition on the Model G is by means of coils and accumulators, dual ignition, using a high-tension magneto for general service, being installed on the two larger models. A selective type of change-speed gear is employed on all three and all are shaft-driven, the two smaller cars having a 120-inch wheelbase.

**Great Smith.**—These cars claim Topeka, Kan., as their home and the Smith Automobile Company, of that city, as their makers, though the latter's product is now distributed entirely through the Smith Motor Car Company, also of Topeka, Kan. A touring car and roadster are listed, the chassis being equipped with a 4 1-2 by 5-inch, four-cylinder, water-cooled, vertical motor, nominally rated at 24 horsepower, though actually developing almost twice that, or 45 horsepower. The design throughout is original in many ways, though conforming closely to the highest standard practice, and a number of the accessories of the power plant are of exclusive manufacture, such as the Smith carbureter and the Smith vertical tubular radiator. The clutch is the Stafford patent, multiple disk, the gear-set being of the three-speed sliding type, operating with a single lever, which automatically disengages the clutch, shifts the gear and re-engages the clutch without recourse to the pedal. The wheelbase is 110 inches and 36 by 4-inch tires are used. Either as a touring car or roadster, the list price is \$2,650.

**Grout.**—For the coming season Grout Brothers Automobile Company, Orange, Mass., will devote their entire attention to the production of a 35-horsepower, four-cylinder chassis which will be listed both as a five-passenger touring car and as a three-seated roadster. The chassis specifications are, with few exceptions in the shape of detailed improvements here and there, practically the same as those of this year's car. The motor-cylinders are cast in pairs, high-tension ignition, using a standard four-unit coil and set of accumulators, automatic lubrication and carburetion, gear-driven circulating pump, and other features of motor design and construction have all been continued with little alteration. The clutch is of the conical type, while the gear-set is sliding with progressive changing, final drive being by double side-chains. The weight of the touring car is 2,600 pounds all on, and that of the roadster 2,350 pounds, both cars listing uniformly at \$2,500 with the usual equipment.

**Hatfield Buggyabout.**—"An automobile without an expense account" is the characterization given the Hatfield buggyabout by its makers, the Hatfield Motor Vehicle Company, Miamisburg, O., and a review of the simplicity of its specifications would seem to bear this out fully. To quote further, it is "gearless and clutchless." Its power plant consists of a two-cylinder, opposed, air-cooled motor, which is mounted well to the rear, thus concentrating the weight over the drivers. It is placed transversely with the flywheel facing forward, the latter being utilized as a member of the friction transmission, the remaining essentials of

this consisting of a substantial countershaft, on the central portion of which there is a movable friction wheel, arranged to be pressed into contact with the friction facing on the flywheel, while on its ends it carries sprockets for the double-chain drive to the rear wheels. These sprockets are of the differentially-acting reverse ratchet type; they are extremely simple and positively are exclusive on this car. Another special feature is a patented shock absorber, which is part of the regular equipment of the car.

**Holsman.**—As the predecessor of all the buggyabouts, the Holsman can look down upon the many that have since sprung into existence, as it has now been manufactured continuously over a period of seven years, and there are hundreds of this make of cars on the road. The makers—the Holsman Automobile Company, Chicago—show two types, namely, a runabout and a surrey, both of which, however, are built on the same chassis. The motor is of the twin-cylinder, horizontal, air-cooled type, placed beneath the body, and is somewhat anomalously rated as having an output of 124.5 horsepower, by the makers. Jump-spark ignition is employed, using dry cells, and both the lubrication and fuel supply are automatic. The clutch is of a special type devised by this house, as is also true of the transmission, which is by means of steel cables running from sprockets on a countershaft to the rear wheels, the tension on these cables being adjustable by means of a hand side lever, serving to move the countershaft backward and forward, the reverse also being obtained in this manner. The wheelbase in both models is 75 inches and the weight of the runabout is 940 pounds and that of the surrey 1,050 pounds. The running gear is of the high-wheeled type, using solid rubber tires.

**Imperial.**—Under this title a new car which hails from western Pennsylvania makes its debut at the present show. It is the product of the Imperial Motor Car Company, Williamsport, Pa., and though 1908 marks the second year of its career, the coming season will be the first in which it will be turned out in numbers. It has a 4 1-2 by 5 1-4-inch four-cylinder motor, conservatively rated at 35 horsepower, the design and construction of which closely follow the highest standard practice in every respect. The clutch is of the metal-to-metal, floating ring type, equipped with cork inserts, the second member of the transmission consisting of a sliding type of change-speed gear providing three forward speeds and operating on the selective plan. An I-beam, forged front axle is employed, with a full floating type rear. Dual ignition is employed, using an Eisemann high-tension magneto on the running side, while lubrication is of the circulating type, using a reservoir in the crankcase. The wheelbase is 108 inches and the tire equipment 36 by 3 1-2 all round.

**Jackson.**—As during past seasons, the Jackson line for 1908 will comprise a number of types, ranging from the low-powered, two-cylinder car which made such a name for itself in this year's contests, up to a 35-horsepower touring car. They are listed as Jackson Models C, D, and E, and the makers, the Jackson Automobile Company, Jackson, Mich., have made plans to greatly increase their output for the coming year. Model C is a 20-24-horsepower, two-cylinder car, with a seating capacity of five. It has a multiple disk clutch, planetary type of change-speed gear, and single-chain drive. The wheelbase is 96 inches and it tips the scales at 2,000 pounds. Model D is of the same power and the same type of motor, but is fitted with a sliding type of change-speed gear, using the selective method of operation, and has a final shaft-drive. Its wheelbase is 106 inches and it weighs 200 pounds more. Model E is a standard type of four-cylinder car rated at 35 horsepower, and is made either with a five-passenger touring body or a runabout body seating three or four. The wheelbase is 111 inches and the weight 2,450 and 2,400 pounds.

**Kiblinger.**—This is without doubt the lowest-priced car exhibited in the show, as the models listed by the W. H. Kiblinger Company, Auburn, Ind., range from \$250 to \$500. They are of the popular buggyabout type, and no less than six models are listed. The motor is of the horizontal, double-opposed type, and is conservatively rated at 8-10 horsepower. It runs quietly and has an abundance of power, giving the car a speed range of from

4 to 25 miles an hour, with good hill-climbing capacity, while some idea of its economy in operation may be gained from the fact that the makers claim it will cover 35 miles on a gallon of gasoline. The smaller types, such as Models A and B, are fitted with single-cylinder motors of 4 and 6 horsepower. Ignition is of the high-tension type, using accumulators as the source of current. A disk clutch and planetary form of change-speed gear are employed, with final drive by side chains. The wheelbase is 65 inches, and the weights range from 600 pounds upward, according to the model.

**Kisselkar.**—This is a car from the West which makes its first appearance in the East at this show. It is made in Hartford, Wis., by the Kissel Motor Car Company, and was only brought out during the past season. Three models are listed, all of them being placed on a 35-40-horsepower, four-cylinder chassis. The mainstay of the line, of course, is the touring car, which is fitted with five to seven-passenger body. Ignition is of the high-tension type, using both accumulators and dry cells, while the motor accessories throughout are of the types favored by standard practice, and are of high-grade construction, although the cars are built to list at a low price, considering their size and equipment. A conical type of clutch is fitted in connection with a sliding type of change-speed gear, operating on the selective plan, final drive being by shaft and bevel gear to a rear live axle. The roadster is fitted with a specially designed three-seated body, and its specifications are much the same as those of the touring car, which is also true of the limousine. The wheelbase in each case is 107 inches, and the weights range from 2,100 to 2,800 pounds. Both roadster and touring car list at \$2,000, and the latter at \$2,200 with full equipment, including top and glass front.

**Klink.**—Dansville, N. Y., is the home of the new Klink car, and it is the boast of its makers that there is no more strenuous testing ground to be found anywhere in this country than is afforded by the hilly country of up-State New York that is to be found around Dansville, and on which all the Klink cars undergo their final try-out. The motor is of the standard four-cylinder, vertical type rated at 30 horsepower, and the touring car is fitted with a five-passenger body of the King of the Belgians type. Ignition is of the high-tension type, using the standard form of unit dash coils with accumulators as the source of current supply. A conical type of clutch is fitted, together with a selective form of sliding gear, providing three forward speeds and reverse, final drive being by bevel gear and shaft. The wheelbase is 110 inches and the weight of the touring car 2,100 pounds. The runabout has a seating capacity of four passengers, as the rumble accommodates two. Other details are the same, including the wheelbase, while the weight is 1,900 pounds.

**Lambert.**—As exponents of the friction type of power transmission, the makers of the Lambert cars, the Buckeye Manufacturing Company, Anderson, Ind., have developed this system with unusual success, and their consistent adherence to it ever since they entered the automobile industry, is ample evidence of their faith in its superiority as well as what they have been able to accomplish with it, as both their heavy commercial vehicles as well as their pleasure cars are fitted in this manner. Four types of pleasure cars are listed for the coming season and all will be seen at the show. They are, in the order of their importance, the Lambert "18," a two-cylinder, 18-horsepower car of the single-chain driven type, seating three people; the Lambert S, also a two-cylinder car of 24 horsepower, with double-chain drive, seating five people, and the Lambert Models R and M, both of which are 35-40 horsepower, seven and five-passenger touring cars of the standard type. Model R is side-chain driven and Model M has a shaft drive, the wheelbases being 106 and 105 inches, respectively.

**Logan.**—Interest in the Logan line will be divided between pleasure and commercial vehicles, as the Logan Construction Company, Chillicothe, O., has long devoted a considerable part of its attention to the latter, with no little success. The Logan Blue-Streak semi-racer met with an unusually favorable reception during the past year, and on more than one occasion was given an

opportunity to show what it could do in the way of speed and endurance over the worse than indifferent roads of the Middle West. In fact, so successful has this model proved itself that the makers have added a somewhat similar car of 20-24 horsepower, designed especially for the use of professional men, physicians, and the like. Its power plant consists of a four-cylinder, air-cooled motor, sliding gear transmission and shaft drive, while its features in the main are those of the Blue-Streak. All on, it tips the scales at only 1,587 pounds and is intended to be an easy car on tires. One of the chief models of the Logan truck line for 1908 will be a three-ton vehicle designed in accordance with the standards evolved by this firm in its several years' experience in the commercial line.

**Marion.**—In the Marion, made by the Marion Motor Car Company, Indianapolis, Ind., is to be found another of the numerous advocates of the six-cylinder type. Its representative in this field will be known as the Marion "Six-Thirty," which is expressive of its type of engine as well as its power. It is shown with a two-seated roadster body and has dual ignition, using a high-tension magneto on the running side with accumulators and coils in reserve. The clutch is of the multiple disk type and the change-speed gear sliding, final drive being by bevel gear and shaft to a live rear axle. The wheelbase is 102 inches and the weight, all on, 1,900 pounds. The other car, known as Marion Model 8, is fitted with a roadster body, but is capable of carrying two, three, or four passengers. It is equipped with a standard, vertical, four-cylinder, water-cooled motor, conservatively rated at 24-horsepower, and, with the exception of not being fitted with a magneto, its specifications are very similar to those of the six-cylinder roadster, the wheelbase being the same, with the weight 50 pounds less.

**Marmon.**—The features characteristic and prominent heretofore in Marmon construction, viz.: the 90-degree air-cooled motor, Marmon system of automatic force-feed lubrication through the hollow crankshaft, and the double three-point suspension in which the power-plant is on one frame and the body on another, each having three-point suspension, have all been retained in the line put out by the Nordyke & Marmon Company, Indianapolis, Ind., for the season of 1908. There are two touring cars known as Models G and H, the former being a five-passenger car of 104-inch wheelbase and 34 by 4-1-2-inch tires on quick detachable rims, some of its other features being a multiple-disk clutch, selective type of sliding-gear transmission, shaft drive and roller-bearing steering column. Model H is also a five-passenger car, but has sufficient room in the tonneau for two extra seats. Its wheelbase is 114 inches and it has the same tire equipment. A radical change has been made in the motor by casting the heads separately, this construction having many advantages. This firm will also list a water-cooled car.

**Maxwell.**—Quite in keeping with the ambitious plans the Maxwell-Briscoe Motor Company, Tarrytown, N. Y., has been making during the past season for its 1908 product, it now uncovers at the show one of the biggest things to be found there in the shape of a four-cylinder car of standard design and construction. This is a new 26-horsepower four-cylinder model, built along the same lines as the car that distinguished itself so ably in the A. A. A. tour last summer. It is listed at \$1,750 and has the same type of unit power-plant and transmission that have always been identified with the Maxwell design. The gear-set is of the sliding type, providing three forward speeds, and operates on the progressive style, an efficient interlocking device preventing any damage to the gears. Final drive is by propeller shaft, the Maxwell type of rear-axle driving unit being employed with its tubular steel housing. The other members of the line are the Model LC, 1-14-horsepower runabout, the 16-20-horsepower five-passenger touring car with double-opposed motor, and the Model M, 40-horsepower four-cylinder touring car, which is the highest-powered Maxwell representative.

**Mitchell.**—There will be no less than five Mitchells for 1908, including the Mitchell truck, which has proved so success-

ful during the past two years. In short, the Mitchell Motor Car Company, Racine, Wis., will market a 20-horsepower four-cylinder tourabout, known as Model G, with a three-seated body; a 20-horsepower two-seated runabout, known as Model H, and a 35-horsepower four-cylinder touring car with a five-seated body, known as Model I. This last car will also be made as a limousine. The wheelbase of the two smaller cars is 92 inches and that of the larger ones 112 inches, while the weights are 1,650, 2,500, and 3,000 pounds, respectively. The chassis specifications of all four are similar, high-tension ignition being used, cone clutch, sliding gear with progressive operation, and shaft drive, while the details of the commercial car are the same as those of the 20-horsepower chassis, the body being of either the open or enclosed type and fitted to order. The pleasure cars are equipped with a bevel gear drive, while the commercial car is fitted with a special form of worm-drive evolved by this firm.

**Moline.**—As has been its policy in the past, the Moline Automobile Company, East Moline, Ill., will continue to cater to a wide range of auto buyers by showing three different models. The smallest of these is the two-cylinder 18-horsepower Model H, Moline, which has proved so successful that scarcely any change has been found necessary to make it fulfill the rôle for which its manufacturers designed it—that of supplying the needs of the autoist who wishes a light, medium-powered car of low first cost and reasonable upkeep expense. The other Moline cars are the Model A and Model S. The former is equipped with a 4 1-2 by 5-inch bore and stroke, four-cylinder motor rated at 35-horsepower, while the latter—the smaller of the two—has a 3 7-8 by 4 1-2-inch motor conservatively rated at 24 horsepower. This car has a 100-inch wheelbase and is equipped with 32 by 3 1-2-inch tires, while the larger car has a 110-inch wheelbase and its rolling gear is shod with 34 by 4-inch tires all round. A three-speed sliding gear is employed on both, together with shaft drive.

**Moon.**—A new addition to the Moon line this year consists of a seven-passenger car having a 121-inch wheelbase, and equipped with 36 by 3 1-2 and 36 by 4 1-2 tires front and rear, the quick detachable type being specified on this as well as on the other model, which is a five-passenger car having 110-inch wheelbase and listed either with touring or roadster body. The motor is of the same design as that used in 1907, having the valves in the head, the chief difference in the power-plant consisting of the adoption of the Eisemann high-tension magneto. Both chassis will be equipped with selective type of sliding change speed gear, giving four speeds and reverse, the smaller cars being fitted with 34 by 3 1-2-inch tires front and 34 by 4 1-2-inch rear. The same multiple disk clutch and the same honeycomb type of cooler which proved so efficient on the present year's model have both been retained without change. All the timing gears on the motor as well as the pinions driving the magneto and circulating pump have been enclosed in an oil-tight and dust-proof housing.

**Mora.**—As the shining light of the Mora line, made by the Mora Motor Car Company, Newark, N. Y., there is a brand-new six-cylinder model which is unveiled for the benefit of the show visitors, as its specifications had not been made public heretofore. The cylinders are of the same size and type as the fours, but the crankshaft is mounted on annular ball bearings, this also being true of the camshaft. The selective type of change speed gear is also similarly equipped, while the front axle is of the I-beam type and the rear axle of the full floating type. The four-cylinder cars are of the same general type and construction as during the present season, with the addition of a number of detailed improvements. The motor is still built with marine type bearings, but malleable iron boxes and nickel habbitt bearings have been substituted for the former bronze boxes. The timer is now placed vertically and located forward instead of at the side, while the carbureter has been shifted over to the left-hand side. The lines of the body of the Mora-Tourer have been slightly changed, but the general dimensions are the same.

**Napier.**—Although the English-built Napier is now confined to a six-cylinder model, its American counterpart is exhibited in a four and a six. The former is a small car of 20-horsepower and is fitted as a runabout, with a seating capacity of two, and is a type of car that the Napier Motor Car Company of America, Boston, Mass., has always devoted its attention to. It has cone type of clutch, with selective change speed gear and shaft drive, a 90-inch wheelbase, and weighs 1,800 pounds. The six-cylinder car is rated as 60-75-horsepower and is fitted with a seven-passenger touring body. It has high-tension magneto ignition and in other respects it is similar in design and construction, not only to the smaller car but to the well-defined characteristics of Napier construction that have long been distinguishing features of this make of car. The six-cylinder model has a 126-inch wheelbase and weighs 3,400 pounds. The finish is also that made familiar by these cars in the past.

**National.**—Having already served in its initiation in the building of six-cylinder models, the National Motor Vehicle Company, Indianapolis, Ind., will go in stronger for this type in 1908 than previously, and accordingly shows six-cylinder cars in two sizes. The smaller car of this type is known as Model R and is equipped with 4 1-2 by 4 3-4-inch engine with twin-cast cylinders which is a model of compactness, as it has been the designer's object to keep the wheelbase down as much as possible to make the car handle easier, this dimension being 116 inches. Four large Hess-Bright bearings are used on the crankshafts, with similar bearings on the camshafts, extra large nickel-steel valves being employed to reduce the lift to a minimum, so that the motor as a whole has been made as quiet-running as possible. The large six-cylinder car has a 5 by 5-inch engine, and a four-cylinder type is also put out with the same size engine, while a smaller four has a 4 1-2 by 4 3-4 motor, making four distinctive models in all which will be listed by the National factory for 1908. Probably the most striking change where the casual observer is concerned will be the option offered by the makers of either a rectangular radiator, or the circular type that has been a distinguishing characteristic of the National cars ever since the latter have been on the market.

**Overland.**—This is a new car which is shown in the East for the first time at the Palace Show, and is made by the Overland Automobile Company, Indianapolis, Ind. The firm will devote its attention chiefly to the production of runabouts which will be fitted with an 18-22-horsepower four-cylinder motor, an expanding ring clutch, planetary type of change speed gear and a bevel gear and shaft drive to the live rear axle. The wheelbase is 96 inches and the weight, all on, 1,590 pounds, giving the car an excellent proportion of power to weight. High-tension ignition is employed, and the remaining motor accessories are of the best standard type favored by up-to-date practice. A two-passenger special runabout type of body is fitted. The car lists at \$1,250 in complete running order and with the usual equipment of lamps, horn, tools, etc.

**Pennsylvania.**—The Pennsylvania "50," officially known as the Pennsylvania Type C, will be the 1908 model of this firm of builders, the Pennsylvania Motor Car Company, Bryn Mawr, Pa. It is a car of numerous distinctive features, the motor being of the overhead valve type, but with the valves oppositely disposed and independently operated by two separate camshafts. The valves with their housings, springs, and other small parts are made in the shape of an easily removable unit and their withdrawal from the cylinder head exposes practically the entire interior of the combustion, thus permitting access to the latter for cleaning without going through the tedious process of dismantling the entire motor. The crankshaft is also worthy of note. It is a hollow drop-forging supported on liberal-sized die-cast bearings and it is employed to facilitate lubrication, which is taken care of by a Kinwood pressure feed oiler. The clutch is of the conical type of improved design, while the gear-set is located on the rear axle, this essential and the bevel drive and differential all being incorporated in a unit.

**Pullman.**—The makers of the York Pullman cars, more commonly known by the latter half of their designation, are numbered among those who believe in catering to as wide a range of buyers and taste as possible, and, in consequence, their line for 1908 will comprise no less than four models. As a matter of fact, the York Motor Car Company, York, Pa., is planning to market no less than five models during 1908, of which three will be distinctive types. These will be the Models I and J touring cars, a low-powered touring car, the details of which are not yet ready to make public, and the models 4-40 and 6-30 runabouts, the last-named being a six-cylinder car. The standard followed throughout is embodied in the construction of the Model I, five-passenger, 40-horsepower touring car, with its motor having independently cast cylinders, special type of water-jacketing and cylinder coupling and simplified water-circulation piping. The valves are oppositely disposed and mechanically operated, while the crankshaft is offset from the cylinder centers. Ignition is through a single coil, and combined timer and distributor and lubrication are taken care of by a six-feed oiler.

**Premier.**—Another addition to the list of converts to the six-cylinder idea is the Premier Manufacturing Company, Indianapolis, Ind., and, in consequence, their line for 1908 numbers a car of this type. This company's experiments with six-cylinder motors dates back to two years ago, their first trials being made with a 4 1-4 by 4 1-2-inch motor, cylinders paired, and with a triple Y manifold for the intake. The results obtained were very satisfactory, and the design as modified by experience and study in the interim is now making its debut at the show. The chief departure from the standards formerly adhered to by this firm, is the adoption of the Bosch low-tension magneto, a second system of the high-tension type using a single coil with distributor and accumulators as current supply also being installed. The low-tension igniters are driven from the intake camshaft by spiral gears and are advanced by moving the camshaft longitudinally. A departure is also to be noted in the use of a pressed steel oil pan under the crankcase in place of aluminum, as well as in the use of compression grease cups on the spring shackles, beside which the car has numerous other features of merit.

**Rainier.**—Except for the increase in the power which has been made to comply with the current demand, the single model which will be turned out by the Rainier Motor Car Company, at its new factory in Saginaw, Mich., will be practically identical with its predecessors, and the cars of this model will be marketed under the company's established policy of guaranteeing them free of repairs for a year. The car will be known as Model D and will be a 45-50 horsepower machine weighing 2800 pounds. Simplicity and accessibility throughout have been the aims of designer James G. Heaslett, who has been responsible for the Rainier for the past three years and who is now chief engineer at the new plant. The magneto can be removed and replaced in a few moments without disturbing the ignition timing, the clutch can be removed by taking out six cap screws and removing the pin from the universal, and the same is true of practically every part of the car. Drop forgings are used exclusively and all nickel-steel parts are specially heat-treated.

**Reliable Dayton.**—This is one of the popular type of buggyabouts for which the Middle West is becoming justly famous and which are exhibited for the first time in the East in any numbers. These cars are made by the Reliable Dayton Motor Car Company, 15-21 N. May street, Chicago, and are shown in two types, known as Models E and F, the former being a buggy and the latter a surrey. The power-plant consists of a horizontal, double-opposed type of motor, water-cooled, and with the jackets cast integral. The engine is placed under a sloping bonnet forward, with the radiator dropped from the forward cross-piece of the frame, a gear-driven pump being employed for circulation. The change-speed gear is of the sliding type, providing two speeds forward and reverse, final drive being by side chain of the Diamond roller pattern with Timken roller-bearing axles. The wheels are 40 inches front and 44 inches rear, shod with

11-4-inch Firestone side-wire solid tires. The wheelbase is 84 inches and the steering by T-bar side lever, the steering column also carrying the control and gear-shifting lever.

**Reo.**—Model C, 18-20 horsepower roadster, forms the star attraction of the Reo line for 1908, and on it the makers, the Reo Motor Car Company, Lansing, Mich., have spared no pains to make it represent the last word in the design and construction of a two-cylinder car to sell at a popular price. It is on practically the same chassis as the touring car of the same power which has been the leader of the Reo line since the latter has been on the market, and is fitted with an attractive type of runabout body with third seat on the tool box in the rear. In spite of this, it is listed at \$1,000 and is one of the biggest things in the show. Numerous improvements have been made on the other models, the wheels of the Model A, five-passenger touring car having been increased from 30 to 32 inches, 3 1-2-inch Michelin tires on Goodyear detachable rims being specified as the regular equipment. The braking system also has been improved by the addition of an emergency rear wheel brake with an improved braking lever, fitted in an outside quadrant ratchet with hand release.

**Schacht.**—Under the title of the "Auto Runabout," the Schacht Manufacturing Company, Cincinnati, O., brought out a light car patterned somewhat along the lines of the now familiar buggabout, though of somewhat more ambitious pretensions, and showed it for the first time at the last Chicago show. For 1908 the line has been expanded and no less than three models are staged at the Palace show. These are the Model H, listing at \$640; Model K, listing at \$680, and the Model P, listing at \$800. The specifications of the chassis are the same in each instance, a 12-horsepower two-cylinder horizontal-opposed motor comprising the power-plant, while the transmission is of the friction type. Ignition is of the high-tension order, using dry cells as the source of current, while the motor accessories, such as the carbureter, lubricating system and the like, are all of standard pattern and high-grade make. The wheelbase is 65 inches and the weight 900 pounds in each case.

**Speedwell.**—This is another new advocate of the six-cylinder type which is the product of the Speedwell Motor Car Company, Dayton, O., a concern that entered the ranks of the industry last spring and has since built a limited number of cars which have been thoroughly tested out in the interim. The six-cylinder car is a 60-horsepower machine with a 132-inch wheelbase. Its power-plant consists of a standard six-cylinder Rutenber motor, transmission being through a cone clutch to a selective gear-set and shaft drive to a floating rear axle, two sets of rear-hub internal expanding and external constricting brakes being fitted. The use of full-elliptic springs seated on saddles rotatably carried on the axle casting and supporting the frame side pieces through large metal pieces riveted to the frame at the rear permits of hanging the body very low, which gives the car a very speedy look.

**Stoddard-Dayton.**—In preparation for the demand for its cars during the coming season, the Dayton Motor Car Company, Dayton, O., has made plans to turn out 2,000 cars, divided principally among the Model 8-H, 18-horsepower runabout; Model 8-K, 30-35-horsepower roadster, and the Model 8-F, 30-35-horsepower touring car. The Model 8-H will be very much along the same lines as the 7-H, with four inches longer wheelbase, bringing this up to 92 inches. The front axle will be an I-beam forging instead of the tubular form hitherto employed, and the body has been improved by placing the seats further back and lowering them. Model K will also have eight inches additional wheelbase, making it 113 inches, and it will be equipped with a new valve-in-the-head type of motor. Model 8-F has the same wheelbase and same motor, the latter being made entirely at the company's plant. The lubrication has been improved, a continuous circulating system now being employed. When specified, the new touring car is equipped with dual ignition, using a Bosch magneto and accumulators. A six-cylinder model is shown.

**Wayne.**—During the season of 1908, the Wayne Automobile Company, Detroit, Mich., will devote its entire energies to the production of a single model to be known as the "Wayne 30," although this will naturally be presented in runabouts as well as touring types of body. Its specifications are 4 1-2 by 5 1-4 inch, four-cylinder four-cycle vertical motor, nominally rated at 30-horsepower, but having an output largely in excess of this; clutch of the internal expanding type with sliding change-speed gear providing three forward speeds and using the selective method of operation, final drive by shaft. Ignition is of the high-tension type, using unit coils mounted on the dash and accumulators as a source of current. Two sets of brakes, one of the internal expanding and the other of the external contracting type, are fitted. The wheelbase is 107 inches, while the tire dimensions are 34 by 3 1-2 inches front and 34 by 4 inches rear. A five-passenger metal touring body of the popular straight-line type is fitted, the weight all on being 2,400 pounds. The specifications are the same in the case of the runabout with the exception of the weight, which is 2,100 pounds.

**Welch.**—Past years' experience has failed to change to any appreciable extent the Welch ideals of construction and equipment, and the Welch cars for 1908 will not only be practically the same, but no attempt whatever has been made to alter their appearance, the bodies having the same general lines, although they have been enlarged somewhat and made more commodious and luxurious. There has been also considerable improvement in the general finish of the cars. Where the power-plant is concerned, the motor is still characterized by the use of hemispherical polished combustion chambers in the cylinders, integral camshaft and cams, multiple disk clutch running in oil, independent clutch type of change-speed gear and honeycomb radiator, all of which have been features of the Welch cars for the past four years. Each detail of design, material, and workmanship has, however, been brought to a close state of perfection in that time, so that the efficiency of the car has been steadily improved. Two entirely independent systems of ignition are employed as a regular part of the equipment, consisting of a Bosch high-tension magneto on one side and a set of accumulators and coils on the other, the latter acting as an emergency reserve.

### STEAM CARS SHOWN IN FOUR MODELS.

**Lane Steamer.**—For the season of 1908, the makers of the Lane steamers, the Lane Motor Vehicle Company, Poughkeepsie, N. Y., will list no less than four models, two of them being touring cars and two of the roadsters type. The leader of the line is known as Model 8-7, and is a 30-horsepower, seven-passenger touring car. Its power plant consists of a two-cylinder compound steam engine working at high pressure, and a special generator, fitted with the Lane burner. Final drive is by single chain. It is equipped with a straight-line body, has a 119-inch wheelbase, and weighs 3,500 pounds. The next smaller model is a five-passenger touring car and is known as Lane Model 8-5. Its power plant is rated at 20 horsepower and its specifications throughout are the same, with the exception of its shorter wheelbase and lighter weight, these being 97 inches and 2,300 pounds, respectively. These two chassis are also fitted as runabouts and are known as Models 8-3 and 8-2, the former being the 30-horsepower car and the latter the 20-horsepower. The weights are 2,000 and 1,600 pounds, respectively.

### MOTORCYCLES: THE FLEET TWO-WHEELERS.

Aurora Automatic Machine Co., Aurora, Ill.,	1st Gallery 192
Ovington Machine Co., 2208 Broadway, New York,	1st Gallery 215
Reading Standard Co., Reading, Pa.,	1st Gallery 213

**Aurora Automatic Machine Company.**—Motorcycles and motorcycle parts are manufactured by this firm, a number of them being devices on which patents are held. These parts are usually sold to makers who assemble them in their own factories and market the complete machine under their own trade name.

**Ovington Machine Company.**—This firm is the American representative of the well-known F.-N. four-cylinder motorcycle, which is a machine of Belgian manufacture and the only one of its kind on the market.

**Reading Standard Company.**—"R. S." motorcycles and bicycles are made by this firm, which was the first in this country to bring out a motorcycle with mechanically actuated valves. It has numerous other features of merit to attract the attention of the lower of the fleet two-wheel steed.

## MANUFACTURERS EXHIBITING COMMERCIAL VEHICLES ONLY

**Manhattan.**—This is a line of cars built entirely for passenger and freight-carrying capacity—in other words, commercial vehicles, to which the Mack Brothers Motor Car Company, Allentown, Pa., has devoted its entire attention for several years past. The concern is probably better known for its gasoline driven sightseeing cars, which have become a familiar sight in most of the large cities of the country during the past few years. They range from a 12-passenger tonneau type up to the 30-passenger cross-seat type, and are finished in various styles. The bodies are also of various patterns, such as inclosed hotel 'buses, combination passenger and baggage wagons, and the like, in addition to which a most complete line of freight-carrying types are listed, such as stake trucks, heavy delivery wagons, platform trucks, and brewery wagons, ranging in capacity from one to ten tons, all being built on a standard type of chassis equipped with a four-cylinder vertical motor and having side-chain drive. Any type of body is supplied to order to meet the requirements of the buyer.

**Rapid.**—The makers of these cars, the Rapid Motor Vehicle Company, Detroit, Mich., have one of the most complete exhibits of commercial vehicles ever staged at an automobile show. Ten entirely different models are shown, including covered delivery wagons, sight-seeing cars, trucks, opera 'buses, wagonettes, police patrol wagons and telephone emergency wagons. This only comprises part of the list which would be far too great to exhibit complete, so that the company will exhibit a collection of photographs showing the numerous other types of special bodies

that they have built and which are now in actual service. The 1908 Rapid chassis is as close an approach to "fool-proof" design and construction as its designers have been able to evolve after several years' experience in building this class of vehicles. The power-plant consists of a 30-horsepower horizontal-opposed motor of the four-cycle, water-cooled type, and every part of it as well as the remainder of the mechanism is placed in the most accessible position. Every part of the car, with the exception of such accessories as tires, carbureters and the like, is made in the home factory directly from the raw materials.

**Reliance.**—The makers of these cars, the Reliance Motor Car Company, Detroit, Mich., devote their attention exclusively to the manufacture of trucks, and are exhibiting three different models, and up to the present have made but one standard chassis having a capacity of two tons, with a safe overload capacity of three tons, but during the past year have been experimenting with two heavier models, rated at three and four tons and having a safe overload capacity of 25 per cent. For the past three years the two-ton model has been built in lots of fifty trucks at a time, carrying in stock 10 to 12 different styles of bodies and building the latter to order where necessary to suit the specifications of the purchaser. These trucks are of particular interest in that their power-plant consists of a motor of the two-cycle type and their success is evident from the statement of the makers, that 50 per cent. of the purchasers have ordered duplicate cars, a fact that speaks for itself better than any other form of commendation.

# TIRES WHICH ASSIST IN AUTOING'S ENJOYMENT

OR five or six years automobile manufacturers have been making use of the deficiencies of the pneumatic tire to hide the shortcomings and weaknesses of their own product. In happy moments, when the car is locked in its garage and its owner has his feet spread out before a comforting fire, the much abused tire would be accorded the credit to which it is entitled as an aid and a helpmate in the development of the automobile. But in the first race, competition, or tour in which the great expectations of the manufacturer were disappointed by defective castings, inferior steel, inefficient cooling arrangements, or poor ignition, the abused tire was made to bear the sin of it all.

This year the tire has truly come into its own. In at least three of Europe's fastest and most keenly contested races the winners have declared unreservedly that they have not been in any way delayed by tire trouble. In the French Grand Prix an average speed of seventy miles an hour was maintained for over four consecutive hours without any weakness developing in the tires with which the leaders were equipped. Compared with the state of affairs at races but two years previously, the result was stupendous. America has had few opportunities of demonstrating by intensified tests of a few hours to what extent her own product has been improved over that of previous years. Deprived of a long-distance road race, the only speed tests have been on circular tracks, where though less conspicuous than in international road races, the improvement has been no less marked.

For those who have had the time and opportunity of watching cars in the more important national touring competitions, the change during the past season is no less conspicuous. Instead of being able now to take shelter behind the rubber with which his wheels are shod, the automobile manufacturer who puts up the plea of tire trouble lays himself open to the charge of cheese paring. Those most closely connected with the industry know that with tires of proper size for the load they have to bear, attention to inflation, and reasonable care, the old familiar cry on the part of the manufacturer is a self-accusation.

Finality has not been reached, but the progress which has been made is more than sufficient to remove the stigma which has somewhat unjustly been attached to the pneumatic tire since its application to automobiles. Apart from the progress which every firm naturally strives to make in material and methods of construction, new developments appear to be in the direction of quick and reliable methods of changing, non-skid devices, and, later—for the problem is a big one—the development of the most economical type of solid tire for commercial vehicles.

**Ajax.**—Wrapped tread automobile tires are the feature of the Ajax-Grieb Rubber Company. The 1908 lines which are shown differ materially from previously made molded tires, inasmuch as

they bear a cushion of pure Para rubber between the carcass and the tread, varying in thickness from 1-8 to 3-16 inch, according to the size of the tire, and also has two breaker strips between the cushion and the tread, which are declared to absolutely prevent the separation of the tread from the carcass. In curing the tire the carcass is first vulcanized, and the tread, which also varies in thickness according to the size of the tire, is then put on raw and hand-wrapped, after which the whole tire is cured by the open steam process, which toughens the facing and adds miles of wear to the tire. A guarantee of five thousand miles is now given with all Ajax tires, and has proved a great success, not only in the marketing of the tires, but in the guarantee being lived up to.

**Continental.**—Imported from the old-established factory at Hanover, Germany, the Continental Caoutchouc Company, New York, is exhibiting a full range of its wares. The output includes Model A, or standard type with round tread, and Model C, or flat tread tire, specially manufactured for road racing. The tread of this tire is corrugated on its surface and is so designed that about two inches of it is in constant contact with the road surface. It has been used very successfully on powerful racers, and is especially recommended for long-distance road traveling. All Continentals are made in both American and metric sizes.

**Commonwealth.**—The Mitchell punctureless pneumatic tire manufactured by the Commonwealth Rubber Company forms the center of attraction at this stand. The tire is absolutely punctureproof, it is claimed, and cannot be wrenched off or blown out from heat, and is as resilient as any ordinary pneumatic tire.

**Diamond,** prominent among Akron's representatives in the tire section of the show, puts forth the statement with particular emphasis that its line of conduct for 1908 will be competition in the field of quality only. There will be no cutting in prices, no deviation from figures in the net lists, and no preferential treatment for anyone. The Diamond wrapped tread method of manufacture, which has gained for Diamond its present reputation, will be closely adhered to. Quick detachable tires and the Marsh quick-acting clincher rims are the prominent features of the Diamond Rubber Company's exhibit. The tires are shown in the flat tread, regular tread, Bailey tread, and Diamond non-skid tread types. In addition are exhibited the Diamond tire for Fisk rims, also the mechanical Diamond or Dunlop type of tire. A new feature for which great claims are made is the Diamond electric, specially constructed for light electric cars. A dismountable rim which was used to a limited extent in the Vanderbilt race of a year ago, and in later contests with good results, is shown at the Diamond booth. The American rights of this rim are controlled exclusively by the Diamond Company. Two new constructions in solid tires are shown in the wire mesh base and side wire types, both of almost pure white rubber, extremely tough and resilient. This rubber is also used in tires for the buggyabout type of car.

**Empire.**—Red and gray tubes, automobile cases, and a complete line of tire accessories comprise the show of the Empire Automobile Tire Company. The raised oval tread is constructed, the outer surface being made of very tough wear-resisting rubber

that adheres firmly to the fabric and relieves this latter of much of the shock from severe roads. Of the two types of inner tubes, red ones are specially recommended because of their increased thickness and their special process of construction, which prevents deterioration.

**Firestone.**—Two new things which have never before been exhibited at any automobile show are on view at the stand of the Firestone Tire & Rubber Company. One is the 1908 Firestone dual non-skid tread and the other is the 1908 Firestone dismountable rim. The dual non-skid, for use on pneumatic tires, consists of two ridges of rubber extending around the tire. This tread is thicker than the regular Firestone wrapped tread, and the surface of the two ridges is corrugated to afford additional protection against skidding. The 1908 Firestone dismountable, which may be used in connection with any clincher tire, has its dismountable portion held on the felloe by six bolts, the removal of the nuts allowing the tire and clincher rim to slide off in one lateral motion, equal merely to the width of the felloe. There is very little contact of metal to metal, thus preventing the rim from rusting on. It cannot creep around the rim, the dismountable portion having clips fastened to its under side, engaging in slots. In addition to these two novelties, the firm's general line of clinchers and quick detachables is shown, and a distribution of a tasty certificate, entirely new in conception and of special value to owners of commercial vehicles, is made at the Firestone booth.

**Fisk.**—Mechanically fastened tires from the Fisk Rubber Company's factory at Chicopee Falls occupy full attention at this stand, their presentation being made on the three-fold basis of speed, safety, and durability. It is claimed for the Fisk that it cannot possibly come off the rim, whether the tire be inflated or deflated. Fisk clincher tires are made in all sizes, the "Heavy Car Type" being specially recommended for long-wearing quality.

**G & J.**—The big factory of the G & J Tire Company at Indianapolis supplies specimens of all its lines for 1908, none of which show any great departure from those of the present season. Quality is maintained and improved wherever research has shown that it is possible. The raised tread tire produced a year ago, and which has continued to give excellent service, will continue to be an important feature of the Indiana factory. The strong claim made for the G & J oval raised tread is that it has more frictional contact with the road than any other type. Even when slewing round corners the oval surface always remains in contact with the road. The Indianapolis Dunlop tire is made with non-extensible wires cured in the edges of the case, these wires making it impossible for the edges to stretch over or blow off the rim. Both G & J and Dunlop tires are made with Bailey tread, which to some extent prevents side slipping and skidding, but does not give such long service as the regular raised tread.

**Goodrich.**—Representative of the huge output from the Goodrich Company's factory at Akron is a big line of the firm's regular stock of goods. There are few or no novelties, but, what is of more importance to the average automobilist, a continuance of the high standard of the firm. The exhibit consists of the regular Goodrich clincher type in smooth, Bailey, and flat treads. Naturally at a time when quick detachables are attracting wide attention on the part of the automobile public, the Goodrich product in this field is not neglected. An opportunity is given of examining in detail and testing as a time saver the Goodrich quick detachable tires and rims. In view of the success of the firm in the touring competitions of the past season, the Goodrich stand and its contents are examined with attention.

**Goodyear.**—As at last year's automobile show, the principal exhibit of the Goodyear Tire & Rubber Company's stand is the universal rim and detachable tire made up in various types. The firm's new features are a special electric detachable tire and a heavy tourist tire. The electric is used in combination with a special universal rim, made light for the purpose of economy on an electric vehicle. Thus with a 30 by 3 1-2-inch electric tire is

used a 29 by 3-inch rim fitted with tubular side rings, making a much lighter construction than the ordinary 30 by 3 1-2-inch universal rim. This electric tire is made of a special fabric which is very resilient and quite durable. Tests that have been made with it show that it is economical of power, has good wearing qualities and is likely to find special favor on account of the ease with which it may be changed. The heavy tourist tire is made with both flat and round treads, the flat treads being usually used on the rear and the round treads on the front wheels. The flat tread being scalloped, produces a wonderfully efficient non-skid without the use of metal, which generally shortens the life of tires and robs them of some of their resiliency. The heavy tourist is made in the detachable type, is extra heavy and has a good thick inner tube. A full line of clincher, motor truck and motor cycle tires are shown.

**Hartford.**—Conspicuous in the stand of the Hartford Rubber Works Company, of Hartford, Conn., are Hartford, Dunlop and clincher tires and the new Midgley universal rim. The firm's feature, the Hartford quick detachable clincher tire, has a non-extensible wire edge similar to the Dunlop, with a heel on the side which fits into the clinch of the rim perfectly. There is no toe to the clinch on this tire. The tube lies inside the tire exactly as in the Dunlop. The tire will fit any form of detachable rim.

**Leather Tire Goods Company.**—Four features from this firm's factory are the 1908 Woodworth tread, Kant-Skid, leather inner tube, and steel tire shoe. Some improvements have been made in the Woodworth tread by the use of a two-ply chrome leather lining in place of the canvas and bark-tanned formerly used. The shape of the rivet head has been so changed that it flanges out at the base, protecting a larger surface and taking a firmer hold in the leather. The leather inner tube is designed to make the tube unpuncturable and proof against any injuries that can be caused by catching on the lugs or under the beads.

**Michelin.**—The pioneer firm of Clermont-Ferrand, France, now Americanized by the new factory at Milltown, N. J., shows for the first time in America a new compressed tread tire of a remarkable nature. The shape of the tire is such that when mounted on a rim and the inner tube inflated, the rubber on the tread of the envelope is compressed instead of being distended, this compression materially adding to the wearing qualities and general durability of the tire. A cut in an ordinary round tread envelope tends to open and admit water and gravel, to the detriment of the tire and fabric and carcass. A cut in the Michelin compressed tread tire is held closed by the compression of the rubber on the wearing tread, tending to reject instead of admitting sand and water. For heavy road work the Michelin clincher flat tread type of tire is recommended, its broad traction surface giving it a firm grip on the road, which is an advantage in driving and non-skid qualities. The firm's anti-skid type has won for itself a high reputation by being used on the Vanderbilt Cup winner of 1906 and in all the most important events since, with the exception of the Grand Prix, when the compressed tread type was employed. Prominent in the dismountable field is the Michelin demountable rim. The wide margin of security of this rim has been shown by its performance in important automobile races. A quick demountable round tread type made with a stiff wire bead, and which may be easily fitted to any of the well-known detachable rims, will appeal to owners who drive their own cars and wish for ease of removal. All Michelin tires are now made in both American and metric sizes.

**Morgan & Wright.**—Most prominent in the stand of Morgan & Wright, of Detroit, is the improved Midgley universal rim for use with either clincher or Dunlop tires. When it is remembered that this rim will accommodate every make of clincher or Dunlop, as well as every type of mechanically fastened tire but one, that it is of standard measurement throughout, including inside diameter, and has a solid bead, the strong claims of its inventors would not seem to be exaggerated. Naturally the full line of Morgan & Wright tires are on view.

**Motz.**—A non-skid cushion tire, claimed to be as resilient as the pneumatic and made to fit any standard clincher rim, is shown by the Motz Clincher Tire & Rubber Company. Demonstrations are given at the stand of the degree of resiliency of this tire and the method of attaching it to any rim.

**Pennsylvania.**—The changes in the 1908 product of the Pennsylvania Rubber Company are for the most part in material and method of construction. In future the fabric used will be made from Egyptian cotton instead of Sea Island, due to the fact that the former far exceeds the latter in elasticity, and while its tensile strength is no greater, it has been found to resist bursting much more effectively. The fabric is thoroughly impregnated and coated with Para rubber, the tread portion of the tire being composed of a white rubber compound particularly designed to resist wear and abrasion. No change has been made in the shape of the different tires, the flat tread road racing type being particularly intended for use on high-powered cars, as its walls are heavier and tread thicker than the ordinary tire. The Pennsylvania Rubber Company has given particular attention to the manufacture of non-skid tires, and is now marketing one of these equipped with rows of hardened steel rivets extending through a strip of leather into the rubber of the tire.

**Pneu L'Electric.**—A French production, with the backing of an important home concern, is handled here by agents with offices on Broadway. A full line of various types of pneumatic tires are displayed.

**Republic.**—Attention here is drawn to a special type of rim fastening constructed at the Republic Rubber Company's factory at Youngstown, O., the claims for which are that it fits the rim exactly and stays there.

**Swinehart.**—A full display of the regular line of the Swinehart Clincher Tire & Rubber Company is shown on plated rims. In addition are 7-inch commercial, 3-inch dual; a pyramidal, single tube, self-healing clincher pneumatic, and a new cellular tire. The claims for the self-healer are that it is self-healing for all ordinary punctures; can be run flat without injury; there is no friction between inner tube and outer casing; small cuts can be repaired by ordinary single tube repair kit and serious cuts can be repaired by slitting base in center, laying patch inside, coating slit with cement, applying tire to rim and inflating. The Swinehart cellular tire has the same system of fastening to clincher rims as is used on Swinehart solid tires. It has flat tread, is non-skid, and has holes moulded on the slant to prevent picking up gravel stones.

## TIRE APPLIANCES, RIMS, AND MISCELLANY

Allen Auto Specialty Co., 1913 Broadway, New York, 1st Gallery 194a

 Weed Chain Tire & Grip Co., 28 Moore St., New York, 1st Gallery 131

**Allen Auto Specialty Company.**—This concern makes a specialty of tire protectors, tire holders, and the like, a full line of which are shown at its exhibit.

**Gilbert Manufacturing Company.**—Fabric supplies for automobile use are shown in a large variety of forms at the exhibit of this firm. Some of these are the Gilbert patent spare tire case, the Gilbert tire sleeves, tool holders, storm helmets, ponchos and the like, as this concern makes a specialty of everything in rubber fabric, though the tire case is the most popular article of this kind, as it has been on the market the longest and is well known.

**Long & Mann Company.**—"Minute Adjusters," which are claimed to be the best thing ever produced in the shape of a tire tool for clinchers, and also the "L & M" adjusters, for quick-detachable tires, are shown by this firm.

**Midgley Manufacturing Company.**—While the name of Midgley is chiefly associated in the minds of the autoist and the automobile builder, with the special patented rims of the quick-detachable type brought out by this firm, and which have proven so successful in the past few years that they have been on the market, the firm also makes a specialty of indestructible steel wheels and other pressed steel products for various purposes in connection with automobile construction, such parts combining a maximum of strength and durability with a minimum of weight.

**Nathan Novelty Manufacturing Company.**—Tire trunks of special design, adapted to carry both outer shoes and inner tubes, special portfolios of enlarged size to hang from the coat rail in the tonneau and intended for carrying maps, goggles, extra clothing and the like, buttoned tire covers and similar articles are a few of the specialties made by this firm in fabric.

**Newmastic Tire Company.**—Puncture-proof filling for pneumatic tires, known under the tradename of Newmastic, is manufactured by this concern.

**Presto Detachable Rim Company.**—As its name indicates, this firm manufactures and exhibits a novel form of quick detach-

able rim for pneumatic tires which has numerous features of merit.

**Shaler & Company, C. A.**—Tire repairs to be permanent must be vulcanized, as the autoist soon learns to his cost and annoyance after having been inconvenienced and delayed by temporary make-shifts. But hitherto it has been impossible to have a repair vulcanized outside of a shop specially fitted for the purpose. This firm makes a special portable electric vulcanizer adapted to repair all but the very worst damage to an inner tube, the device being shown in operation to illustrate the simplicity of its working. They show their complete line, comprising Types B, C, and D, as well as the different attachments for the various models and a complete line of repair materials.

**Schwarz Wheel Company.**—Wheels for automobiles and heavy vehicles are specialized by this concern. They are built of wood, but by a special method in which all the spokes of a wheel are assembled at one time and under pressure, so that the wheel can be made and shipped without the hub, each of the spokes interlocking with both of its neighbors. The spokes of these wheels cannot loosen and are guaranteed by the makers to stand where all others fail.

**Travers Blowout Patch Company.**—Unlike many of the devices of this kind designed to effect emergency repairs, the Travers blowout patch is intended to be placed inside the tire. It is made of fabric and tire like a tire tread and is equipped with a brass flange to prevent creeping. It is made in three styles: clincher, Dunlop and Fisk, and is guaranteed as an effective repair for rim cuts or blowouts. An improved type, upon which patents have just been granted, is shown for the first time.

**Weed Chain Tire & Grip Company.**—There is not much that can be said of the exhibit of this concern that the showing made therein does not say for itself, for Weed chains have become almost as much a part of the car as the tires themselves. Chains hold an honored place in the tool box of every car and they are greeted as familiar friends at the show by the thousands of autoists who see them.

PROBABLY there is no other branch of the accessory field pertaining to the car which holds such a fascination for the average visitor to the show as does the array of ignition apparatus, most of which is shown in operation by the various makers who devote their attention to the production and improvement of this most essential part of the power-plant. The crackling sparks of the induction coils, the spark plug that will spark under water or oil or anywhere else for that matter and that is always sparking, the inexhaustible dry cells and storage batteries and the dozen and one timers, coils, switches, magnetos, dynamos and other things designed to generate or handle the mysterious force that fires the charge when it occurs at the right time and place, are all matters of absorbing interest to the experienced hand as well as to the tyro who sees many of them for the first time. Improvements are so numerous and so interesting

that neither type of autoist is anxious to miss any of them but wishes to learn of everything new that is to be seen in the entire show, and that is a great deal, as may be seen from the following review of what the principal makers reveal.

**Auto Coil Company.**—This firm shows a line of spark coils and accessories which are well known to the autoist through having been specified on many prominent American cars.

**Connecticut Telephone & Electric Company.**—"Connecticut" spark coils, in both automobile and marine types, special removable lever switches, plug switches, coil-current indicators, and similar specialties form the exhibit of this concern, which has achieved a name for itself within the past few years by the quality and grade of workmanship displayed in its products. The standard unit type dash coils are shown with all number of units from two to six. They are inclosed in mahogany cases, and the terminals are protected, while the switch is also waterproof, thus making them especially adapted for cars in which the coil is mounted on a flat dash and receives no particular protection from rain and snow. The marine coils are shown in one and two-cylinder types, and are of a special form of construction, designed particularly for this work, where it is highly essential that no part of the ignition apparatus give out.

**Dayton Electrical Manufacturing Company.**—The exhibit of this concern consists of a complete dynamo and storage bat-

tery charging system in complete working order. The outfit consists of the well-known Apple dynamo, the No. 12-S switchboard and a portable lead bottle-type of accumulator. The switchboard makes all necessary connections between the battery and the dynamo, and also serves to show the operator exactly the condition of the current supply at all times. The dynamo is friction-driven from a heavy wheel representing the flywheel of an engine, and is charging the battery as in actual service. The timers, coils, and plugs of the system are all in plain sight of the spectator, so that the working of the system may be seen at a glance. It also shows exactly the nature of the spark produced, which is something that interests every autoist, as there are but few who have never experienced ignition trouble in some form or other.

**Heinze Electric Company.**—This concern has long been identified with the manufacture of high-tension induction coils for use in connection with X-ray apparatus, calling for extremely powerful and necessarily well-built coils, so that they are in an excellent position to understand the requirements of coils for ignition purposes, which they have now been making for three or four years past. They are made in interchangeable unit types from two to six-cylinder styles, and are mounted in weather-proof mahogany cases with switch, for mounting on the dash. The line shown is familiar to the average autoist through its being specified as the regular equipment of such a number of well-known cars, while the Heinze coils have also figured prominently in racing events, such as on the Christie front-engine racer in the last Grand Prix in France.

**Kokomo Electric Company.**—This concern makes the well-known line of Kingston coils and also several other ignition specialties, all of which are shown in attractive form at their stand. The coils are made in the standard unit types for cars of any number of cylinders, many of the now-popular six-cylinder type being shown. They also show single-cylinder box coils, motorcycle coils and the Kingston multiple-point switches for automobile and motor boat use.

**Spiltdorf, C. F.**—The Spiltdorf synchronized distributing coil forms the chief object of attraction in the numerous line of ignition specialties exhibited by this old-established firm. It represents the culmination of years of study of the subject of firing a multi-cylinder engine with a single coil and vibrator. This is accomplished at exactly the proper time in each cylinder without any of the detrimental effects usually experienced with a single coil, as a different unit supplies the secondary current for each cylinder. The distributing vibrator is independent from the coil units, being a separate instrument, but is included in the

coil box, being so placed that it may be easily adjusted at any time. The adjusting parts are of the tension vibrator type, with a ratchet screw for adjusting the vibrator point and a thumb screw for adjusting the tension of the vibrator spring, there being no necessity for the use of tools in either case. These new coils are made up in any number of units, and are mounted in the standard type of mahogany cases employed for other Splitdorf coils are made up in any number of units, and are mounted in the prehensive showing of the varied line of ignition apparatus made by this firm.

#### DRY CELLS AND STORAGE BATTERIES.

**American Electrical Novelty & Manufacturing Company.**—This concern is the originator of the numerous "Ever-Ready" specialties, their Ever-Ready dry cells being one of the first on the market, specially made for automobile ignition service. These batteries are made in all sizes, and are put up for both automobile and motor boat use.

**Ampere Manufacturing Company.**—This concern exhibits a line of dry cells for automobile, gas engine, and telephone work, known as the "Best" dry batteries.

**Crown Battery Company.**—This firm's exhibit consists of a showing of the Crown high-grade cells in different sizes and shapes, as well as the different elements of which they are composed.

**Eastern Carbon Works.**—Eastern gas engine dry cells are shown by this concern, which devotes itself entirely to the manufacture of a special type of cell particularly designed for the rigorous service required in automobile work. They also make the Eastern battery connectors, which are guaranteed not to shake loose under the most severe conditions of vibration or jolting. Autoists interested in dry-cell ignition will be able to note the improvements made in the manufacture of these essentials as shown by the Eastern line, the representatives of the latter making tests showing the amperage of their cells, both when new and old.

**Electric Storage Battery Company.**—This concern makes a showing of its line of chloride accumulators for automobile use.

**Geisler Brothers.**—Long life and economy of maintenance are two of the good qualities claimed for the Non-sulphating Storage Battery Igniter, which is the subject of this firm's exhibit. It is said to cost but 50 cents for recharging the accumulators, and they are guaranteed to give a working charge until entirely exhausted, the plates being so formed that they will not disintegrate under the vibration or jolting of a car, and will not sulphate. They are assembled in waterproof cases, and are especially adapted for both automobile and marine use.

**National Carbon Company.**—The showing of this concern consists of the well-known line of Columbia dry cells, which are shown in five different sizes. In addition to this they are also showing the "Red Top Columbia Igniter" cells, which are manufactured especially for automobile use, their composition being the result of several years' study and experience in catering to the wants of this service, which is unusually exacting. In connection with their exhibit they are distributing a new pamphlet entitled "Helps and Hints of the Motor Car," which has just been issued, and which contains a great deal of information concerning this essential part of the car, that will be found of value by every autoist. Copies will be mailed gratis on application.

**National Battery Company.**—Sparker, vehicle, and truck batteries form the exhibit of this concern, a new method of assembling and sealing the sparking batteries having been made in the 1908 models of these accumulators. They are shown in the six-volt, sixty-ampere hour type, and the six-volt, forty-ampere hour type, both of which are operating spark coils and lamps. The National method of sealing, which dispenses with the use of the usual sealing compounds, is also displayed. The complete components of the National are shown mounted on an ornamental panel, from which an idea of the construction is obtainable.

**Witherbee Igniter Company.**—In addition to the well-known Witherbee storage batteries, this concern is showing something entirely new in the shape of a spark plug, which is attracting considerable attention. This, as well as a number of other ignition utilities, have been designed and patented by W. W. Robinson, the concern's mechanical engineer, and are being marketed under the trade name of "Wico." The chief point of distinction about the spark plug is a micrometer adjustment, by means of which the exact distance between the sparking points may be set to any determined width to .001 inch, instead of by guesswork with a pair of pliers, as formerly. The Wico timer is also a new departure, a loose ring always providing a smooth path for the roller and exposing a constantly changing surface of contact to eliminate wear. It operates with metal to metal contact, without noise, and is extremely compact, although it provides about 3-8-inch surface for each contact. The Wico trouble lamp is another compact novelty much appreciated by the autoist, while the Wico plug switches are a novelty that is now being shown for the first time. They are made either single or in gangs up to four, to light the side, gage, and tail lights, also the dome light simultaneously, working on the "touch the button" principle.

#### TIMING DEVICES, SPARK PLUGS, ETC.

**Atwater-Kent Manufacturing Works.**—The exhibit of this concern is doubtless one of the most interesting to be found in the show in the line of ignition apparatus. One of its spark-generating outfits was officially sealed in a glass case, together with six small dry cells to supply the current, after the recording apparatus had been duly inspected by experts. The device is driven from outside by means of a small electric motor, a speedometer and odometer being attached to indicate the equivalent rate of speed traveled and the distance covered during the time the test is on. The latter is intended to demonstrate the reliability and low battery consumption of the Atwater-Kent apparatus. In addition to this, they also show their regular line of spark generators, meters, and switches.

**Herz & Co.**—The Herz ball-bearing timer is one of the chief attractions at the exhibit of this concern, which is chiefly devoted to a showing of timers of various styles. There is nothing so essential to the success of an ignition system as a good timer, and as this firm has made a study of this part of the problem for several years past, the apparatus it shows reveals the results of much careful experimenting. They also show the Pater-Noster shock absorber, which has now been on the market for two or three years past, and has proved very successful. It is a combination of the friction and hydraulic types, the working parts operating in glycerine, and is extremely compact and simple, as well as easy to attach to the car. Some of the other specialties are the new "Oscillum Redivivus," or auxiliary spark gap of improved type, battery connections, patent wire terminals, patent safety switch and electric emergency brake, Puck waterproof switch and others, such as the Herz anti-skidding tires, imported storage batteries, the Motor-Whistle for motor boats, steel-armored ignition cable, French coils, Herz distributors, etc.

**Jeffery-DeWitt Company.**—This firm exhibits the Reliance spark plug and its demonstration is one of the things that will considerably puzzle the average autoist, as one of the plugs is shown sparking under water. To quote the makers, "The Reliance spark plug is the result of the discovery of a phenomenal action of the electric current when discharging from a minute platinum electrode embedded in and brought flush with the face of the insulating block, thereby concentrating and intensifying the spark so that it not only destroys all short-circuiting matter, but prevents its deposit." The Reliance plug is patented in France and Belgium, while U. S. and other foreign patents are pending.

**K-W Ignition Company.**—This concern exhibits what is practically a new system of ignition. It is of the standard high-tension type, but it is novel in that a magneto is employed in connection with a simple vibrating coil. The former is the K-W

magneto, of extremely simple and compact design, and which has been described in these columns recently, and the other essential is the K-W Master Vibrator, by means of which exact synchronism in the ignition is obtainable with any number of cylinders, as there is but one vibrator and the adjustment is the same for all cylinders, thus overcoming the great loss of power in the average engine, due to the lack of synchronism arising from the difficulty of adjusting four or six vibrators to work together. Another specialty made by this firm is the Vim spark plug, which has many features of merit.

**Mosler & Company, A. R.**—The name of Mosler and that of "Split-Fire" plugs have been so long associated as to have become practically synonymous, so that the average autoist knows one as well as he does the other. In addition to this well-known line of plugs, this company also exhibits numerous other ignition specialties of their own exclusive design and construction, and they have prepared an attractive booklet setting forth the details of the Mosler ignition outfits for 1908, which will be presented gratis to visitors or sent on application.

**Triumph Engineering Company.**—This firm exhibits a line of Holsten spark plugs, for which numerous advantages are claimed.

#### MAGNETOS AND DYNAMOS.

**Lavalette & Company.**—This company controls the American patents covering the well-known Eisemann system of high-tension ignition, the magneto being of the type familiarly known as "high tension with coil," in that it generates an alternating current of low-tension which is then passed through a powerful

non-vibrating induction coil and subsequently distributed to the plugs as high-tension current by a special synchronously run distributor forming part of the magneto itself. There have been numerous improvements made in these generators and their accessories during the past year, all of which are exhibited and demonstrated by this firm.

**Remy Electric Company.**—The chief novelty at this exhibit is the new Type F magneto, now being publicly shown by this concern for the first time. It represents the simplest jump-spark ignition equipment that can be installed on a four-cylinder engine and can be installed with a minimum. No coil is employed, and the same magneto is equally applicable to a single or twin-cylinder engine. The complete wiring installation consists of a single primary wire leading to the switch and a wire from each secondary outlet to the plugs. The generator itself is extremely simple, having but one shaft, instead of two, as used on most high-tension magnetos, and being free from the complication of a geared distributor. It is designed to be gear-driven at the same speed as the crankshaft of the motor, the distributor consisting of a hard rubber drum on which are mounted contact segments, brushes conducting the high-tension current to the cables leading to the plugs. A simple push-button switch may be mounted on the steering wheel for stopping.

**Western Electric Company.**—One of the departments of this large concern is devoted to the manufacture of battery charging dynamos and motor-generators, of which examples are shown in their exhibit, together with other specialties they make for the automobile trade.

## LUBRICATING OILS, GREASE, GRAPHITE, ETC.

Dixon Crucible Co., Joseph, Jersey City, N. J.,	1st Gallery 175
Harris Oil Co., A. W., Providence, R. I.,	1st Gallery 149
Miller's Sons, W. P., Long Island City,	2nd Gallery 330
New York & New Jersey Lubricant Co., 14 Church street, New York,	1st Gallery 164

**Dixon Crucible Company, Joseph.**—Graphite as applied to automobile lubrication tells the story of the exhibit of the Dixon stand, and it is a subject at which the makers of graphite in its various forms have been hammering ever since there has been such a thing as an automobile. That is now several years, and in that time they have learned considerable about it, and their salesmen and demonstrators are willing to give the benefit of the knowledge gleaned by the firm's experts to any maker or autoist who wishes to be enlightened on this up-to-date and efficient method of lubricating certain parts of the car.

**Harris Oil Company, A. W.**—To the average autoist oil is simply oil, and nothing more; usually he thinks it ought to do the business of lubricating the motor properly as long as it is oil. Some idea of how many different grades of oils there are, as well as the correspondingly numerous purposes to which they are put, may be gleaned from the instructive exhibit of the A. W. Harris Oil Company, Providence, R. I.—a firm that has long made a specialty of refining lubricating oils for automobile use. The requirements of this service have been closely studied, and as a result these refiners are in a position to supply oils of exactly the nature required for each different purpose on the car.

**Miller's Sons, W. P.**—This concern is an old house in the business of refining lubricating oils, and during the past few years have paid special attention to the manufacture of oils particularly for automobile use.

**N. Y. & N. J. Lubricant Company.**—The exhibit of this firm has been a familiar sight at automobile shows almost since there has been such an institution in this country, and their non-fluid oils are equally well known to the American autoist, as they are

#### LUBRICATING APPLIANCES.

Hancock Mfg. Co., Charlotte, Mich.,	1st Gallery 195a
Pedersen Mfg. Co., 636 First avenue, New York,	1st Gallery 204
Randall-Falchney Co., Sudbury Bldg., Boston, Mass.,	2nd Gallery 340

frequently specified for particular uses. The makers are warning the trade to beware of infringements of their methods of packing and advertising, which are calculated to mislead. Their non-fluid oils are put up in orange-colored cans, and as they are the originators and sole makers of this class of lubricants, this is the only form in which they can be purchased. They are issuing a booklet entitled "The White Boa," which is interesting.

#### LUBRICATING APPLIANCES.

**Pedersen Manufacturing Company.**—Pedersen stands for lubricators, of which this firm shows a number of styles, particularly designed for automobile and motor boat use and finished in accordance with the requirements of such service. They manufacture pressure and mechanical force-feed oilers in any number of feeds, and their apparatus has numerous points of advantage. The pressure types are instantly convertible into gravity feed, or both may be used simultaneously, thus providing a safeguard against breakdown, while their mechanical types are of a particularly ingenious and simple design.

**Randall-Falchney Company.**—The name of this firm and their product, the "B"-Line oil guns and grease, have become inseparably associated to the show-going autoist, while the product itself is so universally used that its makers' recommendation "the handy gun for unhandy places" is one that finds innumerable believers among the autoists of this country. These guns are of high-grade manufacture, all of metal, and are designed particularly with a view to fulfilling the reputation their makers give them, that of being able to put the oil exactly where it is wanted, regardless of the inaccessibility of the bearing, and without wasting it on other parts where it is not wanted.

# TELL HOW MANY AND HOW FAST ARE THE MILES

Auto Improvement Co., 216 Hudson St., New York, 1st Gallery 138  
 Hicks Speed Indicator Co., Atlantic Ave., Brooklyn, 2nd Gallery 333  
 Index Speed Indicator Co., Minneapolis, Minn., 1st Gallery 145  
 Jones Speedometer Co., 2228 Broadway, New York, 1st Gallery 199  
 Loring Auto Appliance Co., 1900 B'way, New York, 2nd Gallery 327  
 Motor Car Specialty Co., 112 N. Broad St., Phila., 1st Gallery 120

Rountree-Stimmel Auto Check, 220 B'way, New York, 2nd Gallery  
 Smith, R. H., Mfg. Co., Springfield, Mass., 1st Gallery 154  
 Stewart & Clark Mfg. Co., 506 Diversey Blvd., Chicago, 1st Gallery 208  
 Veeder Mfg. Co., Hartford, Conn., 1st Gallery 113  
 Warner Instrument Co., Beloit, Wis., 1st Gallery 179  
 Winchester Speedometer Co., 1557 B'way, New York, 1st Gallery 189

**Auto Improvement Company.**—The "Ever Ready" specialties form the subject of this firm's exhibit, and under this title they list a patent self-starting mechanism for automobiles, the Ever Ready speedometer, the Ever Ready carbureter, the Ever Ready vulcanizers, and the Ever Ready tire tool.

**Hicks Speed Indicator Company.**—The instrument shown by this concern is one of the most complete of its kind on the American market, in that it records speeds, trip distances, and total mileage, besides giving the time, as it is combined with a neat clock movement, the face of which forms part of the dial of the instrument, but in no way interferes with the reading of the latter. No less than four sets of ball bearings are used in its construction, and it is built to register as accurately as it is possible for an instrument of this kind to do. It is inclosed in a rectangular, polished brass case, adapted to be fastened to the dash, while the dial face is placed at an angle so as to be plainly seen from any part of the car. The dial is calibrated up to 75 miles an hour and the reading is constant, the hand not being affected by the jolting or vibration of the car.

**Index Speed Indicator Company.**—The instruments marketed by this concern, which were formerly known as the Oliver, are shown in operation, and the makers call particular attention to the flexible shaft-drive—an essential part of all speed and distance-recording devices that is a prolific source of trouble. The index shaft is milled from solid steel rod and made into universal joints, which are connected with a steel wire in such a manner as to give great strength and durability. This universal shaft runs inside a flexible tube, which in turn is inclosed in a brass casing. The steel tube is spaced so as to hold a large amount of graphite for lubrication. The Index adjustable universal bracket is also made of steel and is applicable to any make of car. The instrument itself has now been on the market for two years and has met with considerable success.

**Jones Speedometer Company.**—The Jones Automatic Speed Control Governor is the center of attraction at the exhibit of this company, as it is the very latest thing to be brought out in this field. It is the invention of Joseph W. Jones, head of the company, and through its use the owner of the car may positively control its speed, even though he be sitting in the tonneau. The device consists primarily of a speed indicator, an automatic circuit-breaker, a controller, and an electrically operated air-valve. The operation of this combination of devices depends upon a switch having five contact points, each of which represents a circuit, the switch being automatically operated by the action of the centrifugal governor of the speed indicator. This switch is so arranged that when a speed of ten miles an hour is reached by the indicator it will close the circuit through the first contact point; when the hand reaches the 15-mile mark, the switch closes the second circuit, and so on with the remaining points, which correspond to certain speeds per hour, so that the occupant of the tonneau by merely setting a switch to a certain point can keep the car going at a certain speed, regardless of the desires of the chauffeur, as immediately the speed set is exceeded the ignition current of the motor is automatically cut off by the operation of the circuit-breaker, or by closing the circuit, instead of breaking it, the electrically-controlled air-valve is operated and the air or gas supply to the engine is cut off. Once the car's speed drops again until slightly below the limit marked, as nine miles an hour when set for ten, the device automatically renews the connection, thus acting as a governor.

**Loring Auto Appliance Company.**—Although the Loring Speed Gauge is not new, this is the first time it has been exhibited at any of the New York shows. Several improvements have been made in the instrument during the past year, though the principle remains the same. The dial is now of aluminum, instead of paper, and the protecting glass magnifies the figures several times. The case is now made in one solid piece, instead of with a detachable bottom, as formerly. The Loring Speed Gauge is one of the smallest instruments of its kind on the market, but is extremely easy to read, owing to the unusual length of its dial. It is neat, compact, and permanent in accuracy, while a flexible shaft is arranged to receive the least wear possible, thus making it extremely durable.

**Motor Car Specialty Company.**—This exhibit is the combined showing of the above-named concern and that of William S. Jones, who is their sole selling agent. The chief object of interest is the Phelps vehicle recorder, which is now shown publicly for the first time. It is a device which automatically records the movement of vehicles of all kinds, whether horse or motor-driven. It consists of an aluminum case, securely locked, containing a clock and the remaining mechanism, which records on a sensitized slip of paper. Another specialty is the Lea Speedistimeter, which has been entirely redesigned and greatly improved, while a third is the New Boss gasoline filter designed to be attached to the fuel pipe line of any car.

**Rountree-Stimmel Auto Check.**—As an improvement on the type of speed and distance-recording instruments now on the market, this firm is making one which not only indicates the speed, but prints a permanent record of the speed of the vehicle, the time, and all the stops made while it was out. It is termed the Auto Check, in that it keeps tab on the chauffeur who would take his master's car out without the latter's knowledge, and also provides competent evidence for use in a police court when accused of exceeding the legal speed limit. This traveling tape is 3-4 inch wide and is operated by the clock mechanism. It is marked in vertical lines which represent minutes and hours, while the speed is indicated by the strokes of the pen on the paper, each up stroke representing half a mile. When the car stops the tape is automatically disconnected from the clock and ceases to run until the car is started again. It is impossible to beat the instrument, as this has been amply provided against by the method of its attachment.

**Smith Manufacturing Company, R. H.**—The several important improvements that have been made in the Smith Motometer for 1908 are being demonstrated at this concern's exhibit. The principle of the instrument remains unchanged, but new features have been added. The chief of these is the new maximum speed hand, the vertical dial of the Motometer being particularly adapted to the use of the second hand, as when the latter is not in use, which is effected merely by pushing a button, it is entirely out of sight and does not confuse the driver. When working, this hand indicates the maximum speed reached, being picked up and carried over the scale by the regular indicating hand in its travel and left at the highest point when the latter recedes as the speed again falls off, thus providing indisputable evidence of the highest speed at which the car was traveling. A particular feature of the Motometer is the universal attaching bracket supplied, as this may be assembled to fit any car, whether the knuckle is high or low or whether it is forward or back of the axle.

**Stewart & Clark.**—Special pains have been taken by this firm to show their speedometers in the most attractive manner. For this purpose a special cabinet has been constructed, in which five of the instruments are shown in operation. They are all lighted by concealed electric lights from above, making the dials stand out very plainly, while the instruments themselves are operated by a small electric motor in the lower part of the cabinet and which is also invisible. Each one runs at a different speed, and the steadiness of the indicating hands at the various rates gives the visitor an excellent idea of the performance of these instruments when in actual service. Mounted in the center of the display board is a speedometer of the same make but of twice the ordinary size, which accentuates its details. The cabinet itself is of quarter-sawed oak in Old English finish, and makes a very attractive show piece.

**Veeder Manufacturing Company.**—The name Veeder is so inseparably associated with speed and distance-recording instruments that it is hardly necessary to mention that this is the nature of their exhibit. The Veeder Tachodometer is of particular interest, as it is the only instrument of its class on the market which works on this principle. The indicator, which is curved in the section of a circle, shows the speed of the car from zero to 64 miles, or when required to have close readings at slower speeds; the scale reads from 0 to 32 miles an hour. On the latter, it is only necessary to move a small lever to the right and the instrument is adjusted for high-speed work, the value of the readings then being double and corresponding to the higher scale. Among the numerous advantages of this instrument is the entire absence of springs or delicate moving parts.

### WITH THE UNIVERSAL PROVIDERS.

Brooke Auto Supply Co., 197 Fulton St., New York,	2nd Gallery 302
Miller, Charles E., 97 Reade street, New York,	1st Gallery 218
New York Sporting Goods Co., 17 Warren street, New York,	2nd Gallery 350
Post & Lester Co., Hartford, Conn.,	1st Gallery 216
Wooster, Wm., 88 Chambers street, New York,	2nd Gallery 318

**Brooke Auto Supply Co.**—This concern is a newcomer in the list of New York's universal providers, and as jobbers and retailers show a line of wind shields, license hangers, tops, top covers, tire covers, generators, tire holders, and the like. This company makes a specialty of registering applicants for licenses, whether for cars or as chauffeurs, both for New Jersey as well as for Pennsylvania, and can equip a car with the proper lamp numbers and license hangers.

**Miller, Charles E.**—"Miller," the supply man's stand," is the way the exhibit of this most universal of all automobile providers is generally dubbed by every one at the show, for there is seldom a show in New York without Miller, and what Miller hasn't got in the automobile accessory line is hardly worth having, because if there's a demand for an article Miller is bound to have it. If no one happens to be making it at the time, he will get some one to manufacture it for him. Miller's exhibit suffices to give a pretty good idea of the wide range of things he carries, and a visit to his headquarters is positively a revelation.

**New York Sporting Goods Co.**—During the past few years this concern has added a comprehensive line of automobile specialties to the goods it handles, many of them being exclusive representations in this territory. Horns, lamps, speedometers, tools, tire repair kits, batteries, and a hundred and one other things too numerous to mention are to be found at its booth, including necessities and luxuries.

**Post & Lester Co.**—This firm has always been prominent as one of the pioneers in the general supply line. They have been so progressive that anything in the shape of an automobile accessory that they do not handle on representation—usually exclusive in their special territory, embracing

**Warner Instrument Company.**—Principal stress is being laid by these makers upon the principle of the Warner Auto-meter, and the manner of its drive, in their exhibit. The principle upon which it works is magnetic, and it is the only instrument of its kind on the market. It consists of a circular magnet and a field ring located just above the disk of the dial, so that the tendency of the magnet in revolving is to turn the dial in the direction of its own revolution, this rotation being naturally in proportion to the speed of the magnet, while a hair-spring acts as a controlling force which always tends to return the dial to zero. The strength of this spring increases with the angle of its displacement, so that the dial is marked off in equal divisions throughout the length of the scale. As the magnet acts directly on the indicating dial, there are no intermediaries between the two. The Warner Auto-Meter is driven from the front wheel in the usual manner, but the shaft is of a special type, as is also the drive, using case-hardened spiral gears.

**Winchester Speedometer Company.**—As its name indicates, this concern shows a combined speedometer and odometer, which is exhibited in operation. It is triangular in shape, with a round-faced dial, and is extremely compact. The new Model H is equipped with a maximum or high-speed record hand, indicating the highest speed attained, while the new reinforced case prevents shaft-breakage as well as the other annoyances arising to cause this essential to go wrong. The makers have also perfected an attaching bracket that fits 90 per cent. of the cars now on the market without change, and sum up the improvements made on their speedometer by calling attention to its finish, which makes it "a fine instrument for a fine car."

practically all of New England—they import from the other side, or have made for them. Their imported lines are numerous, and they also have a number of articles made especially for them which they put out under their own name, so that their booth cannot fail to be of interest. Some of the chief lines shown are the Volier horns, Royal De Luxe lamps and Duray goggles.

### ALUMINUM, BRONZE, AND STEEL CASTINGS.

Cramp & Sons, Wm. S. & E. B., Co., Philadelphia, Pa.,	1st Gallery 162
Johnson, Isaac G., & Co., Spuyten Duyvil, N. Y.,	2nd Gallery 348
Light Mfg. & Foundry Co., Pottstown, Pa.,	1st Gallery 178

**Cramp & Sons, Wm. S. & E. B. Co.**—Manganese bronze castings of every conceivable shape for automobile use are specialized by this great shipbuilding house.

**Light Mfg. & Foundry Co., Pottstown, Pa.**—Aluminum alloy castings for automobile and marine motor parts are specialized by this firm, and numbers of the various types of parts specialized for different makes of cars are shown.

### AUTOMOBILE CLOTHING.

Morrison-Mackintosh & Co., Grinnell, Iowa,	2nd Gallery 334
Scandinavian Fur & Leather Co., 14 West 33d street, New York,	1st Gallery 227

**Morrison-Mackintosh & Company.**—The "Grinnell Ristfit" glove is one of the specialties of automobile wear manufactured by this firm and now shown for two or three seasons in succession. It is made in both the special ventilated and the plain unventilated types, the former being covered by a patent. Both styles are made of reindeer leather, which is well known for its softness and pliability. They are made in black, tan and drab, and with the plain back are lined with silk or wool for winter use.

**Scandinavian Fur & Leather Company.**—As this year's first show is coincident with the beginning of cold weather, the autoist's thoughts turn to wishes for warmer outer coverings and this firm is well equipped to satisfy such longings.

## LAMPS WHICH SHOW THE ROAD FAR AHEAD

Badger Brass Mfg. Co., 437 Eleventh Ave., New York, 1st Gallery 111  
 Edmunds & Jones Mfg. Co., Detroit, Mich., 1st Gallery 184  
 Gray & Davis, Amesbury, Mass., 1st Gallery 103  
 Ham Mfg. Co., C. T., Rochester, N. Y., 1st Gallery 139  
 Manhattan Screw & Stamping Works, New York, 1st Gallery 151  
 Rose Mfg. Co., 910 Arch street, Philadelphia, Pa., 1st Gallery 109

Saxon Lamp Co., 530 West 28th street, New York, 2nd Gallery 321  
**HORNS TO HELP CLEAR THE WAY.**  
 Automobile Sup. Mfg. Co., 147 Emerson Pl., Brooklyn, 2nd Gallery 347  
 Gabriel Horn Mfg. Co., Cleveland, O., 1st Gallery 198  
 International Auto Horn Mfg. Co., New York, 2nd Gallery 310  
 Manhattan Screw & Stamping Works, New York, 1st Gallery 151

**Badger Brass Manufacturing Company.**—The exhibit of "Solar" lamps is one of the most interesting of its kind in the show. Four different styles of headlights are displayed and they are shown in four different sizes. After three years' study of the question a special weatherproof finish has been adopted that is indestructible and always remains the same. This firm has also acquired the sole rights to manufacture the Besnard French lamps in this country.

**Edmunds & Jones Manufacturing Company.**—E. & J. lamps are shown in as many different styles as it is possible to make a lamp for automobile purposes and still keep within the bounds of the practical. While intended for ornamental as well as useful purposes, a lamp must first of all be a reliable article and give satisfactory service, and the makers of this line have not neglected the business end of the illuminator for the ornamental.

**Gray & Davis.**—Few concerns in the business of manufacturing automobile lamps have been responsible for a greater number of distinctive styles than are credited to these makers, and their exhibit is correspondingly attractive. Their showing for 1908 is even more comprehensive than in past seasons, and a great many styles of side and tail oil lamps, also acetylene headlights and searchlights, are exhibited.

**Ham, C. T. Mfg. Co.**—Lamps and more lamps, big, little, and intermediate sizes, are shown by this firm, and although its line in the main is similar to that which met with such success during the past season, touches have been added here and there to make the lamps even more attractive looking than they have been in the past. As the makers say themselves: "They are very different looking articles from what they were three years ago."

**Manhattan Screw & Stamping Works.**—"Phoebus" lamps and generators, "Apollo" exhaust horns, flexible tubing, horn screens, tire holders, oil-guns, pumps, and the like are the

specialties manufactured by this concern. They make "Paraobolens," mirror back and lens mirror headlights in a number of types, searchlights on swivel and rigid brackets, limousine square side and tail lamps, and the "Tattle-Tale."

**Rose Manufacturing Company.**—"Neverout" lamps, patent generators, searchlights in both automobile and marine types, combination oil-burning launch lights, and similar lines form the showing of this firm, and as it has been making "Neverout" lamps since early in the days of the bicycle, it is hardly necessary to say anything further for them. The "Neverout" patent safety gas producer is of the hydro-pneumatic type.

**Saxon Lamp Co.**—The *piece de resistance* of this exhibit is a duplicate of the Saxon Model 400 lamp which proved its merits so effectively at the 24-hour races at Morris Park recently, but in place of the bull's-eye portion of the lens there has been inserted a high-grade French clock movement just filling the circular space. In other respects the lamp is an exact replica of those destined for service, with the exception that the brass body has been gold-plated. This ornamental piece will later be presented to the Automobile Club of America.

### HORNS.

**Gabriel Horn Manufacturing Company.**—The Gabriel horn has tooted its way into the affections of the autoist so effectively that it has become one of the best-known articles of its kind on the market and as such scarcely calls for description, except that the makers have so improved on the original that the new Gabriel 28-Chime horn is but a fraction of the size of its prototype and has been bettered in many ways. This firm also shows the Gabriel shock absorber.

**International Auto Horn Mfg. Co.**—This firm is said to have one of the most complete plants for the manufacture of automobile horns in this country, S. Salvini, its president, having been in the business for a number of years.

## SHOCK ABSORBERS: SMOOTHING OUT THE ROAD

Diezeman Shock Absorber Co., Hoboken, N. J., 1st Gallery 142  
 Gabriel Horn Mfg. Co., Cleveland, O., 1st Gallery 198  
 Herz & Co., 203 Lafayette street, New York, 1st Gallery 156  
 Hotchkin, P. N., Mfg. Co., Chicago, 1st Gallery 132

Hartford Suspension Co., 67 Vestry street, New York, 1st Gallery 165  
 Sager Co., J. H., Rochester, N. Y., 1st Gallery 146  
 Supplementary Spiral Spring Co., St. Louis, Mo., 2nd Gallery 359  
 Victor Shock Absorber Co., 1931 B'way, New York, 2nd Gallery 354

**Diezemann Shock Absorber Company.**—The exhibit of this concern consists of a complete showing of the 1908 model of the Diezemann Shock Absorber, together with a number of parts showing the method of its working. In the new models, the metal parts are all drop-forgings of high-grade steel and the arms are provided with universal joints, the latter being fiber-bushed to eliminate wear and rattling.

**Hartford Suspension Company.**—Some very radical changes have been made in the Truffault-Hartford shock absorber for 1908, and the details of these improvements as well as the benefits to be derived from them is the subject of the firm's exhibit. In order to be able to adjust all four shock absorbers on a car so that they will not only act all at once, but all to the same degree, an indicating dial, consisting of a number of figures and an arrow, has been made a feature of the 1908 models.

**Hotchkin Manufacturing Company.**—This concern exhibits both its new model of the Hotchkin Anti-Jolt device, known

as Model 101, and also the former type, known as Model 100. The new model is patterned after exactly the same design as the former model, with the exception that the lugs are placed on the back, so that it may be fastened directly to the frame of the car instead of on the bottom, as previously. The famous Hotchkin "Teddy Bear" is again a drawing card.

**Sager Company, J. H.**—This firm shows the Sager Equalizing Springs, and the success they have met with in the past few years is amply testified to by the growing list of the most representative American cars on which they are used. They have been making springs for many years.

**Supplementary Spiral Spring Company.**—These springs are such a familiar sight in the average rear view of an automobile that neither their construction nor their purpose are new to the autoist. They are covered by patents and the makers are warning the trade and users to beware of infringements, which are not only closely patterned after the original, but are also similarly named.

## COMPONENTS: MAKERS OF AUTOMOBILE PARTS

American & British Mfg. Co., Bridgeport, Conn.,	1st Gallery 125
Brownell-Trebert Co., Rochester, N. Y.,	1st Gallery 219
Cramp & Sons, Wm., S. & E. B. Co., Philadelphia,	1st Gallery 162
F. R. V. Auto Parts Co., 116 Nassau St., New York,	2nd Gallery 325
Gemmer Mfg. Co., Detroit, Mich.,	1st Gallery 193
Gray-Hawley Mfg. Co., Detroit, Mich.,	1st Gallery 190
Hartford Auto Parts Co., Hartford, Conn.,	1st Gallery 150
Kinsey Mfg. Co., Dayton, O.,	1st Gallery 196
McMullen, Roger B., Chicago, Ill.,	2nd Gallery 329
Shelby Steel Tube Co., Pittsburg, Pa.,	1st Gallery 114
Standard Brake Co., 101 West 66th street, New York,	2nd Gallery 335
Standard Welding Co., Cleveland, O.,	1st Gallery 160
Warner Gear Co., Muncie, Ind.,	1st Gallery 176

### RADIATORS: COOLING THE MOTOR.

Briscoe Mfg. Co., Detroit, Mich.,	1st Gallery 163
Haynes Mfg. Co., Detroit, Mich.,	1st Gallery 140
Kinsey Mfg. Co., Dayton, O.,	1st Gallery 196
Metal Stamping Co., 50 Hubert street, New York,	2nd Gallery 307
Whitlock Coil Pipe Co., Hartford, Conn.,	1st Gallery 102

### TOPS: PROTECTION FOR THE PASSENGERS.

Auto Accessories Mfg. Co., Detroit, Mich.,	1st Gallery 123
Duane, W. J., & Co., 1771 Broadway, New York,	1st Gallery 141
Rands Mfg. Co., Detroit, Mich.,	1st Gallery 152
Sprague Umbrella Co., Norwalk, O.,	1st Gallery 194
Troy Carriage Sunshade Co., Troy, O.,	2nd Gallery 258

**American & British Manufacturing Company.**—The chief item in the exhibit of this firm consists of the 1908 model 40-horsepower Herreshoff motors, which are of the same design as the 80-horsepower motor used in the racing motor boat *Den*. They also show a varied line of pressed steel frames and drop-forgings, the workmanship and materials being according to government specifications.

**Gemmer Manufacturing Company.**—Steering gears of improved pattern and known reliability constitute the showing of this concern, which has long been identified with the manufacture of this most essential part of the car. Their designs are characterized by simplicity, ease of adjustment, and the fact that they are not reversible by road shocks, which is an extremely important factor in their make-up.

**Gray-Hawley Manufacturing Company.**—Among the new things shown by this concern are the Autochime Junior and the Midget Autochime. The former is constructed exactly the same as the standard Autochime, except that it is shorter, measuring 2 by 9 inches, and its tone is slightly higher-pitched. It is also designed to be operated by air-pressure in connection with a newly-devised air-valve and produces a powerful blast. The combination Autochime and cutout is another new thing. A few changes have also been made in the 1908 models of the muffler.

**Hartford Auto Parts Co.**—The complete line of this concern is exhibited at the booth of the J. S. Bretz Co., who are New York sales agents for their product. They exhibit a full assortment of Hartford universals and Hartford complete drive sets, the joints ranging in size from those capable of transmitting 10 horsepower up to 100 horsepower.

**Kinsey Manufacturing Company.**—This firm shows a number of important components that enter into the building of an automobile, ranging in size from pressed steel frames down to force-feed oilers. Between these two extremes they show a line of special "Kinwood" radiators, pressed steel dashes, pressed steel hoods, mufflers, fenders, and the like, the construction of which is more or less familiar.

**Standard Brake Company.**—The showing of this concern consists of a most instructive exhibit illustrating the use of cork inserts in brakes, clutches, and other friction devices made by the National Brake & Clutch Company, Boston, Mass. The manner of their fitting, the advantages accruing from their use, and much other information of a similar nature is to be gleaned from the various parts shown.

**Standard Welding Company.**—Special types of detachable, dismountable, and mechanically fastened rims in a number of styles form a large part of the exhibit of this concern, together with a number of special shaped bands, flanges, and inverted rims for various purposes. A tubular automobile steering wheel is another novelty which is shown in various finishes, such as nickel, galvanized, copper-plated, and the like, while some of their standard line consists of auto hangers, brake pedals, control levers, connecting rods, cylin-

ders, gear-blanks, propeller shafts, pinion casings, steering wheels, knuckles and levers, steel frames, and truss rods.

**Warner Gear Co.**—Selective types of sliding change-speed gears, planetary gears, an improved type of steering gear, and a novelty in the shape of a selective side-control lever, which is also an emergency brake lever in addition, constitutes some of the things shown by the Warner Gear Co.

### RADIATORS.

**Briscoe Manufacturing Company.**—Briscoe radiators form the "faces" of such a very large number of the most prominent American cars that visiting their exhibit is somewhat akin to meeting the shadows of old and familiar friends, as the most distinctive parts of many cars are shown here in the shape of duplicates of their radiators. It would be easy to catalogue quite a portion of the American industry from the numerous types of radiators shown here.

**Whitlock Coil Pipe Co.**—The automobile department of this concern has been considerably enlarged during the past year or two and now shows a number of different types of coolers, hoods, and motor manifold connections of a special class of construction and in a variety of designs. These consist of inlet manifolds of copper and brass, steel exhaust manifolds, and other specimens of bent pipe work.

### TOPS.

**Rands Manufacturing Company.**—Tops for touring cars and roadsters, the Rand "Duquesne" style runabout top, folding windshields, enameled trunk racks, tire holders, rubber bow separators, drop-forged fork-brackets, and foot and coat rails are a few of the specialties of which this firm makes a comprehensive showing.

**Sprague Umbrella Company.**—In addition to a complete showing of one of the most complete lines of automobile tops to be seen on this market, and with which the name of Sprague has been synonymous ever since there has been such a thing as an auto top, this concern is exhibiting a novel folding plate-glass windshield which possesses a number of advantages over the majority of types at present in use. Instead of being hinged so as to fold, it works on the principle of the lazy jack and by a slight movement to the right after releasing it comes down in the same plane vertically as when upright. Tops, covers and canopies for every type of car are shown, together with their accessories.

**Troy Carriage Sunshade Company.**—One of the most novel and practical car shields or fronts to be found in the show is exhibited by this concern. It is not alone an attractive plate-glass front of approved type, but also combines a fine brass screen of the same size as the upper half of the front, which is very easily folded out of the way and the screen substituted in a very short time without leaving the driver's seat. There are many occasions when the upper half of the glass front cannot be used, but when some protection would be appreciated, and the screen fills rôle perfectly.

## MAKERS AND IMPORTERS OF ANTI-FRICTION BEARINGS

American Ball Bearing Co., Cleveland, O., 1st Gallery 159  
 Bretz Co., J. S., 1004 Times Bldg., New York, 2nd Gallery 365  
 Hess Bright Mfg. Co., 19th street, Philadelphia, Pa., 1st Gallery 173

Hyatt Roller Bearing Co., Newark, N. J., 1st Gallery 116  
 Standard Roller Bearing Co., Philadelphia, Pa., 1st Gallery 200  
 Timken Roller Bearing & Axle Co., Canton, O., 1st Gallery 118

**American Ball Bearing Company.**—Complete front and rear axles of the ball-bearing type are a specialty of this concern which they show in a number of sizes. These components are completely finished and all ready to install on the car. They are made to makers' specifications, and as they have achieved a reputation for efficiency and durability are largely used.

**Bretz Co., J. S.**—The exhibit of the Hartford Auto Parts Company, Hartford, Conn., is in charge of this concern, who are New York sales agents for its entire line. They also show the F. & S. annular ball-bearings, of which they are the sole American representatives, and the U. & H. magnetos, which are made by Unterberg & Helmle, Karlsruhe, Germany, and are now being imported for the first time. The latter are designed along standard lines and also incorporate some special features, such as a positive starting device.

**Hess-Bright Manufacturing Company.**—A full line of the "H B" or "D W F" annular ball-bearings are shown by this concern, the latter designation being that of the German factory. One of the most interesting features of their exhibit consists of two railway axles which have been taken from a standard passenger coach after the latter had run 65,000 miles. These bearings are absolutely without apparent wear or other deterioration of any kind and serve to demonstrate in a striking manner of what properly made ball-bearings are capable under the most severe service conditions. In addition to the show spaces, parlors have been reserved in a nearby hotel, where the heads of the Hess-Bright Company will be pleased to receive visitors and where suitable freedom from interruption not obtainable at the show can be had to talk business.

**Hyatt Roller Bearing Company.**—Hyatt flexible roller

bearings are a standard part of the equipment of many American cars and their use during the past several years has more than sufficed to make their details of construction, as well as their numerous merits, familiar to the average autoist, so that the queer-looking spirals shown at their exhibit are nothing strange.

**Standard Roller Bearing Company.**—The new and improved Grant roller bearing is the chief thing dwelt upon by this concern in its exhibit. The Grant is said to be the first and original conical roller bearing devised and has given universal satisfaction in service. In the new model for auto work the rollers are made solid and reduced at the ends to form shafts or pins. They are made in all the standard sizes.

**Timken Roller Bearing Axle Company.**—This is a combined exhibit of parts for both pleasure and commercial vehicles, the components in the former category being a No. 8 floating clutch with 12-inch brake drum fitted with double brakes, and designed to transmit 25-horsepower; a No. 6 clutch of similar type, but fitted with internal and external brakes designed for cars weighing up to 2,800 pounds and to transmit up to 45 horsepower through the differential; also a No. 5, fixed hub type, equipped with 12-inch internal single brakes and 14-inch external double brakes. In place of a differential, this last axle is fitted with the Hedgeland Equalizer. All the foregoing are rear-axle units. In front axles, two of the I-beam drop-forged type are shown and one of the straight, plain type of tubular front axles, equipped with the regular type of Elliott knuckles and one-piece forged spindles. An even more complete showing of both front and rear axles for commercial vehicles is made, some of them being of extremely heavy types. In addition to this samples illustrating the entire range of Timken roller bearings from the smallest to the largest is shown.

## CHAINS, CLUTCHES, AND TRANSMISSION APPLIANCES

Baldwin Chain & Mfg. Co., Worcester, Mass., 1st Gallery 161  
 Brown-Lipe Gear Co., Syracuse, N. Y., 1st Gallery 107  
 Diamond Chain & Mfg. Co., Indianapolis, Ind., 1st Gallery 191  
 Gemmer Mfg. Co., Detroit, Mich., 1st Gallery 193

Merchant & Evans Co., 517 Arch street, Philadelphia, 2nd Gallery 357  
 Warner Gear Co., Muncie, Ind., 1st Gallery 178  
 Whitney Mfg. Co., Hartford, Conn., 1st Gallery 106

**Baldwin Chain & Manufacturing Company.**—Chains of all sizes, particularly for automobile use, and sprockets for the same purpose, are the chief items in the exhibit of this concern, which is mainly of interest to the auto dealer and designer.

**Brown-Lipe Gear Co.**—Transmission, steering and differential gears constitute the products of this concern, and they exhibit their complete line.

**Diamond Chain & Manufacturing Company.**—Diamond chains are known wherever a chain-drive automobile is made or used, and as they are the result of many years' experience in chain-making, dating back to the time when even bicycle chains were extremely crude things, the claim of the makers that "Diamond chains drive their cars more miles per dollar cost than any others" needs no substantiation. They are made in sizes ranging from some as fine as watch chains up to those capable of transmitting high powers.

**Merchant & Evans Company.**—This concern, with its wide-spreading business relations and large branches in all the more important cities of the country, is one of the best-known establishments in the metals line in the United States, its name being a byword with engineers and manufacturers. Within the past few years it has gradually become more and more interested in the automobile industry, until now a well-established department devoted to this end forms part of the business. Powell Evans,

president of the company, and most active, has just returned from his third trip abroad in the interests of this department, and in this connection the firm makes the important announcement that it has successfully concluded negotiations for the purchase of the patent rights covering the Hele-Shaw multiple-disk clutch in the United States. Mr. Evans has considerably improved the design of the clutch before putting it on the American market by substituting light steel stampings for the case and other parts which are needlessly heavy in the British original. A housed central spring now controls the pressure with a very simple, positive and easily adjusted regulation, the improved design greatly decreasing the cost of the complete clutch. The company will shortly install a large new plant of heavy presses for its manufacture in property recently acquired near Pittsburgh, and the manufacture of the clutch and other parts will be undertaken on a large scale. Other specialties are a change-speed gear and a complete rear axle unit of special construction, which is the result of more than two years' constant study on Mr. Evans' part to overcome the defects of existing types.

**Whitney Manufacturing Company.**—Whitney chains in all sizes and the Woodruff patent system of keying, which is largely used in the construction of automobiles, form the subject of this firm's exhibit. Many of their types of chains are made under their own patents and are largely specified for auto use by American makers.

## CARBURETERS: THE LUNGS OF THE MOTOR

Auto Improvement Co., 316 Hudson St., New York, 1st Gallery 138  
 Breeze Carbureter Co., Newark, N. J., 1st Gallery 183  
 Byrne-Kingston & Co., Kokomo, Ind., 1st Gallery 171

Hill Mfg. Co., 27 Fuller street, Buffalo, N. Y., 2nd Gallery 338  
 Turner Brass Works, Sycamore, Ill., 1st Gallery 133  
 Wheeler & Schebler Co., Indianapolis, Ind., 1st Gallery 174

**Breeze Carbureter Company.**—This firm exhibits a special type of carbureter that they have been manufacturing for several years past and which represents considerable study of the problems of carburetion during that time, so that its design and construction are of interest to the autoist.

**Byrne, Kingston & Co.**—Carbureters are the chief specialties shown by this concern, but the Kingston carbureter is almost too well known to call for any detailed description, as it is specified as a part of the regular equipment of so many prominent American cars that this would be unnecessary. It is made in a range of sizes to fit cars of any power, from the smallest to the largest, and numerous types are shown adapted to well-known cars and on which it can be placed without any special fitting. They also show a line of the Kingston mufflers in both automobile and marine types.

**Turner Brass Works.**—The Turner carbureter, which is shown in four sizes, is but one of the many specialties shown by this firm, a comprehensive showing of which is made. They also show the Martin multiple-feed lubricator and the Martin gasoline strainer.

**Wheeler & Schebler.**—Schebler carbureters are so well-known through their use on such a very large number of cars staged at the show that it is easy to see more of them on the main floor than it is in the gallery space where they are exhibited. "Schebler" is a frequent answer returned to the query concerning the carbureter fitted to a car, and it would seem to have reached a point where it is almost as staple a fitting on the American car as iron is for cylinders or aluminum for crankcases. The 1908 model forms the subject of the exhibit, but a description would be superfluous.

### HAND TOOLS, JACKS, ETC.

Coes Wrench Co., Worcester, Mass., 1st Gallery 135  
 Oliver Mfg. Co., 213 S. Desplaines St., Chicago, Ill., 1st Gallery 172  
 Noonan Tool & Machine Works, Rome, N. Y., 2nd Gallery 305  
 Patterson, Gottfried & Hunter, Ltd., 146 Centre St., New York, 2nd Gallery 346

**Coes Wrench Co.**—As the originators of the anomalously-named monkey-wrench, and manufacturers of this useful tool for the past seventy-two years, the exhibit of the Coes Wrench Company, is one that serves to show the extremely wide range in which such an apparently simple device can be made, as this firm makes wrenches ranging in weight from four ounces up to 162 pounds, the sizes varying from four to seventy-two inches. For some time past they have been devoting attention to a special type of automobile wrench designed for service in inaccessible places and for durability, as the tool is entirely of steel.

**Oliver Mfg. Company.**—Oliver jacks are known wherever it is necessary to raise an automobile, so that it is hardly necessary to describe them for the benefit of the average autoist to whom they are already familiar.

**Noonan Tool & Machine Works.**—Tools and specialties for the quick repair of automobiles, motorcycles, and bicycles are manufactured by this concern, which lists more than two dozen handy labor and time-saving devices.

**Patterson, Gottfried & Hunter, Ltd.**—This firm has long made a specialty of automobile tool kits in roll form and the line they present is one of the most complete of its kind on the market.

### COMPRESSED ACETYLENE GAS TANKS.

Prest-O-Lite Co., 1904 Broadway, New York, 1st Gallery 155

**Prest-O-Lite Co.**—Prest-O-Lite has become a by-word with the automobilist, so much so that it is practically synonymous with compressed acetylene gas tanks. One means the other, so that it is hardly necessary to explain this fact even to the beginner at automobiling or the new visitor—the man who is seeing his first automobile show, as the polished copper-plated steel tanks which were once such a subject for curious questions are now so common a sight fastened to the side of a car or on the running board that few realize their presence. Prest-O-Lite gas tanks have made themselves indispensable to the autoist, and the same is true of the Prest-O-Tire tanks, which eliminate the annoyance of pumping up large, heavy tires. According to the makers, there are now 35,000 users of Prest-O-Lite and Prest-O-Tire tanks.

### TANKS AND FUEL SUPPLY SYSTEMS.

Bowser & Co., Inc., S. F., Fort Wayne, Ind., 1st Gallery 126

**Bowser & Co., S. F., Inc.**—This firm has simplified the autoist's problem of complying with the fire underwriters' rules regarding the handling of gasoline to such an extent that it is now only necessary to specify one of the Bowser "long distance" outfits of the required capacity in order to be certain, not alone of fulfilling every demand of the insurance companies for the protection of the property, but also to procure as convenient and economical a method of fuel-handling as has ever been devised. Outfits adapted to the capacity of the smallest private garages as well as the largest public establishments are made by this concern, and many of the most prominent garages in the metropolitan district have had the Bowser system installed for some time past, so that the autoist who is contemplating the purchase of such an outfit can readily see it in actual operation as well as the show, with but little additional trouble. One of the new things they are showing is a portable wheel-tank for oils.

### AUTOMOBILE AND MARINE MOTORS.

Brownell-Trebert Co., Rochester, N. Y., 2nd Gallery 316

**Brownell-Trebert Co.**—Automobile and marine motors constitute the product of this concern, the latest models of which are shown in their exhibit. They manufacture standard four-cylinder, water-cooled motors of the four-cycle type, embodying numerous improvements of design and construction that are exclusive. The design is of the valves-in-the-head type, actuated by rocker arms working on a single camshaft, the cylinders being cast in pairs. The timer is mounted on a vertical standard forward, with the carbureter and valve mechanism all on the right-hand side. Lubrication is automatic and of the self-contained type. These motors are made in 4, 6, or 8 cylinders and from 15 to 160 horsepower.

### AUTOMOBILE BODIES.

Quinby & Co., J. M., Newark, N. J., Main Floor 42

**Quinby & Co., J. M.**—Apparently this firm's exhibit is one of complete cars rather than bodies, of which they have made a specialty for a number of years past. Instead of being shown separately, the bodies are mounted on the chassis for which they were designed, and the car is offered for sale as it stands, or orders are taken for duplicates of any of the bodies shown, or according to the purchaser's specifications.

## MISCELLANEOUS EXHIBITS AT PALACE SHOW

Acetovone Co., Niagara Falls, N. Y.,	1st Gallery 147	Masury & Sons, John, Brooklyn, N. Y.,	2nd Gallery 371
Auto Spring Repairer Co., 54 Maiden Lane, New York,	2nd Gallery 375	National Surety Co., 115 Broadway, New York,	Main Floor 57
Auto Pump Co., Springfield, N. Y.,	1st Gallery 168	N. Y. School of Automobile Engineers, 146 West 56th	
Automobile Utilities Co., Boston, Mass.,	2nd Gallery 364	street, New York,	2nd Gallery 311
Balzer, Gus, 1556 Broadway, New York,	2nd Gallery 326	Norris Auto Co., Saginaw, Mich.,	2nd Gallery 363
Bureau of Tours, A. C. A., New York,	2nd Gallery 376	Norton Co., 26 Cortlandt street, New York,	2nd Gallery 348
Clover Mfg. Co., 226 West 58th street, New York,	2nd Gallery 361	Pacific Iron Works, Bridgeport, Conn.,	2nd Gallery 326
Columbia Nut & Bolt Co., Bridgeport, Conn.,	1st Gallery 169	Pantasote Co., 11 Broadway, New York,	1st Gallery 142
Comptoir d'Innovations Pour Autos, Paris, France,	2nd Gallery 351	Perfection Spring Co., Cleveland, O.,	2nd Gallery 349
Consolidated Optical Co., 112 W. 31st St., New York,	2nd Gallery 365	Prosser & Son, Thomas, 15 Gold street, New York,	2nd Gallery 308
Cowles & Co., C., New Haven, Conn.,	1st Gallery	Ralmes Co., 50 Ferry street, New York,	2nd Gallery 366
Daniels, W. Smalley, 52 Church St., Boston, Mass.,	2nd Gallery 317	Spicer Universal Joint Co., Plainfield, N. J.,	1st Gallery 197
Downing, C. J., 54 Warren street, New York,	2nd Gallery 301	Springfield Portable Construction Co., Springfield,	
Demar, J. E., 244 West 49th street, New York,	2nd Gallery 332	Mass.,	2nd Gallery 377
Elite Mfg. Co., Ashland, Iowa,	2nd Gallery 306	Stolt, Oscar S., New York,	1st Gallery 127
Kling, Julius, Optical Co., 48 Maiden Lane, New York,	2nd Gallery 336	Travelers' Insurance Co., Hartford, Conn.,	Main Floor 53
Klauder, Charles E., Philadelphia, Pa.,	2nd Gallery 313	Ventilated Cushion & Spring Co., Jackson, Mich.,	2nd Gallery 309
Krause, Richard E., Cleveland, O.,	2nd Gallery 350	West Side Y. M. C. A. Auto School, 318 West 57th	
Mann Co., Leon, 699 Broadway, New York,	2nd Gallery 353	street, New York,	2nd Gallery 362

**Auto Pump Company.**—This well-known concern manufactures the Spencer power air pump, which is a simple device that can be carried in the tool box when not in use and instantly applied to the engine when it is necessary to inflate any of the tires. The operation is very simple.

**Balzer, Gus.**—The marks that make the car distinctive both in the eye of the law, and of its owner, are specialized by this manufacturer, who makes a specialty of a line of attractive monograms, as well as license pads, numbers, and other marks of identification. They are made in a variety of styles.

**Cowles & Company, C.**—This firm exhibits a comprehensive line of high-grade carriage fittings, one of the novelties specialized being an ingenious locking handle for limousines, landaulets and broughams and which can also be used on touring cars. It is termed the security locking handle, each pair being fitted with locks that can only be opened by the keys accompanying them, as each pair is made with a different combination locking key, similar to a postoffice box key. This concern has also recently perfected a window lock and anti-rattler which is a valuable adjunct.

**Masury & Sons, John.**—The name of this concern is synonymous with that of fine carriage varnishes of which they have been manufacturers for a great many years before the automobile became a factor.

**Pantasote Company.**—Upholstery material forms the subject of this firm's exhibit, and the variety of shades and styles in which it is manufactured are little short of amazing. Almost any desired effect can be produced and any shade matched to contrast or correspond with the remainder of the car's finish.

**Raimes & Company.**—"Globe" liquid and paste metal polish constitutes the line exhibited by this concern. It is

suitable for nickel, silver, copper and brass, and is used both for cleaning and polishing.

**Spicer Universal Joint Company.**—As its name indicates, this firm manufactures a line of universals now so generally employed on shaft-driven cars, which form a large majority of all those in use at present. These joints are of a special type, of which this concern is the originator and maker.

**Springfield Portable Construction Company.**—Building material has reached such a high-water level that in many cases it is now far cheaper to buy buildings of the portable type, all ready to set up, than it is to have them erected under local contract. This applies particularly to private garages, which the above-named firm makes a specialty of supplying.

### DISTANCE RECORD FOR COLUMBUS ELECTRIC.

BOSTON, Oct. 21.—An excellent mileage record has been accomplished for an electric automobile by a run of 100 1-8 miles, made by Charles S. Henshaw with a Columbus stanhope, equipped absolutely according to stock specifications. Starting from Boston, the little car ran out to Gloucester and return, a distance of 74.7 miles, without any trouble. Roads were of a give-and-take nature, macadam predominating, but cobblestones showing their uneven surface from time to time, and a few hills relieving the trip of monotony. On the return to the city the car was in such good condition that Henshaw decided to try for the long distance record, and for one hour ran on the square formed by Arlington, Beacon, and Boylston streets and Massachusetts avenue, at an average of ten miles an hour, until 101 1-8 miles were recorded.

At this stage the batteries showed signs of exhaustion, and although it was still possible to run at seven miles an hour the test was called off. During the country run an average of ten miles an hour was maintained, as is testified by the judges' car.

## TWO MAKES WHICH ARE HAVING THEIR OWN SHOWS

**Berliet.**—The American Locomotive Motor Car (license Berliet) is holding forth independently of either the "independents" or the licensed show, and instead of tenating a niche at either the Palace or the Garden it will reign supreme in a jurisdiction all its own during the period of both shows, including the interim between them. It will be exhibited at the Waldorf-Astoria and will be represented by one of the new six-cylinder chassis, a complete 40-horsepower four-cylinder touring car, and a 40-horsepower roadster on the same chassis as the last named. These three will have everything to themselves at the huge Fifth-avenue hostelry and will be a miniature automobile show of their own. The remaining models will be shown at No. 1886 Broadway.

**Rambler.**—"Two automobile shows are to be held in New York for the display of 1908 models. These are under the control of contesting organizations with neither of which we are affiliated. Therefore, though many strong friends of the Rambler may attend either or both, it has been thought better that the Ramblers be exhibited independently throughout the period of both than at either of the partisan shows." Thus runs the Rambler announcement made by Thomas B. Jeffery & Company regarding its stand on show matters this year. This exhibit will be held during the period of both shows. October 24 to November 9, at the salesrooms of Homan & Schulz, 38-40 West Sixty-second street, and includes a full line of stock models and finely finished chassis.

Now for the Innings of the Annual Shows.

It is one of the penalties of a new industry that at regular intervals of twelve months every person connected with it must have his ordinary routine scattered to the winds. When selling automobiles becomes commonplace, there will be little need for yearly upheavals. Since we are obliged to take things as they are and not as the superior man's superior wisdom would have them be, the person who has for his mission the converting of the classes and the masses from patriarchal methods of locomotion to modern means of propulsion is wise who enters into the movement with whole-hearted energy.

Probably individual firms could sell as many cars for spot cash by holding special exhibitions in their own showrooms and entering into a special publicity campaign as by participating in a show; but the final result to the industry as a whole would be quite different. Shows have another object than transferring automobiles from the hands of the manufacturer to those of the user for spot cash, and that object is an appeal to the people which can only be made by a united, and, to a certain extent, disinterested effort. The super-technical man has too frequently made it known that he does not like the modern spectacular show, and that a plain chassis and plain boards would be more satisfactory.

Directors of the big national shows, however, display true wisdom in making their appeal to the large majority indifferent to

the automobile industry. A trading store display pure and simple is never likely to stir up the emotions of the uninitiated. The efforts in Grand Central Palace and Madison Square, at Chicago and a few other of the important cities of the country, will strike the imagination of the masses as nothing else can, and it is in that power to excite interest that their chief value lies. When the automobile industry becomes a commonplace one there will be no need for shows—for there will be no converts to make.

A Comparison of Risks in Auto and Horse Travel.

It must be admitted by even the most ardent automobile user that accidents with the new conveyance are frequent enough to be deplorable, and there is little question but with systems of more strictly examining into operators' qualifications the number of fatalities might be lessened materially. The same, of course, is true of horse use—to an extent that might surprise the prejudiced advocates of this more dangerous method of locomotion—but as long as the race endures it undoubtedly must continue to be the case that moving about from place to place, by whatever means, will subject the individual to certain hazards he might avoid by resolutely remaining in the home of his birth. A disproportionate popular conception of the automobile accident matter has been rather deliberately fostered by many daily newspapers, which play up in front-page display the mishap occasioned by the machine, while relegating to a few obscure lines the fatality consequent upon a misdirection of horse sense. Yet it seems to be the fact, insofar as statistics on the subject are available, that the horse is responsible for the greater proportion of accidents—even taking into account the present predominance of the horse vehicle.

One has only to look into the records of the coroner's office in any community to find long lists of deaths, resulting year after year from the use—often by women and children—of an animal which is prone to spasms of terror every time a bit of paper blows across the road, or a locomotive, bicycle, or automobile intrudes on the equine vision. Even admitting the present probability that there are twenty horse vehicles to one automobile (the most reliable recent figures indicating about 3,000,000 of the former to 150,000 of the latter) it still would require far less than twenty horse accidents to one automobile accident to place the two means of transportation on a parity as respects safety. And careful estimates disclose something like sixty horse accidents to one automobile accident. The essential unfairness, however, of balancing one horse vehicle against one automobile is found in the greater average mileage and carrying capacity of the latter.

In any sort of ordinary circumstances, an automobile is called upon to carry twice the load five times the distance that would be expected from a horse vehicle. This being the case, is it reasonable to expect the greater travel with the lesser risk? Certainly the liability of individual accident is more likely to bear a proportion to the number of individuals carried and the mileage accomplished than it is to any arbitrary comparison of vehicle numbers. Railroad statisticians recognize and are familiar with a basic unit they term a "passenger mile." Borrowing this, an automobile conveying seven people two hundred miles would afford 1,400 passenger miles against, say, a horse vehicle carrying two people twenty-five miles, affording 50 passenger miles. Surely it is natural that the hazard of one amount of travel should be greater than of one-twenty-eighth as much.

So, if the automobile increases travel, can we expect this to be the case without some accompanying increase in the accidents of travel? Apparently not, if we frankly face the figures. Yet an analysis of these same figures makes it plainly appear that the automobile, while vastly increasing the total of passenger miles, with a related increase in accidents, nevertheless most materially decreases the risk per passenger mile. This, too, is with the conditions as they are—admittedly not all that they should be. With better roads, saner legislation, and increased caution and competence on the part of all road users, much of the risk that is now present will disappear.

**A. L. A. M. LONG ISLAND PRESS RUN.**

The Show Committee of the A. L. A. M. did the job thoroughly on Monday last, conveying several score of press representatives from New York City to the famous Chateau des Beaux Arts, most picturesquely located at Huntington, L. I., where the party arrived with keen appetites for the roast pig luncheon. Incidentally there was some tall traveling in the 1908 six-cylinder and four-cylinder models utilized for the occasion, the field embracing the Pierce (six), Stevens (six), Peerless (six), Packard, Thomas, Lozier, Locomobile, Columbia, White, Studebaker, Autocar, Matheson, Pope-Hartford, Pope-Toledo, Thomas (Detroit), Northern, and Knox, with several interlopers.

**COLONEL GEORGE POPE,**  
Chairman of the A. L. A. M.  
Show Committee.

There were only two speakers, and both of them were good. Col. George Pope, chairman of the A. L. A. M. Show Committee, in addition to a "distributed" speech given below, made timely comments upon the industry in general, the tenor of which was substantially optimistic. Then John C. Wetmore, automobile editor of the *Evening Mail* and the dean of the automobile writers of the metropolitan district, contributed one of

his facetious and versatile talks which put everybody in excellent humor, with a single exception.

The run back to town was done more or less leisurely and the beauties of the Autumn tinted Long Island roads were more thoroughly appreciated than was the case in the somewhat hurried outward journey. The ease with which the 75-mile trip was accomplished illustrated the reliability of the Seldenite array of up-to-date cars.

Besides Col. Pope, Marcus I. Brock and Secretary M. L. Downs were other members of the Show Committee who contributed to the pleasure of the guests. The press department trio, consisting of Harry T. Clinton, Arthur N. Jervis and Henry Caldwell, accepted the occasion as one for pleasure and not for "working" purposes. Charles W. Schroeder represented the Madison Square Garden Company. E. H. Cutler, general manager of the A. L. A. M., was also quietly in evidence.

Among other things which Col. Pope said in his prepared speech were the following:

These 1908 models, which we have had the good fortune to see practically tried out this early, are undoubtedly the finest products in the line of cars yet seen, and they are destined to sell readily.

The business done by the licensed makers during the first six months of 1907 was nearly as great as during the whole of 1906. The sales of the 1907 half-year amounted to \$40,000,000, while for the whole of 1906 they were only \$45,000,000. The sales of the first nine months of 1907 have surpassed the total of 1906 by more than \$5,000,000, and the total business of this year will exceed that of last year by at least \$15,000,000. This is to say that the total business done this year by the licensed makers will show a gain of at least 33 1-3 per cent. over 1906.

The figures justify an optimistic outlook for 1908, as does also the quality of the cars themselves. The American car has rapidly attained the excellence of the foreign product; and it has even demonstrated itself superior for the roads of this country. The industry has withstood the trials of unfavorable weather and the blows of a panicky stock market, and is still in good condition as a whole. Every circumstance warrants confidence in a prosperous future for the conservative maker and dealer.

**CHRISTIE FRONT-DRIVE LOWERS ITS RECORD.**

BIRMINGHAM, ALA., Oct. 18.—On the State Fair Grounds here, Walter Christie's 135-horsepower front-drive automobile has lowered its own record for the mile on a circular track to 51 3-5. Louis Strang, who was Christie's mechanic on the same machine in the French Grand Prix last July, handled the car, Christie being unable to drive owing to his injuries at Pittsburg last month. Barney Oldfield, who for a long time held the mile record with Christie, has now been left behind, the best time of the Green Dragon driver being 3 seconds. Owing to the meet being an unsanctioned one, there is some possibility of Strang's record not being accepted as official by the Racing Board of the A. A. A.

**KULICK'S NARROW ESCAPE FROM DEATH.**

DETROIT, MICH., Oct. 21.—Striving for a new one-mile record on a circular track, Frank Kulick crashed through the fence at the State Fair Grounds, converted the new 120-horsepower Ford racing machine into a pile of junk, and narrowly escaped death, landing in the hospital with injuries that will put him on the retired list for some months. Kulick had been trying for some time to clip a few seconds off Strang's mark of :51 3-5 with the Christie front-drive, and succeeded in reeling off a mile in :49 4-5 at a private trial. The accident happened in rounding a turn, the car crashing through the fence and executing a couple of complete somersaults. The front axle broke loose and went spinning off to one side. Kulick was picked up fully sixty feet from where he started his flight through the air, and hurried to a hospital, where it was found that his right leg was broken in two places. After the accident Henry Ford said he was through with racing.

THE SIX AND FOUR-CYLINDER A. L. A. M. LINE-UP AT THE CHATEAU DES BEAUX ARTS, HUNTINGTON, LONG ISLAND.

# The Safest Way to Store Gasoline

The NATIONAL is the only pump that discharges gasoline at every movement of the crank; it saves one-half the labor and one-half the time to pump gasoline; there is no evaporation or leakage; the tank is buried underground; the pump may be put in the building in a convenient place. It is the safest way because it meets all of the requirements of The National Board of Fire Underwriters.

For a Garage owner the National portable wheel tank will enable you to fill a car quickly by pushing the wheel tank by hand to the car. It is easily handled even in case the car would be at the curb.

The NATIONAL is also adapted to private motorists, also for lubricating oil storage. Ask for catalogue—it will explain all about the National System.

**The National Oil Pump and Tank Co., Dayton, O.**

# THE AUTOMOBILE

VOL. XVII

NEW YORK—THURSDAY, OCTOBER 31, 1907—CHICAGO

No. 18

## What the A. L. A. M. Makers Proudly Present for 1908

It was the "Garden" which first gave a place to the automobile, and when one remembers that modest space in the bicycle show, next the exhibition with its play track and the elated passengers who had their first rides, and the wonderful hill-climbing stunt on the roof underneath the astonished gaze of Diana of the Seville-copied tower, and then the beginning of the real automobile shows, there is a feeling of "home-coming" as you wend your way to the big amphitheater to look at the latest product of the pioneer makers of the country, and one knows that the new models will be displayed pleasingly and comfortably.

From a study of what is known in advance, it would appear that the annual show of the Association of Licensed Automobile Manufacturers, opening on this Saturday night, will give a display of motor-driven vehicles far in advance of anything ever before presented by the American makers, who now challenge, without any hesitancy, comparison with the best efforts of the European concerns, from whom, it is confessedly admitted, much has been learned, though to this information much is now added which enters into the making of the staunch and reliable automobile that in a single day can excel the total mileage of a score of horses, and still be found willing to duplicate the distance if necessary.

The setting prepared by the Show Committee of the A. L. A. M. is "rich, not gaudy," and Director Ball has never done anything better. The terraced garden supplies a setting that is an exemplification of

simplified elegance, the blending of French grays and rich cardinals, interspersed with natural flowers and some statuary, is harmoniously accomplished. The 1908 models, with lustrous bodies of various hues and shining brass and nickel, can hardly fail to have their attractiveness enhanced by the surroundings, for the Garden will scarce be recognized by the frequenters attracted to its familiar precincts by the ever-changing category of events which go to make up its varied career.

For most affairs the Garden has room and to spare, but the increasing demands on the part of automobile exhibitors for space began to be felt three years ago, so that the management has been forced to adopt one expedient after another that would enable it to provide additional floor space within the four walls of the structure. The plan adopted last year of building platforms to overhang the balcony seats, and by which 10,000 square feet of floor space for the exhibition of cars was gained, has again been utilized, while every available square foot of space in the Garden's numerous annexes, such as the concert

hall, restaurant, and basement has been pressed into service. In the concert hall a departure has been made from the decorative scheme prevailing in the amphitheater, by having it as an adjunctory rose garden, set with latticed arbors in green and white. Access to it is through an arched entrance, with double diagonal lattices framed in white, and a central dividing lattice down the center of the room, while the walls under the balconies and back of the stage are finished in the same manner. The bareness of the basement floors and walls has also been appropriately covered, making it a far more attractive part of the show than it was in the first years that it was utilized for this purpose.

In place of the time-honored brass band that has always

been a feature of preceding shows, what the small boy has unflinchingly dubbed "canned" music will be supplied. This is

the introduction of the Telharmonic service in place of the band, and it will be the first time that this electric music will be heard in such a large amphitheater. Special cables have been strung through the conduits of the telephone company in Twenty-sixth street and the apparatus is already installed.

Where the cars themselves are concerned, it is quite evident from advance reports that the six-cylinder note is to be predominant. No less than eleven models of this multi-cylinder type will be revealed, of which eight or nine will be shown publicly for the first time. Though greatly in contrast with former years they have been ready for some time since and have not

been completed just in time to get into the show. Under the new A. L. A. M. rating, which has been followed by the majority of the association's members, they range in size from 42 to 70 horsepower, the minimum cylinder bore being 4 1/8 inches and the maximum 5 inches. For the first time, cars will be rated in odd and unusual figures, such as 43, 45, and 46.6 horsepower, which represent some of the official powers of the six-cylinder models in question, and the contrast between this and the former practise of crediting a motor with an output of 45-50 horsepower, or more widely varying limits, cannot fail to be noticed. Most of these six-cylinder models are to be staged in the shape of seven-passenger touring cars, though there will be a few representatives of the roadster type as well.

Where the remainder of the cars are concerned there will be 33 different types, or rather different makes, of gasoline pleasure vehicles shown, nine different makes of electrics, one steam-driven make of cars, the first complete showing of motor-cycles ever brought together in the country, besides a number of both gasoline and electric trucks, the showing of the former being larger by far than has characterized this end of the

show in former years. But then this is also true of the show as a whole, for as compared to the total of 225 individual exhibitors of last year, that apparently took up every inch of space from basement to roof, the management has been able to juggle with the interior of the Garden so that its present capacity as revealed by a tabulation of the show is something like 325 exhibitors—a number that is said to be the largest ever assembled under a single roof at an automobile show. Yet, for all that, the interior of the Garden as a whole will present a much more open and less crowded aspect than has been the case in the past two or three years when there were considerably fewer exhibitors.

Probably the chief thing to strike the average visitor, who, while observant, reckons not of automobile associations or the ties that bind them, is the striking degree of uniformity that marks the product of the exhibitors. Not that all are alike by any means, nor that they are characterized by a degree of sameness that tends

to make them uninteresting, but the fact that all reveal an air of settled design that speaks plainly of a closely followed policy of conservatism in the draughting room, is unmistakable. In other words, it is amply evident that, so far as the numerous makers gathered in the Garden are concerned, the day of experimenting is long since past and it is no longer possible to find the product of ripe experience at one exhibit and the first stages of haphazard experimenting as its neighbor. This is a respect in which the association of American makers, under whose auspices the Garden show is held, is unique, as, with one or two exceptions, they were all recruited at a time when the industry in general, and automobile design in particular, was in a state of chaos. They emerged from that state triumphant, and in their product as it will be revealed by the show is strikingly displayed the results of organization and co-operation, despite the fact that many of these manufacturers are producing widely divergent types of motor-driven vehicles selling at various prices.

They are a tribute to the American industry, and in this connection it is well to remark that this is the first thoroughly American automobile show that the Garden has housed in its seven years or more of sheltering the power-driven vehicle. If we were half so rampantly patriotic as our cousins of over seas—the Britishers—we would have long since coined a new compound to describe our cars. It would be "all-American"; but unlike its prototype that is used so much in the "Tight Little Isle," and means so little, it would not represent cars made of French or German parts and assembled after having passed the customs barrier. With the exception of a stray parts exhibit here and there that is virtually lost amid the scores that surround it, there is nothing to suggest the existence of such a thing as a great industry of the same kind in several different countries on the other side of the Atlantic. There is not a car of foreign origin in the entire show, and this eighth show marks an epoch.

Probably the chief thing to strike the average visitor, who, while observant, reckons not of automobile associations or the ties that bind them, is the striking degree of uniformity that marks the product of the exhibitors. Not that all are alike by any means, nor that they are characterized by a degree of sameness that tends to make them uninteresting, but the fact that all reveal an air of settled design that speaks plainly of a closely followed policy of conservatism in the draughting room, is unmistakable. In other words, it is amply evident that, so far as the numerous makers gathered in the Garden are concerned, the day of experimenting is long since past and it is no longer possible to find the product of ripe experience at one exhibit and the first stages of haphazard experimenting as its neighbor. This is a respect in which the association of American makers, under whose auspices the Garden show is held, is unique, as, with one or two exceptions, they were all recruited at a time when the industry in general, and automobile design in particular, was in a state of chaos. They emerged from that state triumphant, and in their product as it will be revealed by the show is strikingly displayed the results of organization and co-operation, despite the fact that many of these manufacturers are producing widely divergent types of motor-driven vehicles selling at various prices.

**CHARLES CLIFTON**

## THE A. L. A. M. AND PROGRESS OF THE INDUSTRY

By HARRY T. CLINTON, A. L. A. M. PUBLICITY DEPARTMENT.

**S**TATISTICS show the phenomenal strides made in the manufacture of automobiles and the rapid growth of an industry that three years ago was hardly out of swaddling clothes. In 1899 a few manufacturers had the courage of their ideas and attempted, in the face of adverse sentiment, to make automobiles. At that time the capital invested was \$5,768,000, while the amount of business for that year was \$4,748,011. In 1904 the records show about \$35,000,000 employed to do \$26,645,064 worth of business. For the year 1907 the business done will be four times as much as 1904, or nearly 133 per cent. increase in business each year.

The estimates for this year show that directly and indirectly there is \$171,448,769 invested in the manufacture and sale of automobiles and accessories, while the gross amount of sales of automobiles alone will be over \$100,000,000. To produce this amount of business it requires 58,000 men directly interested in the manufacture or sale of automobiles and 29,500 men indirectly interested, making a total of 108,500 men directly and indirectly interested in the manufacture and sale of automobiles and accessories.

In 1903 the total output of American manufactured cars amounted to \$16,000,000. Of these, \$13,000,000 were manufactured by members of the Association of Licensed Automobile Manufacturers. In 1904 \$26,500,000 were sold; \$21,000,000 by the licensees under the Selden patent. In 1905 the total was \$42,000,000, of which \$32,000,000 were licensed cars, and in 1906, \$59,000,000, with the members who manufactured under the Selden patent doing \$46,000,000 of the total amount.

### Why the Licensed Association Was Formed.

The organization of the Association of Licensed Automobile Manufacturers is well known. The fundamental patent on the compression gas engine, which was granted to George B. Selden, was the basis for its organization. The leading manufacturers and importers in 1903, after a thorough investigation into the merits of the patent, became convinced of its validity and protected themselves, their dealers, and the users of their product, by securing a license. These licensees were the organizers of the Association. From the start, the Association has had two objects—the protection of its members as regards their patent rights and the development of the industry.

From its organization a vigorous prosecution of infringements of its patent rights has been maintained. Some manufacturers, evidently not realizing the liability that they, their dealers, or the

buyers of their cars were assuming, in producing or using cars contrary to the legal rights given a patentee, were sued for infringement. How persistently the prosecution of the test case was maintained is told in the volume of evidence now on record, making it one of the most voluminous in patent litigation. The defense has, however, introduced nothing material that was not known to complainants before the bringing of the suits. Complainants' testimony was closed in January last, and the case would have been ready for final argument this spring if defendant had not asked for additional time for taking surrebuttal testimony. Aside from this test case, many other suits have been brought, mostly against users, for infringement of the patent, and many decrees have been entered holding that it is valid and that defendant had infringed the same. In some of these cases little testimony was heard, in others the contest continued for years. In a few cases defendant was allowed to settle by paying royalty and taking a license, and in some the court has awarded not only costs and damages to the owners of the patent, but has granted perpetual injunctions, restraining defendants from further use of the cars.

### Instrumental in the Evolution of the Automobile.

That the many departments of the organization have been instrumental in the evolution of the automobile to its present standardized condition is shown by the results each department has attained. In the Mechanical Branch, however, the greatest tangible evidence of this progress can be seen. It became apparent, as far back as 1903 and 1904, that to reach a point of perfection in motor car construction some standard form of construction, standardized material, and design would have to be reached, and this could only be done by the mutual co-operation of the larger manufacturers.

The Mechanical Branch was formed for this purpose, and consists of the chief engineers and factory superintendents of the 32 leading manufacturers who are members of the Licensed Association. The keynote of the Mechanical Branch is its experience meetings, interchange of ideas toward co-operative and intelligent standardization, which results in improved automobile design and production, the comfort and convenience of the public, and the general imparting of sound information to the industry and its allied arts and sciences.

The accomplishments of the Branch have been many, resulting in both direct and indirect benefits to the manufacturer and user. The A. L. A. M. screw standard, the adoption of a universal size for all nuts, bolts and screws used in the construction of automobiles has been one of the greatest standards used in any industrial individual enterprise, and the adoption of standard spark plugs and universal formula for computing horsepower rating are of equal importance to the screw standard. In the

A. N. JERVIS. H. T. CLINTON. HARRY CALDWELL.  
THE A. L. A. M. PUBLICITY TRIO.

former the many inconveniences caused by the varying sizes of spark plugs has been eliminated, and the latter is an epoch-making innovation in the industry.

Tires and rims have come in for their share of attention. Not so long since, the tire and rim situation was in an almost chaotic state. Many sizes of tires were in the market—too many for economy or convenience to manufacturer or user. Intelligent interchange of ideas of the tiremakers and engineers of the Branch resulted in a revision of sizes and decreased the number used from 23 to 11, the latter being adequate for all demands.

In the standardizing of steel tubing, rods, magnetos and many other component parts of a car the hallmark of progress is stamped on every car made by the engineers of the Branch.

#### The Experimenting Laboratory at Hartford.

At Hartford a laboratory for exhaustive tests and scientific experiments in metals, oils, rubber and other materials is maintained by the Branch, and the results are not only recognized by the automobile manufacturers of the Association, but are acknowledged in all branches of engineering and by the various Government scientific departments. It must be noted that while the Engineering Branch of the organization has been hard at work, the other branches have not been neglected.

Another feature and one of moment is the Exhibition or Show

#### NO S. A. E. MEETING DURING SHOW FORTNIGHT.

Owing to the comparatively short time that has elapsed since the midsummer meeting of the Society of Automobile Engineers, it has been decided not to hold the annual meeting of that body during the course of the New York shows, as has been customary hitherto. The interval has been too short to permit of the preparation of the necessary papers on subjects of interest to the members as well as to the industry at large, and the annual meeting has accordingly been set for some time during January next, possibly during the Importers' show. The Society of Automobile Engineers is the only organization of the kind in the automobile industry that is without trade affiliations of any nature, and, owing to its independent position, is capable of accomplishing a great deal of good. It is the real purpose of this society to supply an open quorum in which can be discussed any subject of general interest in the making of or allied to automobile manufacturing.

#### A. S. M. E. ANNUAL MEETING IN DECEMBER.

The fifty-fourth annual meeting of the American Society of Mechanical Engineers will be held in the Engineering Societies' building, 29 West Thirty-ninth street, New York, from December 3 to 6. Foundry practice, superheated steam, the utilization of low-grade fuels in gas producers, combustion control in gas engines, tests of producer gas engines, power transmission by friction, and cylinder port velocities will be some of the subjects discussed and on which special papers have been prepared.

Committee. To the first Show Committee of the Association the credit of bringing order out of chaos in regard to automobile shows is due. Prior to that time very little system was used in the promotion of exhibitions. The exhibitors were required to arrange for their own decorations, signs, lighting and display of goods. No thought, care or taste was used, with the result far from artistic or even pleasing, it being a mere hodge podge and jumble of booths, cars and sensational advertising literature.

The committee was the first, and is still the only body, to provide rules to prevent overcrowding of the show by other than the interested public and to exclude mere automobile experimenters from the exhibition. An innovation was the placing of all automobiles of the same nature and power in their appropriate places, making each exhibit complete in itself. It was the first to carry out its conviction that artistic and uniform decorations were the just due of the automobile. This could be better provided for by the management and would insure an artistic ensemble rather than barbarous individual decoration. The thoroughness of the Show Committee is shown in the details of its work. Not only does it provide the decorations, signs, lighting furniture, telephones and transportation of the exhibitors' goods, but a postoffice and messenger service during the week of the show are established, for the exclusive use of all exhibitors and their friends. The Licensed Show is the only one where the profits of the exhibition are rebated pro rata to space rental.

#### Work of the Traffic Department.

Another valuable department of the Association is the Traffic Department. The growth of the industry has been phenomenal. From \$50,000,000 to \$100,000,000 worth of automobiles had to be transported from the factory to the consumer, thus creating a high class of freight. The railroads were unprepared and freight cars for this class of freight were scarce. The Traffic Department, knowing the requirements necessary, pointed out to the railroads the advisability of specially constructed cars. At first only a few were put in service, but at present there are over 5,000 freight cars for the exclusive transportation of automobiles. The department has been instrumental in effecting many new classifications of economic value, both in the transportation from and to the factory.

#### NEW HAVEN'S SHOW IS IN PROGRESS.

NEW HAVEN, CONN., Oct. 28.—The third annual automobile show of the New Haven Business Men's Association in the Second Regiment Armory was opened Saturday night with a parade in which over fifty cars were in line. The parade started from City Hall, headed by a platoon of mounted police, and a large auto truck gorgeously decorated contained the Second Regiment band. The parade through the principal business streets was enthusiastically greeted all along the line of march.

In the machines were Governor Rollin S. Woodruff, of Connecticut; Mayor Studley, Mayor-elect James B. Martin, city officials, exhibitors at the show, any many invited guests. The show is a success and is the largest auto exhibit held in the State of Connecticut.

#### BUFFALO'S SHOW TO BE MARCH 9 TO 14.

BUFFALO, N. Y., Oct. 28.—Secretary D. H. Lewis of the Automobile Trade Association and the Automobile Club of Buffalo is busy mailing application blanks for the eighth annual automobile show of these organizations, which is to be held in Convention Hall from March 9 to 14. Mr. Lewis has had many inquiries from prospective exhibitors. The show is later than usual, and it is the hope of automobile men that they will have better demonstrating weather than they have had during past shows in this city. The opinion of the Buffalo dealers is that the exact time for a local show immediately precedes the opening of the early spring selling season, and March dates suit their city.

# ADVANCES REVEALED BY THE LICENSED CARS

By CHARLES B. HAYWARD.

Y far the greater number of the oldest-established automobile makers which go to make up the body of the great American industry are to be found within the ranks of the A. L. A. M., and on this account one is led to expect that solidity of construction and conservatism of design which naturally follow as a result of well-directed and skillfully organized effort bent on the attainment of a single object—improvement in automobile design and construction. "Old-established," in this connection, does not mean a great deal when held up to the light of comparison with the relative standing of the members of any other well-known industry, but owing to the policy adopted by the Association of Licensed Automobile Manufacturers at its inception, and since rigidly adhered to, its membership roll practically represents what was the flower of the industry at the time of its formation. Many of these may not antedate outside concerns by more than a year or so—others not at all, as some of the very oldest are to be found without the Selden pale, yet the benefits of co-operation are visible in the design and construction of the "licensed" cars as a whole.

## What Is New in Motor Design.

Since the purveyors of automobile news for the dailies still adhere to the practice adopted several years ago—when there was considerable reason for it—of hailing every car shown as an entirely new model, describing it as being infinitely in advance of its predecessor of but a year ago, not alone the public, but many otherwise well-informed autoists are led to believe that the show will be responsible for something entirely different than has been presented formerly. As a consequence, they go expecting to find things very much out of the ordinary—just what the new things may consist of they have no definite conception, as the writers in question, having none themselves, were forced to confine their accounts to generalities. Whether many such confidently anticipated finding motors in an inverted position, or placed on the rear axle, with similarly unlooked-for changes, is hard to say, but one and all are disappointed, for motors, transmissions, and other essentials look just the same as they did last year. And they are the same. Motor design and construction have been brought to entirely too fine a point at the present stage of the industry to have it otherwise, and accordingly improvements are necessarily confined to those matters of detail which do not serve to alter the appearance of the motor, except to the experienced eye.

Motor design may be said to have reached a standard, but it must be borne in mind at the same time, that, even with a standard, there may be varying schools of design, and this is the case where the automobile is concerned. It is merely the old, old story of there being "more than one way to kill a cat," and the designer who advocates valves in the head is quite as confident that he has despatched the feline in the most effective and summary manner possible as his confrère is that he has accomplished identically the same end by placing the valves of his motor in outboard chambers. There are reasons for both of course, and neither is lacking in its good and bad points, of which no one of the many differing designs shown has any monopoly of one or the other. Naturally the important thing is that both do reach the same end, and, in what appears to the layman, to be an equally effective manner. Hence we have motor cylinders cast in pairs and cast separately, with valves in the head, on one side, and on both sides, and the makers who adhered to any particular

type last year have remained loyal to their faith in its efficiency—hence the sameness which disappoints the visitor who expects to see marvels in the way of radical changes. Of course, there are exceptions. Take the new Thomas which will play the rôle of either a taxicab in public service, or a town car in private use. It is a new design pure and simple. For instance, its four cylinders are like some of those of French origin, cast in a single piece, and in numerous other ways it reveals the nationality of its designer. It also has a thermo-siphon system of water circulation. The same thing holds good of the new Winton "Six-Teen-Six," which is a new development embodying numerous innovations, not the least of which is an ingenious method of self-starting on compressed air, while another consists of housing in the valve-operating mechanism entirely. The Selden in two models and the Lozier shaft-driven six-cylinder car are also entirely new.

## Motor Details and Accessories.

It is in the matter of detail that change is to be found and by change, in this connection, is meant improvement, of which evidence is not lacking. In keeping with its relative importance in the internal economy of the automobile motor, the ignition has naturally come in for considerable attention, though it is quite apparent that things have settled down to a standard where this essential is concerned, as much if not more than many other parts of the car. That is, practice is much more uniform in that there are but one or two standards, and the latter vary more on account of the selling price of the car than from the designer's likes or dislikes in this respect. For instance, practically every car shown above a certain price is fitted with dual ignition of one kind or another, a magneto being relied upon for the service end in every case. The fact that the latter may be either of the high or low-tension type is one of the chief differences to be found, though there are occasional instances where both systems are employed on the same motor, the magneto being of the low-tension type. In the great majority of cases, however, high-tension is employed in both systems, and standard accumulator and unit coil outfits are almost invariably employed for the standby, though special systems are employed on some cars, such as the Atwater-Kent on the Thomas Flyers.

On cars above a certain price-limit—and most of the licensed cars come within this category—the magneto has come to form practically an integral part of the motor, probably the Bosch, Eisemann, Gianoli, and Remy figuring most prominently. Where the fitting of duplicate systems of ignition is concerned, there is also a difference to be noted in that there are some exceptions to the practice of making both systems absolutely independent, even to the spark plugs. In these, the same plugs and high-tension wiring are utilized for both sides of the system, an accumulator serving as the current-source with a single coil, usually of the non-vibrating type, acting as a transformer, while the magneto distributor also performs this function for the battery current. The Packard with the Eisemann high-tension magneto is an excellent example of this. Low-tension ignition has not found any new advocates among the licensed cars, though, on the other hand, it has not lost any, this type being represented by the Locomobile with its own special magneto, the Columbia using the Gianoli, and the Matheson and the Studebaker using the Bosch.

## Carburetion and the Essentials of Cooling.

American makers have departed considerably from practice current on the other side where carbureters are concerned, as abroad every maker of prominence takes great pains in evolving a system of his own, so that the carbureters of the better-known foreign makes have come to form a distinctive part of their cars. This is also the case here to a certain extent, such cars as the Packard, Lozier, Matheson, Columbia, Stearns, Franklin, Pierce,

Thomas, and a number of others being distinguished by special devices of their own for this purpose; but, on the other hand, there is a very large number who have been willing to let the responsibility for this essential rest where it rightfully seems to belong—in the hands of the specialist—and have adopted stock types of carbureters, such as in the case of the Haynes, Corbin, Winton, Autocar, Cadillac, Olds, Thomas-Detroit, and others, though this practice is more prevalent among newer cars, most of which are not to be found in the licensed fold. Some of the principal makes of carbureters thus adopted are the Schebler, Holley, Kingston, and a few others. In general, it may be said that the chief aim of the American carbureter maker has been simplicity, in contrast with that of his foreign competitor, and as a result, few of the carbureters seen are distinguished by any unusual or bizarre features. Water-jacketing is employed in a few instances, but usually this is confined to exclusive designs. Though using a stock carbureter—the new Holley of the Venturi tube type—the Winton fuel system is unique in that pressure is employed merely to elevate the fuel from the main tank beneath the frame at the rear to a special auxiliary tank holding a pint or two, and mounted on the dash. This gives all the advantages of the gravity system while still permitting the use of a pressure system, at the same time doing away with one of the disadvantages of the latter—that of having to pump in order to raise fuel to the carbureter preparatory to starting.

The details of the cooling system are something that have come in for more or less attention during the past year, and to the practised eye changes that make for better service and greater efficiency are visible here and there. In this connection, there is a decided tendency apparent to clear the motor of everything that partakes of the nature of a makeshift device, such as the fan belt always has been and always will be. Consequently it has been eliminated in numerous instances, such as the Lozier, Winton, Peerless, Franklin, and others, on which simple types of gear-driven fans have been adopted. A novel piece of construction in evidence on the Peerless is the use of a special one-piece fan stamped from sheet steel. Circulating connections have been simplified wherever possible, and looking back but a few years, it is marvelous to note how much has been learned about such an apparently simple thing as the water circulation. The centrifugal type of pump prevails and, owing to its manifest advantages, change was hardly to be expected here. An innovation is to be found in the adoption of the thermo-siphon cooling on the new Thomas town cars, but, as already mentioned, this is really an exotic product, though as a matter of fact it embodies several features which might be adopted by others to advantage. Radiator practice continues unchanged, the tubular fin type being most prevalent, but with a few scattering representatives of the honeycomb type.

Air-cooling is neither more nor less important a factor than it was at this time a year ago, for, as has been set forth repeatedly in these columns, it has long since proved its worth and graduated beyond the probation class. It is represented by the Franklin, Knox, Corbin, and Waltham-Orient cars and the most striking of these is the first-named, its motor having been completely redesigned since the previous show. It now has spherical-shaped combustion chambers, concentric valves, and phosphor-bronze cooling flanges, beside a number of other improvements, all of which have been described in *THE AUTOMOBILE*. As it is a special design throughout, it can hardly be said to represent a tendency, but a type of its own. Though the weight has not been increased, the power of the motor is greater and the proportion of power to weight correspondingly higher. Both the Knox and Corbin factories are showing what are practically replicas of their familiar designs with water-cooled motors.

To sum up the subjects of motor design both as concerns the foundation of the motor itself, as well as its accessories, there are one or two decided tendencies noticeable. Probably the most prominent of these is the largely increased use of ball bearings, such cars as the Lozier and Stearns incorporating this type of

anti-friction bearings in such a number of their moving parts as really to entitle them to the nickname of being "ball-bearing" cars, though they are merely representative instances of the very general advance noticeable in the adoption of this class of bearings. The latter first made their presence apparent in the gear-set and have since become so universally used for this essential that a change-speed gear with plain bearings is indeed a rarity at the present day. But ball-bearing crankshafts and camshafts have since become common, and this is also true of the gear-driven cooling fans now a feature of such a number of cars. Simplicity and higher power with less weight are also noticeable, though it may be said that these incorporate in themselves all the other improvements, as they represent the end sought by the designer.

#### Tendencies in Transmission Practice.

Though at first sight it would appear as if the adoption of the multiple-disk type of clutch had been very general, observation reveals the fact that the conical type has by no means disappeared, and, in addition, there are a number of special types extant. For instance, the Royal Tourist, Pope-Hartford, Thomas-Detroit, and Columbia still stick to the cone, some with the addition of cork inserts and others without, while the Walter employs an inverted conical type. Where special types are concerned, the Peerless and Stearns use an internal-expanding clutch, the Elmore two-cycle an expanding ring type, and the Haynes a band, while the Cadillac and Hewitt still employ a planetary gear-set. This is also true of the lighter of the two Northerns. But the number that employ a multiple-disk type of clutch is comparatively large, including such makes as the Thomas Flyers, Franklins, Lozier, Pope-Toledo, Stevens-Duryea, and the new Selden.

Coming to the next step in the transmission, the adoption of a sliding change-speed gear of the selective type has become very general—in fact, for cars above a certain size it is almost universal, while it is also to be found in numerous instances on those of lighter powers, the chief difference being in the number of speeds provided. For instance, such cars as the Oldsmobile, the air-cooled Corbin, and the lighter Selden model, as well as the new Winton six-cylinder, are equipped with three speeds forward. The great majority of the larger cars are provided with four forward speeds, though exceptions are to be found here and there, and the same is true where some of the smaller ones are concerned, such as the Locomobile, which is now identical in this respect with its high-powered brother in having a four-speed selective gear-set. The progressive method of operation has been all but eliminated and appears destined to be less and less a factor as time goes on, except in the case of such special systems as the Packard, in which the gear-set is placed on the rear axle and under the same housing as the bevel drive and differential. The larger of the two Northern cars still employs this form, and this is likewise true of one of the models of the Studebaker. Both the Northern and Cadillac still retain the planetary change-speed gear on their smaller cars, and one of the heavy touring cars of the latter make is also thus equipped.

There have been defections from the list of side-chain-driven models, or, to put it more correctly, additions to those that are shaft-driven, as some prominent advocates of the former who have never built any other type of car than chain-driven have still retained the latter, though bringing out shaft-driven types. Instances of this are to be found in the case of the Lozier and the Apperson. As was the case at the last Garden show, the most advanced type of transmission is to be found on the Columbia gasoline-electric, which is a law unto itself, combining, as it does, the standard Columbia gasoline motor with a special type of electric transmission which embodies many points of merit. It has been made the subject of considerable study and has been very cleverly worked out, so that the control has been simplified to a degree akin to that of a street car, the driver having five forward speeds available.
